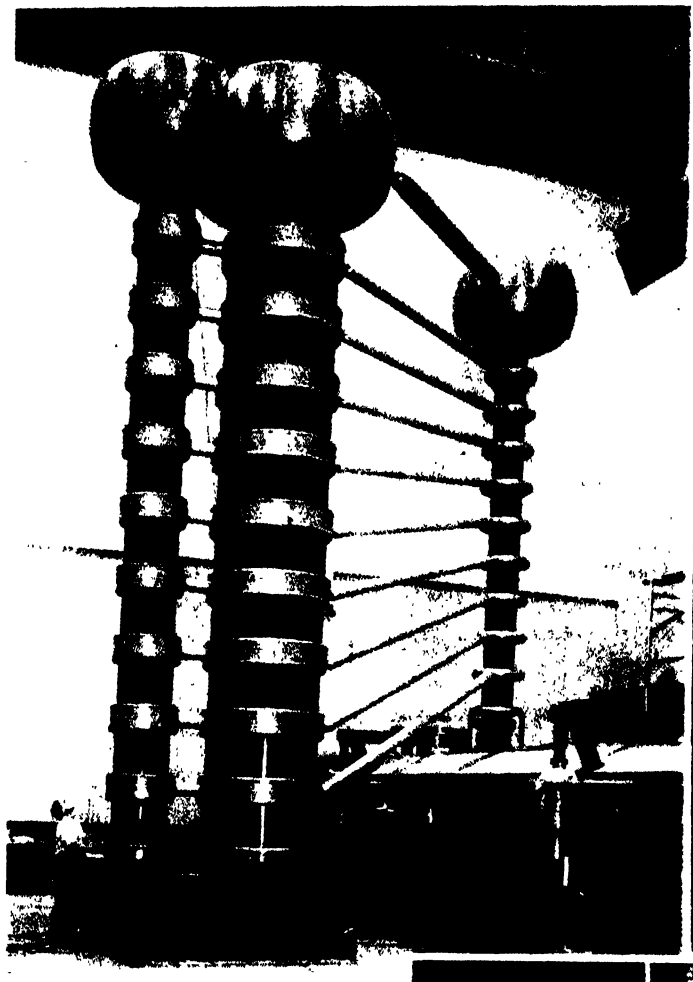
VOLUME 20 JANUARY 10, 1942 NUMBER 1

Industrial Research in the United States during 1941

WILLIAM A. HAMOR

Mellon Institute, Pittsburgh, Penna.

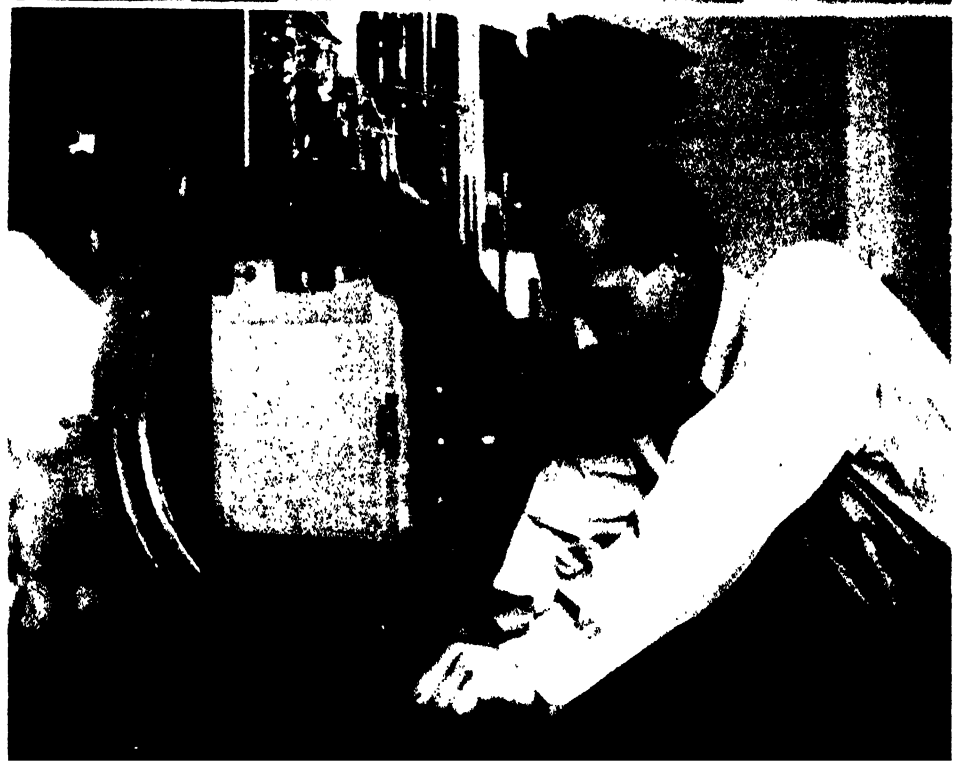
The model of much of the industrial research of the United States is contrived to contribute to national defense, to bring about improvements in raw and finished materials therefor, to uncover succedanea for scarce goods, to develop speedily needed new processes and products. And in all this work the progress has been great, especially from the standpoint of equipment and supplies dependent upon metals, rubber, synthetic resins, textile fibers, foods, chemicals, and petroleum. The obvious national requirements and the stimulating encouragement of federal agencies such as OPM have brought about a surpassing year of research in American industries.



The purpose of this article is to present the important increases during 1941 in interpretative and useful wisdom coming from scientific investigations for American technology. In preparations for national defense, as in warfare, the fundamental aims of industrial research do not change in general, but its philosophy and emergent issues may be altered materially for economic and military reasons. In all the major American branches of manufacture there is intense activity; in some fields there is the necessity for secrecy. A subsequent discourse will deal with industrial research in foreign countries during he past year.

THE total expenditure for all basic production research in the United States in 1941 was about $275,000,000, or approximately 25 per cent more than in 1940. The National Resources Planning Board has reported that American companies spend 6 per cent of their net income on industrial research and have increased their investigational personnel 41 per cent in the past two years, based on a survey of 2,350 companies employing 70,033 persons engaged in research. During 1941, $117,490,000 were expended for scientific research by 1,008 American manufacturers. Of the companies included, 49 per cent gave a larger investigational budget than in 1940; 43 per cent, the same amount. According to the 1941 research budgets of 20 representative manufacturers they have spent 2 per cent of gross income from sales of nondefense products.

About 200,000 products have come from researches in the Nation's chemical laboratories since 1914. Over 39 per cent of the chemicals now listed by Monsanto were not made a decade ago. Eastman's research appropriation has increased from almost nothing in 1912 to $5,000,000; during 1929–39 Eastman's employment rose 75 per cent and $19,000,000 was added to the annual payroll. Johns-Manville is spending close to $1,000,000 a year in research. The du Pont researchers total 1,400. The cost of du Pont's construction work for 1941, both company and governmental, amounted to $213,000,000. Ford markets over 30 by-products valued at $20,000,000 a year. At Detroit Edison the annual value of material reclaimed is $35,700 per salvage department employee. Pullman and Pennsylvania Railroad joined New York Central and Chrysler in Railroad Rolling Stock Patents to expand and carry on train-car research initiated in the Chrysler laboratories. Thirty-five out of 113 trade associations affiliated with the National Association of Manufacturers conduct research; the median budget is $25,000, and two associations spend more than $100,000 a year. Seventy-four research associates, representing 25 associations, are stationed at the National Bureau of Standards. Plans have been perfected for the bureau's new $600,000 materials testing laboratory. The volume of requests for the establishment of standards covering manufactured products has increased 50 per cent. Twenty-two companies formed the National Aircraft Standards Committee.



Three hundred agencies are sponsoring 810 institutional research fellowships and other grants. State universities employ about 2,100 chemists; experiment stations, 400; city-controlled educational institutions, approximately 200. Around 16,000 chemists, 15,000 engineers, 2,500 physicists, and 2,000 metallurgists are engaged in systematic industrial research. Close to 2,000 scientists are at work for the National Defense Research Committee in institutions and laboratories. Records for 1941 show that 4,472 chemists were graduated with the B.S., 910 with the M.S., and 723 with the Ph.D.—a total of 6,105. The chemical engineers for 1941 were 1,709 B.S., 183 M.S., and 23 Ph.D.—1,915 in all. And yet there are not enough men of these types. It is estimated that 1,400 out of 4,100 physicists are investigating problems of national defense. An extensive research in defense took 150 physicists from 25 universities to the M. I. T. Radiation Laboratory. Two hundred and fifty physicists were graduated; there is need for over 1,000. Metallurgists and electrical and mechanical engineers are also scarce. Pure scientific research has been decreasing in the universities, and their total resources for pure science do not reach $20,000,000 a year. More than 30,000 boys and girls, members of junior science and engineering clubs, carry on spare-time laboratory experimentation.

Research laboratories use about 5,000 chemicals and require in their operation 25,000 different instruments; they are facing the necessity of finding many substitutes during the emergency. A wave of fresh research has therefore swept through the field, dusting out some of the

Below. Gasoline consumption meter used by the National Bureau of Standards for the accurate measurement of fuel burned by cars under test.

At the National Bureau of Standards. *Above.* High-voltage laboratory. X-ray generator unit is incased in central column. Voltmeter is in column to left. The column on extreme right is one of three x-ray tubes used for standardizing dosage meters and for exploratory work and cooperative studies with the National Cancer Institute. The generator can deliver x-ray excitation current of 26 milliamperes at 1,400,000 volts. *Right.* Photochemical study of sheet materials. Light, after passing through filters to remove radiation of undesired wave lengths, strikes the sheet held in contact with the thermostated aluminum backing by air pressure. The backing removes heat resulting from light action or light degradation, thus eliminating the heat effects which usually interfere in such light studies. The moisture and oxygen content of the air around the samples of plastics and similar materials is also controlled and varied.

C.; Telephone, Republic 5301; Cable, Jiechem (Washington). Advertising Department, 332 West 42nd St., New York, N. Y.; Telephone, Bryant 9-4430. Entered as second-class matter at the Post Office at Easton, Penna., under the act of March 3, 1879, as 24 times a year on the 10th and 25th. Acceptance for mailing at special rate of postage provided for in Section 1103, Act of October 3, 1917, authorized July 13, 1918.
Annual subscription rate, $2.00. Foreign postage to countries not in the Pan American Union, $0.60; Canadian postage, $0.20. Single copies, $0.15. Special rates to members.
No claims can be allowed for copies of journals lost in the mails unless such claims are received within 60 days of the date of issue, and no claims will be allowed for issues lost as a result of insufficient notice of change of address. (Ten days' advance notice required.) "Missing from files" cannot be accepted as the reason for honoring a claim. Charles L. Parsons, Business Manager, 1155 16th St., N. W., Washington, D. C., U. S. A.

dark corners. Equipment makers are supplying increasingly better tools to the industries and their workers. On July 1 two New York stations commenced commercial television broadcasting. Radio waves about 20 inches long (600 megacycles) form fingers for detecting airplanes at night or in fog. In Seattle, where the first major dress-rehearsal blackout was staged, infrared photography was tested with success. The electron microscope and the cyclotron have opened up new fields for research endeavor. There are in operation throughout the world nearly 40 cyclotrons of various sizes and 24 of these devices either were built or are being operated by specialists trained at the University of California. The betatron is a new electron-hurling machine. Hindrances to research through lacunae in 1940 and 1941 foreign periodicals have arisen but are much less serious than abroad. Microfilming is assisting in keeping unbroken the record of scientific investigation.

TVA FROM OEM

Checking electrolytic plates in the production of manganese, Electro Manganese Co., Knoxville, Tenn.

Defending the Health of Workers

The widening of the scope of Air Hygiene Foundation led to its new name, Industrial Hygiene Foundation. The budget for industrial hygiene in the National Institute of Health is close to $500,000. In general the country is well prepared to cope with health problems in war industries.

There are approximately 300,000 accidental injuries to the eye in American industry every year; the cost is approximately $33,000,000. "Three-dimensional seeing" is a way of painting plant machinery in lighter, brighter colors so that eye fatigue is lessened. Music over telephone wires is helping employees in routine factory jobs. Air-conditioning units are going into naval vessels; electrostatic precipitation is in use in several conditioners; air-conditioning systems are deodorized by activated carbon. The U. S. Bureau of Mines is studying supersonic means of clearing contaminated atmospheres and is continuing its researches on respiratory protective equipment. A. S. A. standards define the amounts of carbon monoxide, hydrogen sulfide, carbon disulfide, and benzene which may be permitted in factory air without harm to workers. The toxicology of oxides of nitrogen has been investigated. Protective measures to reduce the hazards of hydrogen selenide were discussed. The National Bureau of Standards has studied the hazards of mercury vapor in laboratories. A meter evolved at the bureau warns of unsafe conditions in handling radium.

Research indicates a tendency of bituminous coal miners to develop presilicotic and silicotic lung changes after prolonged employment. Examination of 49 men working with fuller's earth disclosed pulmonary alterations, differing from those observed in silicosis. Findings in an x-ray survey of two calcimine plants have revealed a substantial hazard. Investigation has shown that cement dust is nontoxic and that extended periods of employment in high concentrations have little or no effect. Researches were continued on the physiological aspects of arc welding. There appeared studies of workers exposed during the manufacture of Ledloy and of atmospheric concentration of lead fume associated with forging, welding, and oxygen-cutting of lead-bearing steel. Inspection of 27 lead storage battery plants in Illinois showed excessive air contamination by lead, but no cases of plumbism severe enough to cause disability were seen among 766 men employed in 6 lead storage battery factories. The prevention of chronic manganese poisoning can be accomplished by the use of effective control measures against the inhalation and ingestion of manganese compounds. The Bureau of Mines has emphasized the need for developing efficient methods of fighting fire and preventing explosions in plants producing or handling aluminum, magnesium, or zinc powder or scrap. High-melting coal-tar pitch in granules is especially effectual in extinguishing magnesium fires. Pyrene G-1 powder is intended for combating magnesium fires. A mixture of sand and powdered calcium or magnesium carbonate has been recommended for smothering magnesium-thermit.

An automatic carbon disulfide recorder was announced by American Viscose. A safety program begun 4 years ago in plants represented by the Cellulose Plastics Manufacturers' Association has cut lost-time injuries. Dermatitis was found among workers who handled viscose caps shipped in a fluid containing *p*-chloro-*m*-cresol. A survey of airplane plants employing over 100,000 men has brought out that there are many skin hazards, principally from cutting oils, thinners and solvents in paints and "dopes", plating and rustproofing of metals, fluxes in welding, and solvents for cleaning and degreasing. Experience elsewhere has demonstrated there are no health hazards in solvent degreasing if the unit is properly designed, installed, and operated. Nitroparaffins require precautions for their safe handling. Acute oral toxicity of acetic, monochloroacetic, dichloroacetic, and trichloroacetic acids has been investigated; monochloroacetic acid is the most toxic of the group. Studies have been continued on poisoning by benzene and its homologs. Mitts and Practi-Kreme are skin-protectives.

Progress in Mineral Technology

The U. S. Bureau of Mines has reported on alunite resources, limestone and dolomite, gypsum, Iceland spar and optical fluorite, froth flotation and agglomerate tabling of micas, treatment of Alabama graphite ores, and concentration of low-grade manganese ores. TVA is experimenting with clay as a source of alumina; similar research is being conducted at Columbia University.

Santocel is chemically puffed sand, a heat insulator and bulking agent. Celite 340 is a chemically treated and air-separated diatomaceous silica. Silicair is a sound insulation based on diatomaceous earth. Silica aerogel is under development as heat insulation. Cerastone is a processed sandstone for laboratory table tops. A grinder of feldspar and other materials has found that granite liners give better service than Belgian silex and some operators have discovered that steel balls

and rail liners cause less serious contamination than had hitherto been supposed. With the exception of industrial diamonds, the United States can attain self-sufficiency in all necessary abrasives. The cataphoretic velocity of purified, colloidal, mono-disperse fractions of bentonite increases with decreasing particle size; with constant particle size it decreases with increasing concentration. Mississippi bentonite is useful in preparing molds for casting metals. Florite desiccant is a Floridin drying material in regeneratable granules. The beneficiation of bauxites is under investigation. Thermally activated bauxite is used as a decolorizer in sugar refining. More careful mining and washing have characterized the clay industry in recent years. In Georgia nonwhite clays are bleached by zinc and sodium hyposulfites. Calcite for optical purposes is being mined in New Mexico. Barite deposits are of widespread occurrence in Nevada but there are few producing properties. The presence of high-grade antimony and tungsten ores has been uncovered in Idaho. The use of ferrosilicon in sink-and-float processing of iron ore is being tried. Molybdenum is being recovered from copper sulfide concentrates by Anaconda, which company has installed a new process for treating Montana manganese ore. Of three projects in Oregon, Wyoming, and Montana, two have been deemed valuable reserves of chromite. The chromite of Alaska is also of promise.

Improvements in equipment and methods of mining have continued. The trend in excavating for metal mining is toward electrification of shovels. Electric transportation, adopted at some of the larger mines, has resulted in reduced costs. Belt conveyors have proved successful in situations unfavorable to rails. The electric self-propelling churn drill dominates blast-hole work. Black powder is no longer employed in blasting in open pits, principally because of the better safety attained through the use of dynamite.

Apparatus for slacking test of coal (in foreground) in a laboratory of the U. S. Bureau of Mines at Golden, Colo. The station at Golden has been active in studies of combustion and general utilization of the low-rank western coals.

Research Accessions to Coal and Coke

Moving the wheels of the factories of the United States now requires a total of 51,154,523 h. p., a fivefold gain since the turn of the century. During the past 20 years the power-generating trend has been rapidly from steam engines to steam turbines. At the University of Maryland an investigation into the behavior of boilers is being carried on by railroads, steam-boiler manufacturers, and the U. S. Bureau of Mines. Twenty-six stove manufacturers have joined with Bituminous Coal Research in sponsoring an investigational program at Battelle Memorial Institute. For more than 15 years the American Gas Association has conducted continuous research to provide technical data requisite in developing specifications to conform with advancements in design of appliances and accessories.

The Bureau of Mines is making an investigation of coal preparation in the Alabama fields in collaboration with the University of Alabama and mine operators. Studies covering a large number of Illinois and Indiana coals have developed control of the ash characteristics by the addition of silica or lime. Of about 7,500,000 tons of subbituminous coal mined annually in Colorado, Wyoming, and Montana, approximately 50 per cent probably reaches domestic consumers, and the Bureau of Mines has looked into the utilization of this fuel in home stokers. Through proper maintenance of furnaces and more efficient firing methods home owners and operators of apartment and office buildings could save more than $150,000,000 in fuel bills each year. Proper insulation of dwellings erected during the next 10 years would result in an annual saving of $125,000,000 to the owners.

The Bureau of Mines has described the effect of particle size on the rate of oxidation of anthracite. To obtain activated carbon for water-purification purposes, only high-carbon fractions of bituminous coal refuse, which constitute a small percentage of the waste, have been utilized. Sugar-decolorizing carbons can be made from coal or coal refuse; but the lower the ash of the original raw material, the better the results to be expected. The presence of fusain is beneficial in briquet making, for it reduces the frangibility and smokiness of the product. As to colloidal fuel it is believed that the results of work so far are sufficient to establish its commercial possibilities; it is thought, however, that the search for better and cheaper ways to produce stability should be continued and that much remains to be done on grinding and mixing, atomizing, and burning. Stable suspensions of coal in gas oil or fuel oil can be produced by adding 0.05 to 0.2 per cent of the condensation product of a fatty acid (surface-active type).

In the by-product coke industry the potential annual capacity of all units is 72,073,613 tons. Koppers research on the removal of organic sulfur from coke-oven gas by a new process has been sufficiently successful to warrant the construction of a pilot plant. In another procedure chromium and molybdenum oxide catalysts abstract thiophene from hydrocarbons. Electrolysis can be used for the elimination of the organic matter in the ammoniacal liquors from by-product plants. Aromatic solvents can be made from coke-oven tar by hydrogenation. The extensive research advances in benzenoid chemistry will be discussed in a subsequent section on organic chemical technology. By the Hayes low-temperature process char for use in stokers and briquetted coke for stoves are producible. The Disco product is characterized as smokeless and easily ignitable; Disco tar acids are getting attention. The Bureau of Mines announced that its process of hydrogenation of coals, if applied to the total coal reserves of the country, could yield enough oil to supply the Nation's needs for almost 3,000 years at the present rate of consumption; bituminous coal such as that from the Pittsburgh bed could give an average of 2 tons of oil for each 3 tons of coal mined. Of interest in passing is the fact that sewage-sludge gas has recently been utilized in internal-combustion engines.

New Ceramic Products

Portland Cement. Metalox, which contains powdered iron, is stated to accelerate setting time. Certain synthetic resins are claimed to decrease surface scaling. Cement of high alkali resistance and high

early strength is said to result on addition of sodium sulfate. To increase the sulfate resistance of cements the Al_2O_3 component of the $3CaO.Al_2O_3.6H_2O$ is replaced to form hydrogarnets which contain iron or silica and are stable in such solutions. Verilite is a light-colored cement. Grainlock is a primer or base upon which to apply cement. Sand-cement mixtures are used in place of neat cement for casing jobs and especially for making plugs in side-tracking and hole-straightening operations.

Concrete. Fly-ash admixed cements have given greater resistance of concrete to freezing and thawing. Thermocrete for quickly erectable houses contains volcanic aggregate. Careystone and Panelbestos are cement-asbestos boards. Research is going forward on the use of vermiculite for light-weight concrete. Animal fats increase the shrinkage of concrete, but no similar effect has been noted with resins or mineral oil; resins are more effective in increasing durability than mineral oils. Vinsol resin is reported to reduce scale from freezing and thawing. The warping, cracking, and change of shape that occur in concrete under load are not the result of "plastic flow" but of nonuniform shrinkage. Heat-insulating air spaces are being put in walls by setting short lengths of split green cottonwood logs into wet concrete. Studies are being made of the effects of fine and coarse aggregate characteristics on the durability of concrete and of the adhesion of asphalts. Work is being continued on the physical nature of sand and gravel in different sections of the country.

Concrete Finishing Agents. Congran is a concrete hardener; Primoid and Transeal are waterproofers; Conk is a liquid for protecting concrete floors; Dye-Crete stain and Defensite coating and also Flor-Dye No-Buff are for coloring and dustproofing floors; Granitex is a dust- and oil-proofer; Stone-Kleen is a detergent; Kolor-Gran is a refinisher; Quick-Patch is a ready-mixed material for filling holes. Sy's Plug, a fiber powder, is employed to hold fastenings in concrete.

Other Building Materials. The National Bureau of Standards has reported research on action of frost on bricks, cause and correction of leaky masonry walls, and moisture-condensation in building walls. Plastoid rope is a caulking material for use in place of mortar in coping and similar joints; Hydroso, a waterproofing agent for masonry and wood; Aquanil, a waterproofer for ceramic products. A new plaster is prepared by heating gypsum in a magnesium sulfate solution. Petroleum coke is converted into graphite to produce a porous material, similar to unglazed ceramic ware, which may be made impervious by impregnating with a synthetic resin.

Refractories. The dry strength of Kentucky clays is increased, up to 27 per cent, by aging with magnesium phosphate. A high heat-duty, unfired, dry-pressed refractory may be produced from pyrophyllite and ball clay. Firebrick is made from clay and an organic filler which, upon being burnt out, gives controlled pore structure. Basic refractories are manufactured from dolomite. Stoves having glazed tile exteriors and refractory brick linings, well known in Switzerland, may come into American use.

Refractory Products. Chromlo is a chrome-base refractory for furnace linings; Insuline is a refractory in preformed panels for furnaces; Adachrome-Cote is a refractory powder for coating furnace walls; Plicast is a pulverized insulating refractory for service temperatures to 2,200° F. Silica slurry for patching reverberatory furnace roofs is often bonded by bentonite. Pal-lite is an asbestos plate to support ceramic products while being dried.

Vitreous Enamels. Blends of certain American clays have given results comparable to those obtained by the employment of Valendar clay. The micronizer is applied for increasing the fineness of clays for enamel. A pyrophyllite containing approximately 15 per cent sericite is being substituted in vitreous bodies for flint and some of the feldspar. Zirconium opacifiers are being used in place of stannic oxide in enamels and glazes; crazing is claimed to be decreased by Zircopax. Molybdenum compounds utilized with compounds of antimony are said to impart high adherence to enamels. Architex, Neopake, Pyroflex, Pyronamel, Sanifrit, Satynite, Superpake, and Synamel are enamel frits. Pemco Paradox is a low-fire white cover coat; its companion frit is Bonite, a low-fire ground coat. Flushing the melt with nitrogen has been found to remove dissolved hydrogen and to eliminate defects in enameling. Ing-Rich panels for walls are made of porcelain-enameled steel; Por-Ce-Lok is a porcelain-enameled corrugated-steel sheet for roofs and side walls; Toledohio roofing tile is iron finished on both sides with porcelain enamel. Vitroliner enameled chimney pipe has Fyrex insulation.

PITTSBURGH-CORNING CORP.

The new PC Vue Block, showing the extent of vision possible

Porcelains. Cyanite is being calcined to mullite. As topaz is readily converted to mullite at moderate temperatures, and has a low thermal expansion, it may serve the same purpose as andalusite and dumortierite in electric porcelain, particularly in spark-plug bodies. Several companies are making spark plugs by using ceramic cores containing no mica. Radiant heat lamps have speeded up glazing of electrical insulators 20 per cent. Westinghouse Prestite is a porcelain having high mechanical and dielectric strength. The production of glazed porcelain cooking ware is under study.

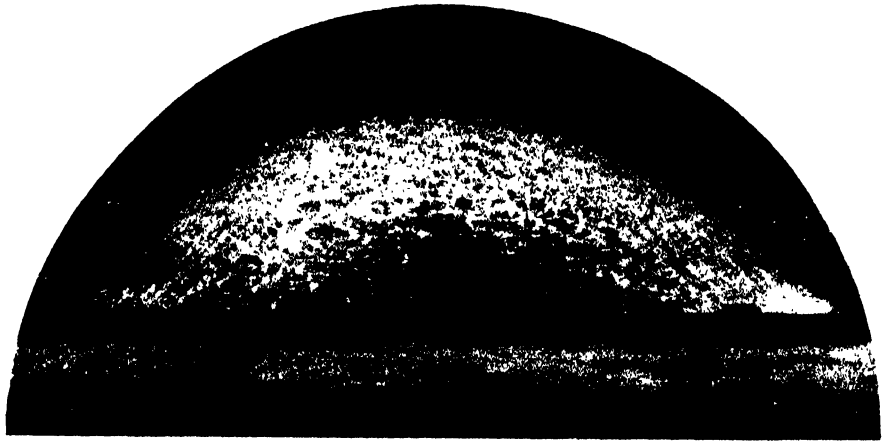
Glass. By a new procedure the components of a vitric batch are precipitated together. Under control sulfates are of aid in the fining of glass. Babosil is a fluxing material to introduce boric acid, alumina, and barium oxide The formation of apatite crystals is responsible for opacity in bone-ash opal glasses. Am-

monia, electrolytically introduced into soda glasses, is easily removable, leaving a glass of higher silica content. Between 500° and 580° reaction takes place between hydrogen and Pyrex. Chlorides of aluminum, vanadium, cobalt, nickel, manganese, and silicon improve the durability of glass. The glass industry may become a large market for zircon, now utilized in heat-resisting glass. Electric welding has been applied in the manufacture and repair of glass articles. Ultraviolet radiation is being used for the sanitization of bottles.

Glass Products. Pittsburgh-Corning introduced glass blocks with open ends for use as flower pots and aquariums; Vue glass block permits vision of large objects beyond the panel. A ground and polished plate glass $^{3}/_{64}$ to $^{1}/_{16}$ inch in thickness is for thin laminated products and mirrors. Silvered-glass reflectors are replacing polished aluminum in street lamps. In Flexseal, made of plastic sandwiched between two lights of glass, the plastic extends beyond the edges as a rim which can be attached to a window frame. Glass-recording disks are utilized in transcriptions for radio broadcasting. Micalex, a mixture of ground mica and glass, is available in injection-molded products. Pittglas is a hot-water-storage tank of steel coated with glass. Alubro-Weld is a blue glass for welding helmets.

Optical Glass. AFC-44 is a fog-proofing material for lenses. RCA antireflection glass is treated faintly with hydrofluoric acid. The coating of exposed optical parts of spectrographs with nonreflecting films of magnesium fluoride and of other parts with films of lithium fluoride has resulted in a doubling of the over-all light transmission. General Electric antisabotage light for protective fence lighting has a special heat-resisting lens. Neodymium is used in neophane glass for windshields and sunglasses and in glasses that are claimed to have the property of correcting incomplete color blindness. Praseodymium is employed in telescope screens. Eastman Kodak announced an optical glass made of tantalum, tungsten, and lanthanum, possessing greater light-bending power than ordinary glass.

Glass Fiber. Fiberglas is being applied in the hull insulation of battleships, in insulating oil tanks in bombers, and in sound-deadening in plant construction. Fiberglas and steel, in layers, are employed in roofs and walls. Tarpaulins made of glass fiber are lighter than canvas; glass fiber awnings are strong, easily cleaned, and decay-proof. Glass fiber curtains, tablecloths, and neckties have also been introduced. Nickel-clad steel tank cars insulated with glass fiber are in use for chemicals. Glass-fiber adhesive tape with a pressure-sensitive coating is another recent creation. Various combinations of glass fibers with plastics have been described for thermal and sound insulation. Fiberglas cloth impregnated with heat-resisting varnish is used as electric insulation; glass-covered wire is now shock-resistant.



PITTSBURGH PLATE GLASS CO.

A light of Flexseal laminated glass developed for airplane windows.

Gains in Metallurgy

The National Bureau of Standards released the findings in exhaustive tests to determine the corrosion behavior of metals in soils and in other environments in which the same corrosive factors are present.

The powdered metal parts in the 1942 cars add up to only 3 pounds, but automotive engineers think that before long there will be 100 pounds in almost every model. Meantime, subsidiaries of both Chrysler and General Motors are supplying other manufacturers with powdered metal gears, bearings, and parts for airplane engines, guns, ships, and household equipment. Powder metallurgical processes lend themselves well to the production of alloys. Metal hydrides have been applied successfully in the reduction of refractory metal oxides. Substitution of 2 per cent of the iron by titanium hydride gave satisfactory results in avoiding aluminum oxide inclusions in the sintering of 10/25/65 Al-Ni-Fe magnetic alloys from powdered mixtures of the metals. Most intriguing prospective use for powdered metals is in clerical machines, where porous typefaces may soak up ink and stamp it on paper. All told, some 5,000 tons of metallic powders have been used in metallurgy this year—up 25 per cent over 1940, 100 per cent over 1936. Precautions must be exercised in preventing ignition wherever metallic powders are produced or used. Special waxes are employed for releasing sintered bearings from their molds. Porex powdered metal products can be processed into almost any shape and degree of porosity up to 50 per cent voids. Several companies have announced the production of powdered iron; one firm is making powder from iron carbonyl.

PITTSBURGH PLATE GLASS CO.

Flexseal withstands 2 tons of air pressure. The glass cracked but the vinal plastic maintained the airtight seal.

The Ferrous Realm

Iron. If air blasted into all 231 furnaces were cleaned and dehumidified, production might be boosted 10 per cent. Concentration of phosphorus on the surfaces of little air-pockets or blow-holes has been proved by radioactive tracers. New methods of dephosphorization are being applied; external desulfurization of pig iron is attracting attention. There are very limited applications of iron plating today. On the other hand, electroforming with iron and electrowinning of iron have recently met with renewed interest. Thirty-two metals have been electrodeposited from aqueous solution, but only about 15 metals are electrodeposited commercially.

Four gray-iron and malleable-iron casting manufacturers are spending in research and development 1.09 per cent of their total operating costs. Malleable cast iron made from metal initially high in hydrogen is inferior in tensile properties to metal lower in hydrogen, even though the final hydrogen content is similar. Super-Y is an alloy between malleable iron and steel. Globeloy is a cast-iron alloy containing silicon and chromium. There is a series of

Left. Unrolling white glass wool which blankets roofs and walls at bomber assembly plants being built for the Army by The Austin Co.

Below. Fiberglas curtains in the restaurant of the new Washington, D. C., National Airport

OWENS-CORNING FIBERGLAS CORP

iron-nickel-chromium alloys suitable for vacuum-tight glass-to-metal seals. A possible substitute for steel to resist deformation at 1,100° F. is iron containing molybdenum or columbium. Molybdenum silicide is an alloying agent for use in gray-iron castings. An experimental road in Minnesota is made of cast iron.

Steel. The steel capacity of the United States has increased almost 40 per cent since 1918 and fully 15 per cent since 1929. The recent advance in knowledge concerning protective furnace atmospheres has been great; continuous casting of steel is increasing; open-hearth operation is now better controlled than formerly. The American Institute of Mining and Metallurgical Engineers published a list of problems relating to the physical chemistry of steelmaking. A catalog of 1,500 tool steels was issued. One of the bigger planes, such as a transport or heavy bomber, requires at least 5 tons of high-grade alloy steels; steel accounts for almost half the weight of both the fuselage and engine. A new process for making light armor plate speedily enables the carrying out of three heats in 24 hours; the carburizing treatment is accomplished with a liquid salt bath in an electric furnace. An automatic machine shapes metal tubing to practically any contour that can be made from solid stock on a lathe.

According to Westinghouse, a $2,000,000 research program resulted in the development of Hipersil, an improved magnetic material for transformer cores which has one third greater flux-carrying capacity than the best conventional silicon steel. Chromium and phosphorus reduce the rate of corrosion of copper-silicon steels. Nickel-copper steels consistently demon-

A view in the turret lathe assembly department at the Warner & Swasey Co.'s new plant in Cleveland

Freshly baked welding rods proceeding from the oven to the inspection table in the plant of The McKay Co., York, Penna.

strate superiority over copper steel in sulfurous atmospheres and show a high degree of resistance in marine atmospheres. More than 75 per cent of cutting tools are tungsten high-speed steel. Molybdenum can be substituted in part for tungsten. Chrom-X makes possible the manufacture of high chromium steels in larger tonnages in open-hearth furnaces. Straight chromium steels have a tendency toward temper embrittlement that can be eliminated by addition of molybdenum. About 0.5 per cent of columbium removes the air-hardening characteristics of 4-6 chromium steels. Bismuth in small amount benefits the machinability of stainless steel. Chromium-nickel stainless steel is nonmagnetic. Molybdenum is finding growing application in S. A. E. steels, frequently as a partial substitute for nickel. Makers of high-pressure valves are utilizing large quantities of molybdenum steels. Ludlite wainscoting is Allegheny stainless steel on a backing of wallboard.

Ferric sulfate is being used in increasing quantities for pickling stainless steel. A new polishing rouge is based on alumina. Parts made of stainless steel can be surface-hardened by the Drever-Industrial process, claimed to form a tightly adhering, abrasion-resistant case; Super-Scottsonizing is a procedure for surface hardening 18-8 stainless steel. Metallurgical engineers have been fortunate in the variety and utility of hard materials and surface-hardening methods that have become available in recent years. Hard-surfacing metals of the Stellite type, nitrided steels, cemented carbides and borides, flame-hardening, hard chromium-plating, and induction-hardening of outer surfaces are among the best known of these recently developed aids to better design and manufacturing practice. A new addition to this field is the process for induction-hardening the internal surfaces of cylinders, tubes, and pipes. High-frequency induction heating is said to be satisfactory for localized surface hardening of crankshafts and a wide variety of machine parts. The use of urea in hardening the surface of steel has been investigated. Endogas for hardening steel is produced from air and a hydrocarbon fuel. Tantung G is a combination of tungsten and tantalum carbides in a matrix of cobalt and chromium available in standard tool bits. Attention has been given to the recovery of values from waste liquors of chromium plating.

The University of Illinois published results of an investigation on welded joints in structural steel plates. A high-speed electrical welding process results in spot welds at the rate of one a second. Strikeasy is an arc welder for bright-surfaced, thin-gage metals. Alternex is an electrode for manual arc welding; Harnimoly is a welding electrode for use on high-carbon and alloy steels that are to be hardened after completion of welding; Weldoloy includes a number of alloys in rod form for application with an acetylene torch. Spatter-Nox is claimed to reduce adhesion of weld-rod spatter to work pieces.

Physical deaeration of water by natural gas decreases corrosion of steel in contact with it. Metlseel is a coating for protecting metal parts exposed to gaseous atmospheres at heat-treating furnace temperatures. The rust-preventive Tectyl consists of lanolin with dispersing and inhibiting agents in a hydrocarbon solvent. TRamscote is a corrosion-proofing liquid for finished metal surfaces. Marlox is a plastic coating for protection against corrosion. Stanwaco is a protective application for steel water tanks. A process has been developed which results in a thin phosphate coating that will not flake away from steel on forming. Corrosil is a rust-proofing agent, converting the surface of the treated iron into phosphate. Monsanto has initiated research on the application of phosphoric acid or phosphate treatment to rolled steel strip for use in cans to evolve a process to make the employment of tin unnecessary. Irco is a zinc phosphate coating for rustproofing metals. Parco Lubrizing is a process to change the surface of steel or cast iron to a phosphate coating which absorbs and retains oil. Electro-Ebonol is for the blackening of steel, stainless steel, and other metals. Airplane engine builders are adopting a new automatic metallizing machine for spraying metals on engine cylinders.

Electroplated coatings on steel may prove valuable and economical by permitting substitution of plated steel for metals needed for other purposes. Copper-plated steel shell casings are being made. Electroplated coatings of zinc and tin can replace thicker coatings produced by hot dipping. Dross formation in hot-dip galvanizing is reduced by zinc ammonium chloride predips. Heat-treated zinc coatings on sheets and wire consist in the alloy layers mainly of $FeZn_{13}$. The Galv-Weld process renders unnecessary hot dipping in joining galvanized materials by welding. A new method of electroplating steel with zinc uses cheap sources of zinc instead of zinc anodes. Paint-bond galvanized steel sheets are said to assure effective adhesion of paint finishes. Zinc-grip-Paintgrip steel sheet has a combined Bonderized finish and zinc coating. Dymaxion is a prefabricated galvanized steel roundhouse for defense housing. Two steel companies are manufacturing tin plate by electrolytic methods wherein the thickness of tin per unit of surface is reduced below the figure possible by hot-dip methods. One of these products is finished by a brushing operation, which yields a semibright or so-called Butler finish, whereas the other has a mirror-bright surface obtained by heating the tin-coated strip under oil. Oxygen induces passivity while nitrogen increases the corrosion rate of tin. Amco metallic coating powder is intended for repairing damaged tin platings. Research is being pursued on the improvement of solder fluxes. Microplastic is a coating for plating racks.

The Province of Nonferrous Metals

Copper. To combat static electricity, copper powder is being put in flooring cements (Hubbellite) and rubber belting. The National Bureau of Standards has indicated how the texture in severely cold-rolled copper is developed. Rocan is a roofing copper. Tempobrazing is for hard-soldering cold-worked copper and copper alloys. Stearamide is used as a flux for copper. A recent development of the ethylene diamine bath has resulted in the production of copper-lead plates that are adherent to a properly treated basis

metal. Upon adding ammonium sulfate to copper amine baths bright ductile plates are obtained on electrodeposition.

Copper Alloys. Vankolite is a beryllium-copper alloy for bits; an alloy containing 2 to 2.5 per cent beryllium is used as a substitute for gold. Bon White is an immersion-type tin finish for copper and brass. Ferric sulfate is being employed in finishing brass cartridge cases. Dezincification of α-brass alloys may be suppressed by a small addition of arsenic, antimony, or phosphorus. Carbobronze is a bearing material containing 9.12 per cent copper, 8.5 per cent tin, and 0.3 per cent phosphorus. Monarch Metal is a high-lead-bearing bronze. Ledaloyl is a self-lubricating bronze carrying lead, graphite, and oil; Selflube porous bronze bearings employ powdered metal to provide a structure about 35 per cent porous. Velvetouch is a friction material consisting of powdered metals such as copper, tin, or lead, compressed, sintered, and welded to a solid metal backing. Ceko is a bronze-base repair alloy. Silicon-modified bronze can be welded to steel.

Lead. In recent years the smelting rate of blast furnaces has been increased. Norm Leadmetal is a powdered lead sealing material. Leadleaf or Metalead is a leafed metallic lead paste for use as a pigment alone or with aluminum. Roofloy is a sheet lead roofing containing small amounts of calcium, magnesium, and tin. Metro-Seal glazing tape consists of a plastic sealing compound attached to flexible lead foil strip. Tetragonal lead monoxide may be applied electrolytically to lead for protection against abrasion. A new lead-base bearing alloy contains antimony 12.5, arsenic 3, and tin 0.75 per cent. Stronger pewterware can be made from new alloys.

Zinc. Zinc, tin, and lead powders are being marketed for repairing surfaces of these metals. In cyanide zinc baths several bright plate processes have been introduced that give deposits ranging from a bright luster to a brilliant surface resembling chromium. Ebonol Z is an immersion process for the blackening of zinc and its alloys. A method has been developed for the recovery of indium from old plating solutions, but the supply of the metal is said to be adequate.

Silver. Anaconda, Phelps Dodge, and Cerro de Pasco have been seeking new industrial uses for silver. Some of their suggestions: substituting silver for copper in electrical contacts and using silver with magnesium for light-weight alloys. Automobile manufacturers are looking into silver plate as a substitute for chromium and nickel over copper. The National Academy of Sciences has proposed that silver be put to work for tin in solder. Silver has been found superior to copper as a catalyst for vapor-phase oxidations. The applications of silver and silver alloys in the new General Electric steam locomotive include plating for headlights, contacts on electric circuits, and high-ductility brazing alloys to join copper parts to steel and brass. In electric motors and generators the alloy Sil-Fos, composed of silver 15, copper 80, and phosphorus 5 per cent, is used to attach copper leads to the copper brush-holder collector rings. Storage batteries with heat-treated 4 per cent antimony–0.10 per cent silver alloy grids have proved excellent. The fungicidal properties of silver have been studied.

Aluminum. Work progressed on aluminum welding processes. Wear Ever is a slip-proof material made of carborundum grains fused into an aluminum backing. A sensitized photographic sheet comprises aluminum with an emulsion coating. It is predicted aluminum may later be used extensively in photographic and motion-picture films. The automobile industry is planning to jump into the employment of aluminum in a big way after the emergency terminates. With improved techniques a better insight is being had of the formation, structure, and properties of anodic coatings. Aluminum-beryllium alloys are being studied for suitability in pistons. The use of more manganese-aluminum alloy has been urged in place of pure aluminum for greater strength and thinner gages. Aluminum-magnesium-manganese alloys known as Navalium have good mechanical properties and resistance to corrosion. Indium has a marked influence on age-hardenable aluminum alloys. Innumerable du Pont explosive rivets of anodized aluminum alloy have been used in aircraft construction. Heat applied to the rivet head by an electric gun detonates the explosive in a cavity at the end of the shank, expanding the latter and forming a blind head in setting the rivet.

Magnesium. From $1.80 per pound in 1918, research has lowered the magnesium price close to 20 cents a pound. Dow put out 30,000,000 pounds of the metal in 1941. Sea water is used as the source of magnesium in plants in Louisiana and Texas. Production of magnesium from magnesite by an electrothermic reduction and distillation process passed the unit-plant stage. The basic idea of another process is to reduce magnesium oxide with carbon, dilute and cool the reaction products with a cold inert gas. Magnesium-thermit bombs are quite efficacious in warfare. Calcium, cerium, gallium, and thorium increase the ductility and strength of magnesium. By proper selection, surface treatment, and painting, it has been found possible to obtain satisfactory protection on magnesium alloys for several years. Wright, Ranger, and Allison airplane motors and wheels for Army bombers are made from magnesium alloy castings.

Nickel. Nickel plating is one of the most important activities in the electrodeposition field. Future developments are seen in still better corrosion protection, in perfected bright nickel, and in heavy nickel-plate adequately pliable and ductile that the plated article will withstand the same strains and stresses of fabrication to which the basis metal is submitted. KR Monel is an alloy in rod form, said to be corrosion-resistant, heat-treatable, and nonmagnetic. Zirconium is reported an efficient degasifying agent for nickel-silicon bronzes. Zirconium powder, by the way, is spoken of highly as an ammunition primer. Beryllium-nickel alloy is produced by a powder metallurgical method.

BELL TELEPHONE LABORATORIES

A study of environmental factors in the corrosion of lead cable sheath

Neutralloy is a machinable alloy with a base of 74 per cent nickel and 14 per cent chromium. Cobalt-nickel alloy plate is whiter, harder, and more corrosion-resistant than either cobalt or nickel plate. Vitallium, an alloy of cobalt, chromium, and molybdenum, first proposed for dental use, is being employed in skull repair. Cobalt is being produced at a new Union Carbide & Carbon plant in Niagara Falls.

OEM DEFENSE PHOTO BY PALMER

Inspection of a magnesium casting, a crank case blower for an aircraft engine, Ford River Rouge plant

Some Accomplishments in the Inorganic Chemical Field

Cobaltous oxide is reported effective in removing the oxygen impurity in tank nitrogen. Ozone free of oxides of nitrogen is said to be nontoxic in concentrations below 20 parts per 1,000,000. Chlorine gas in air is less germicidal than hypochlorous acid. The annual production of chlorine has reached 500,000 tons; its manufacture consumes over 2,000,000,000 kw.-hr. per year. Some of its newest uses are in the synthetic rubber industry. Dactin is an active chlorine compound for bleaching and sterilizing; Perchloron, high-test calcium hypochlorite, is another entrant in the sanitation field. The completion of several large and many small waste-treatment plants indicates the general progress made toward cleaner streams and less health hazards. No fundamentally new processes have appeared, but tendencies are toward more mechanization and broader use of physical methods. By-product utilization has been taken up aggressively. Ferric chloride is used successfully as the coagulant in several recent installations; Ferrigel is a preparation of ferric chloride, glue, and certain proteins. Another coagulant, sulfacar ($Al_2Cl_2SO_4(OH)_2$), has shown slightly better results than standard alum.

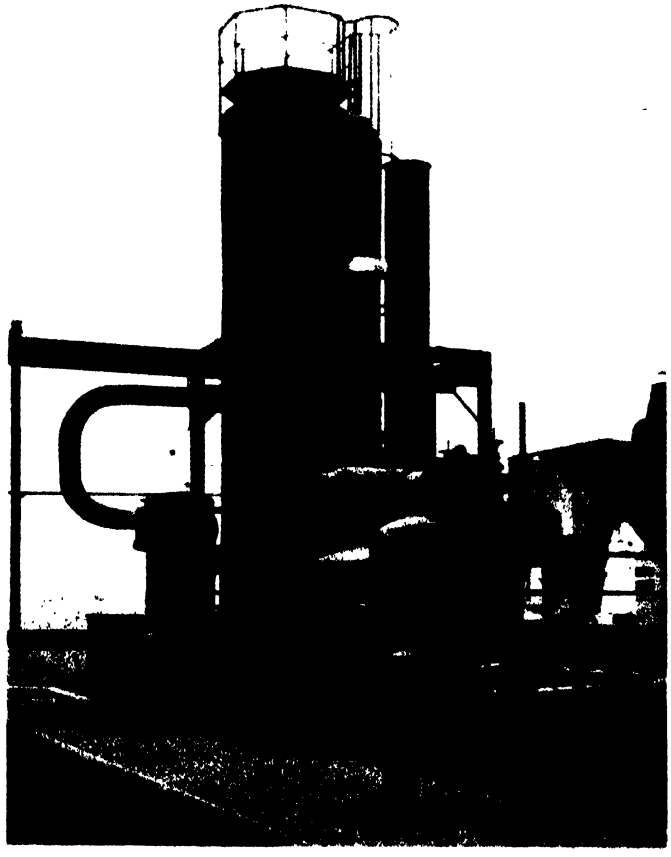
An addition to the family of hydroxylammonium salts is the chloride. At 935° a lithium chloride recovery greater than 95 per cent is obtained by passing hydrogen chloride over lepidolite. The reactions of metal oxides with sodium chloride, sulfur dioxide, air, and steam have been suggested as possible outlets for large quantities of sulfur dioxide that may be recovered from waste gases. The employment of such cheap and abundant raw materials for the production of salt cake, hydrogen chloride, chlorine, and anhydrous metal chlorides and sulfates is of future interest to the heavy chemical industry. Anhydrous reaction of sulfur trioxide on sodium chloride offers a possible means of making sodium sulfate and chlorine simultaneously. At Monahans, Tex., Ozark Chemical is recovering sodium sulfate by artificial refrigeration of a natural brine occurring underground; submerged combustion is applied to produce anhydrous sodium sulfate. Sodium sulfate-bearing brines have been discovered in southeastern New Mexico. Rem-Ox is anhydrous sodium sulfite for use in oxygen removal in boiler-plant operation. There is room for research on ammonium sulfamate as a herbicide to determine the best methods of application to specific weeds under particular local conditions. Liquid sulfur dioxide is an excellent solvent medium in conducting reactions involving the use of catalysts of the aluminum chloride type and in polymerizations. Aitch-tuess is a preparation for producing hydrogen sulfide. Fog over aerodromes can be dispersed with sulfur chloride solutions.

The production of potassium chloride has been increased. Union Potash & Chemical is making potassium sulfate from langbeinite ore. Potassium chlorate manufacture was started by Western Electrochemical. Companies near San Francisco are producing magnesium oxide for fertilizers from sea water. The use of magnesium oxide has been investigated in silica removal in conjunction with hot-process external phosphate softening. Quadrafos is Rumford sodium tetraphosphate. Methods are being developed for the production of metaphosphates of the alkali metals from their chlorides. V-90 is a coated anhydrous monocalcium phosphate. Tricalcium phosphate is being employed to free water of fluorides. A process for making phosphoric acid containing about 85 per cent phosphorus pentoxide ("superphosphoric acid") involves the absorption of phosphorus pentoxide vapor. Monsanto now has the largest elemental phosphorus plant in the world. The addition of from 2 to 10 per cent of phosphorus to propellants is claimed to eliminate gun-barrel corrosion and pitting. Many unusual phosphorus compounds are ready for application, such as the thiophosphonic acids and their derivatives. The total available phosphates are placed at more than 13,500,000,000 tons.

Activated alumina was introduced as a desiccant and catalyst. Zinc oxide, made by flash calcination of zinc sulfite, has been proposed as a heat-insulating material. Anhydrous zinc chloride has been found to be very soluble in furfural. Anhydrous sodium molybdate is being made on a commercial scale. Rhenium-bearing molybdenite occurs in northern Wisconsin. Europium compounds have been nominated for use in fluorescing tubes; erbium compounds have been mentioned as medicinal astringents. Mesothorium is preferred to radium in airplane dial paints.

Novel Methods and Materials in Organic Chemical Technology

Of so much scope has been the industrially significant synthetic research in the organic field it is very difficult, although worth the effort, to distill its essence into a succinct summary. Many organic reactions that, by older methods, require high temperatures or pressures are carried through at ordinary temperatures and pressures by electrolysis. The effect of metallic halides on the reaction of Grignard reagents and organic molecules containing functional groups is being studied. A procedure has been developed for condensing alkyl carbonates with organic esters by metal alcoholates for the convenient production of malonic esters. The use of a third component to improve the fractional distillation of binary liquid mixtures has attracted experimental interest. Resinous products derived from substituted silicon compounds have been de-



scribed. The organic chemistry of titanium offers an excellent field for research.

Alcohols, Acids, and Esters. Nitrogen dioxide and nitric acid yield the same nitroparaffins. 1,1-Dichloro-1-nitroethane is an insect fumigant. Esters of the nitroalcohols, formed by condensation of nitroparaffins with aldehydes, provide a series of solvents. Four new vinyl alcohols have been prepared. Applications have been uncovered for ethyl chlorocarbonate. There is offered stabilized chloroacetone which can be stored for months without change. Chlorinolysis of dichloropropanes is a proposed method of converting these relatively unstable compounds into more useful carbon tetrachloride, hexachloroethane, and tetrachloroethylene. Dichloroethyl formal is suggested as a high-boiling solvent for oils, fats, and resins. New methods of manufacture of propiolic acid from acetylene have stimulated attention to the potential industrial uses of this reactive compound. Hexyl ether has good antifoam properties. Secondary olefins react with acids in the presence of hydrogen fluoride to give good yields of esters. There is some evidence that long-chain organic acids and unsaturated hydrocarbons are formed during the bacterial decomposition of hydrocarbon fractions. Continued research has resulted in increased employment of the azeotropic distillation method of separating water from acetic acid. *o*-Chlorophenoxy-acetic acid and *p*-chlorophenoxy-acetic acid are Dow products. Chloroacetonitrile reacts with aromatic compounds to give aryl derivatives of acetic acid. Acetamidine can be condensed with a properly substituted ester to give the pyrimidine half of vitamin B_1. Citrazinic acid is a source of dyes. Data have been presented on 36 out of a great number of possible esters of sodium sulfosuccinic acid. Wastes from butanol-acetone fermentation are amenable to treatment by anaerobic digestion; substantial quantities of gas, suitable for engine fuel, are produced. Diisobutyl adipate and also dicyclohexyl adipate are available in semicommercial quantities. Fumaric acid has prospects in synthetic resin technology.

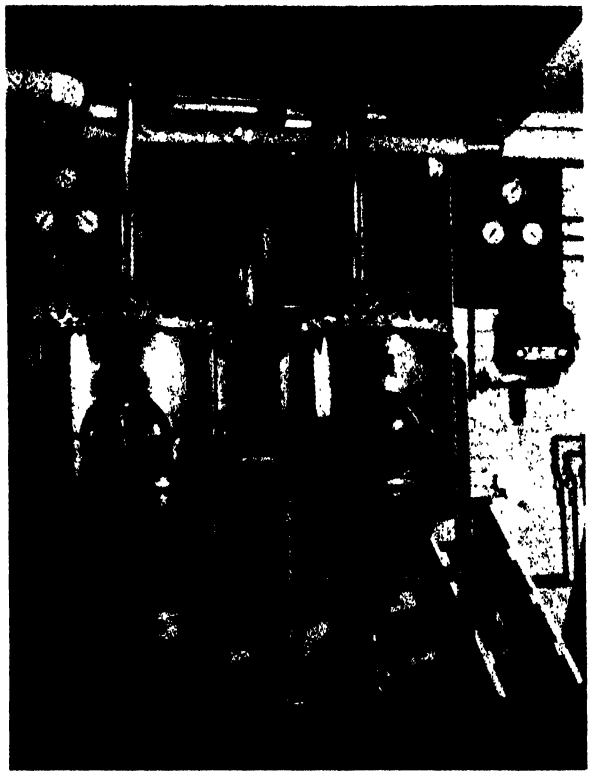
Synthetic Glycerol. Dichloro-*tert*-butyl alcohol, the principal product from the chlorohydrination of methallyl chloride, has been employed for the synthesis of B-methylepichlorohydrin, B-methylglycerol monochlorohydrin, B-methylglycidol, and B-methylglycerol. A similar but more complex series of compounds has been prepared from trichloro-*tert*-butyl alcohol. Synthetic glycerol, produced by hydrogenolytic processes, is impure and the isolation of C. P. grade has proved difficult. A new approach to the problem—namely, crystallization in the presence of suitable solvents—yields glycerol of purity. It is now possible by treatment with hydrogen to produce glycerol from such abundant carbohydrate materials as starch and dextrose. Shell's synthetic glycerol process has brought a number of intermediates and derivatives formerly obtainable in quantity only from glycerol itself. In the catalytic process of Battelle Memorial Institute glycerol is produced from petroleum refinery gases without high-temperature chlorination. Glycerol formal is being used as a solvent for zein as well as cellulose esters.

Fats and Fatty Acids. The annual production of deodorized fats is not less than 1,500,000,000 pounds; the neo-fat production provides an additional 30,000,000 pounds. Compounds typified by stearamide and stearonitrile are finding industrial applications, apart from being intermediates for other technical products such as higher alkyl amines and amidines. Releases on a laboratory scale of the following new chemicals were announced: lauric ethanolamide, mannitol glyceryl hydroxystearate, nonaethylene glycol monolaurate, nonaethylene glycol dilaurate, pentaerythritol monostearate, pentaerythritol distearate, pentaerythritol tetrastearate, polyglyceryl stearate, polyglyceryl hydroxystearate, and propylene glycol monostearate. Stearyl chloride is being marketed. Stearite is a stearic acid produced by selective hydrogenation. Lauric acid of low titration strength, synthetically made, is known as Lauralone. Mixed sterol glucosides have been isolated from cottonseed oil. Ascorbic acid is an effective antioxidant for certain vegetable oils, their hydrogenated products, and esters; it enhances the antioxygenic activity of tocopherols, hydroxychromans, and hydroquinones. Cottonseed-oil industrial soap is getting trial in place of olive-oil-base products. From the investigation of the saponification of fats at high temperatures in the presence of kerosene several operating difficulties in the process have been overcome. As little as 3 to 5 per cent of bentonite improves the properties of soap, but this quantity does not effect much of a saving in fat-acid content. Soaps from pyroabietic acid are more germicidal than soaps made from gum rosins, as are also soaps of tetrahydro-, dihydro-, and freshly prepared abietic acids.

Grapeseed oil is employed in cosmetic creams; sulfated hydrogenated castor oil is being used as a water-soluble ointment base. Five nitroparaffin derivatives, whose higher fatty acid soaps make up a group of emulsifying agents, are finding industrial applications. Methylmorpholine is potentially useful in preparing emulsifying agents for polishes. "Self-polishing" floor waxes of water-resistance are being manufactured with 2-amino-2-methyl-1-propanol; cosmetic creams and lotions are utilizing 2-amino-2-methyl-1,3-propanediol as the emulsifying agent. New perfume fixatives are derived from the skunk and muskrat.

ARMOUR & CO.

Refractionating tower used in neo-fat manufacture



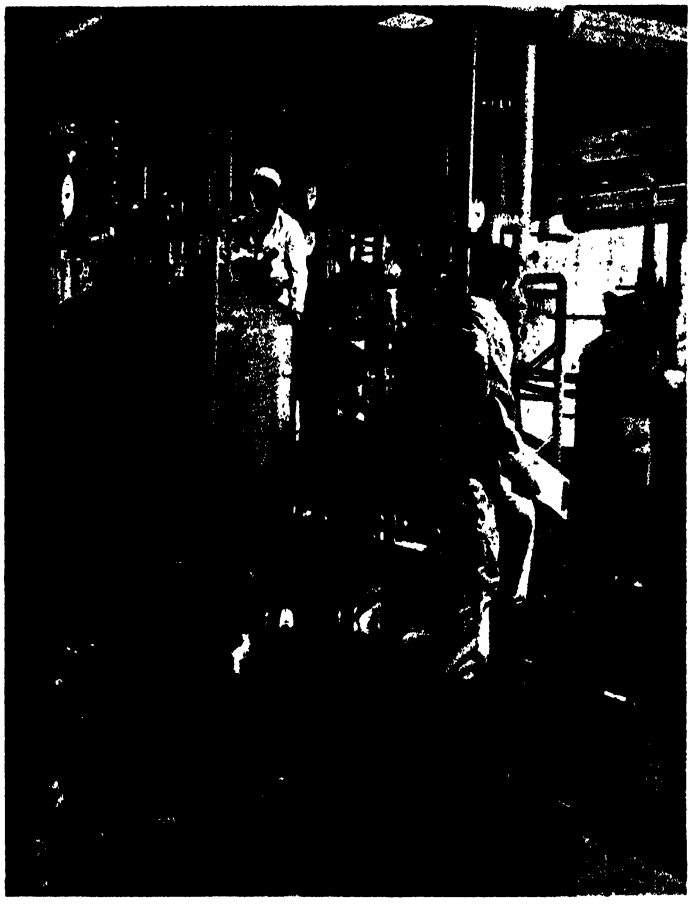
Amines and Their Kin. Amine gas-purification systems are being used to remove hydrogen sulfide or carbon dioxide from gas streams. Amination in liquid ammonia is seen as a method of importance for the preparation of primary alkyl amines. The commercial availability of monoethanolamine has led to studies of its action on plant tissues; the effect of other

commercially available organic nitrogen bases on cornstalk lignin has been investigated. Isopropylamine is offered in commercial quantities. A new synthesis of chloroalkyldialkylamines consists of treating a chloroiodoalkane with diethylamine; by reductive debenzylation of benzyldialkylamines, pure dialkylamines may be obtained readily. Monsanto is manufacturing 14 amines that are finding uses in the production of dyestuffs. Dioctylamine, a compound prepared from caprylic acid, is an insecticide. Formerly imported amino acids and peptides are being prepared at the University of California. Schwarz is manufacturing nucleic acid, its salts, glutathione, and Polidase, an enzyme.

Carbohydrates. Following the development of a method of using molds to ferment glucose into gluconic acid, federal chemists have learned that the addition of a boron compound promotes the process. At the National Bureau of Standards an investigation has been undertaken on the reactions of chlorites with carbohydrate materials. Sixteen new propionates of sugars have been synthesized. Staley is erecting a levulinic acid plant. Arlex is Atlas commercial sorbitol solution. Certain heavy metal pectates are water repellent. A San Diego producer of agar agar tripled its output of 20,000 pounds a year. Mucilages of sodium alginate can be used in pharmacy. Gelloid is a binder made from carrageen.

Some Benzenoid Chemicals. Several new phenol plants are being built. Synthesis of phenol by a method involving the partial-pressure evaporation of water of reaction as formed is said to offer advantages over customary processes. Many of the phenols can be commercially synthesized, a few of them at lower cost than the present substituted phenols. Diphenyl carbonate has been introduced as a plasticizing agent. *o*-Amylphenol is an antiskinning agent for varnishes. In commerce are phenol sulfonic acid, naphthalene sodium trisulfonate, benzene monosulfonic acid, benzene metadisulfonic acid, and catechol sulfonic acid. Butyl catechol is also on the market. Ethylpolychlorobenzene is suggested as a solvent in inks and coatings. Sodium pentachlorophenate is applied in preventing and destroying algal growth and as a mycostatic agent. Monsanto products helping to replace intermediates no longer procurable from abroad are *o*-chloroaniline, *m*-chloroaniline, *p*-chloroaniline, *p*-anisidine, *o*-nitroanisole, benzyl chloride, and *o*-aminodiphenyl. The chemical configurations of *o*-nitrodiphenyl and its reduction product, *o*-aminodiphenyl, indicate a number of possible uses in the synthesis of dyestuffs, insecticides, and plastic compositions. Santophen 7 is a mixture of *o*- and *p*-benzylphenols. Commercial availability of 2,3-hydroxy-methoxy-benzaldehyde has also been announced by Monsanto. Two new preparations, of interest as chemical intermediates, are 2,3-dimethoxy-benzaldehyde (*o*-veratraldehyde) and 2,2′-diamino-diphenyl disulfide, obtainable in experimental quantities.

The production of phenyl diethanolamine has been transformed to plant-scale operation. A catalytic process has been described in which hydroaromatic compounds containing a completely or partially saturated benzene, naphthalene, or phenanthrene nucleus are dehydrogenated to the corresponding aromatic compounds in good yields. *o*-Phenoxybenzoic acid may be used as an intermediate for miscellaneous organic syntheses; its esters may find application in the preparation of pharmaceuticals and in the formulation of resins and plastics. Work is contemplated on the reduction of naphthenic esters to naphthenyl alcohols and on their use in the preparation of high molal salt emulsifiers and detergents. The facile hydrogenation of the pyrroloid ring in indoles and phenylpyrroles is attributed to the decrease in resonance brought about by the benzenoid ring. Carbazoles are much more resistant to catalytic hydrogenation than the indoles and phenylpyrroles. Xanthone (dibenzo-γ-pyrone) is commercially available. Victor chemicals recently developed include phenyl phosphine sulfide and monophenyl phosphinic acid. Koppers is notably active in research in this whole field.



Extraction unit of pilot plant used in recovery of ursolic acid, Cranberry Canners, Inc.

The amyl naphthalenes are plasticizers, vehicles for certain types of inks, coupling agents for mineral and vegetable oils, and media for constant temperature baths; they can be nitrated or sulfonated and the sodium sulfonates of refined mixed amyl naphthalenes are wetting agents. 3-Cyanopyridine is converted to nicotinic acid by hydrolysis. A liquid-phase oxidation of heavy pyridine bases has given rise to pyridine carboxylic acids, useful in producing picolinic acid and nicotinic acid. Reilly Tar & Chemical is making acridine and α-picoline. The intramolecular condensation of *o*-formotoluide is a method for the preparation of indole. Dipicrylamine is said to act as a selective agent to extract potash from sea water.

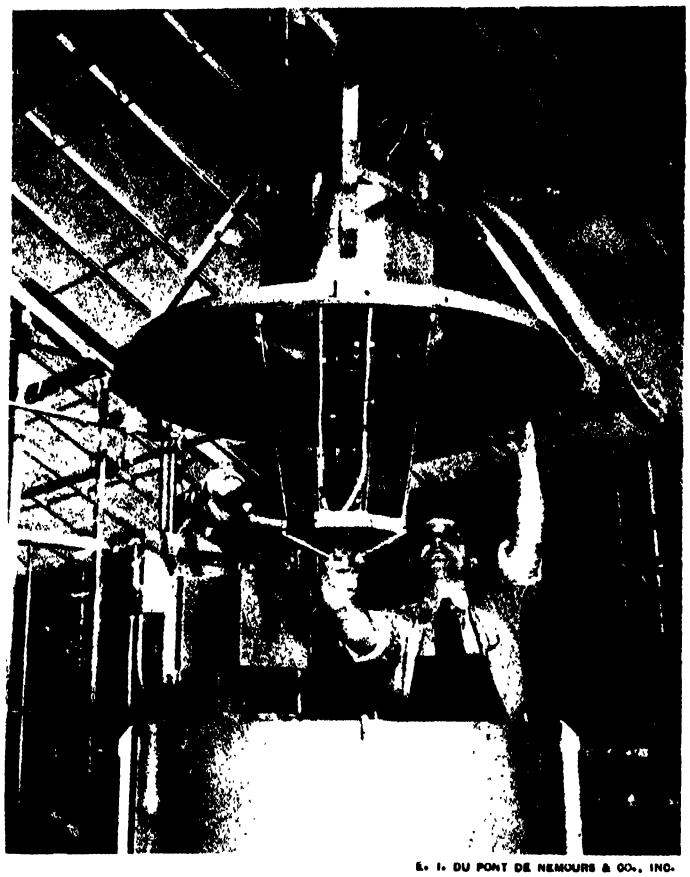
The most effective charges for underwater destruction are no longer trinitrotoluene (trotyl) and picric acid (melinite) or mixtures of trotyl with hexanitrodiphenylamine and tetranitroaniline, but are mixtures of high-brisance pentaerythritol tetranitrate (pentrit) or trimethylenetrinitramine (hexogen) with 30 to 40 per cent trotyl.

New Phytochemicals. At Deepwater Point, the du Pont synthetic camphor plant has a capacity of about 4,500,000 pounds a year. The 6-amino and 6-hydroxy derivatives of dehydroabietic acid have been prepared by Hercules. Flexalyn is diethylene glycol diabietate; Pentalyn G is a member of the pentaerythritol abietate resin family of rosin esters, offering special viscosity characteristics. Hercules Poly-pale resin is derived from rosin through a process for polymerizing the unsaturated resin acids. Retene is being produced at Jacksonville, Fla. At the University of Oklahoma the oil of Mexican sage has been under study. The acidic constituent of the volatile oil of catnip, to which the name nepetalic acid is assigned, is a tri-substituted cyclopentane. Ursolic acid is being produced by Cranberry Canners on a pilot-plant scale; the firm can also manufacture cranberry-seed oil and a hard wax from cranberry skins. The sodium salt of ursolic acid, formerly known as malol and identical with urson and prumol, has emulsifying properties. Sitosterol has been isolated from apple and red-cherry seeds. A wax may be obtained from Arkansas green lint.

Therapeutic Agents. A division of chemotherapy has been formed by the National Institute of Health. The mono-, bromo-, and monochloro-olefins offer possibilities as agents for use in general anes-

New plant for making sulfonamide drugs, Calco Chemical Division, American Cyanamid Co.

thesia. A number of 1-dialkylamino-alkyl-2-alkyl-3-aminophthalates have been found to be strong local anesthetics. Pinacolonylbarbituric acids have lower therapeutic indexes than does amytal. Strong anticonvulsant activity is exhibited by 5-phenethyl-5-phenylhydantoin. Propylene glycol and related glycols act as bactericidal aerosols. A chlorinated dihydroxy-diphenyl-methane derivative is a germicide and fungicide. Furmerane, 2-hydroxymercurifuran, is an antiseptic. Two sulfones, 2-sulfamyl-4,4'-diaminodiphenyl-sulfone and 4-aminophenyl-5'-amino-2'-pyridylsulfone, have been observed to be highly active against experimental streptococcal and pneumococcal infections in mice. Sulfadiazine is the 2-sulfanilamidopyrimidine analog of sulfanilamide; there is also sodium sulfadiazine. 2-Sulfanilamido-4-thiazolones show chemotherapeutic activity; sulfapyrazine, sulfahydantoin, and sulfathiazoline are also therapeutically promising. Solutions of sulfanilamide and related sulfa drugs appear to act like colchicine in speeding up evolutionary changes in plants; colchicine has been used in producing apparently similar changes in animals.



Arseno-Detoxin is said to compare favorably with the arsphenamines. Pure cacodylic acid is being manufactured. Sufficient supplies of belladonna and digitalis can be cultivated in this country to take care of civilian and military requirements, and attention is being accorded to the domestic production of ergot. The U. S. Public Health Service is working to evolve synthetic drugs to replace cinchona alkaloids. The text of the twelfth revision of the United States Pharmacopeia will become official about August 1, 1942. To a greater extent than ever before pharmacopeial recognition is being given to organic synthetics in the field of medicine, as follows: butacaine (butyn), butyl aminobenzoate (butesin), carbarsone, chloroazodine (azochloramide), dihydromorphinone hydrochloride (dilaudid), diphenylhydantoin sodium (dilantin), ergonovine maleate, ergotamine tartrate (gynergen), estradiol benzoate, estrone, eucatropine hydrochloride (euphthalmine), hexylresorcinol, menadione (vitamin K), mercurphylline (mercupurin), mersalyl (salyrgan), neostigmine (prostigmine), nicotinamide, pamaquin (plasmoquin), quinacrine (atabrine), riboflavine, sulfapyridin, sulfathiazol, sulfarsphenamine, sulfobromophthalein sodium (bromsulphalein), tetracaine hydrochloride (pontocaine), tetrachloroethylene, trichloroethylene, and tribromoethanol (avertin).

Harvest Treasures of Agricultural Research

Agriculture knows no pause in advancement. When our Nation was founded 19 people out of every 20 had to devote all their time producing food for themselves and the 20th person; today an individual on the land supports himself, 3 people in town, and contributes to the sustenance of a person overseas. There are about 250,000 known species of plants in the world, of which approximately 15,000 are native to the United States. Photosynthesis has been further elucidated by tracer studies; some phases of the process may be independent of light. The American Society of Agronomy and the National Fertilizer Association published a valuable book on the symptoms of malnutrition in plants. All four regional laboratories of the U. S. Department of Agriculture have been occupied; more than 400 persons are at work in them and the staffs are being enlarged. In the southern regional laboratory cotton, peanuts, and sweet potatoes have been selected for initial study. Chemurgists are hopeful of utilizing more and more agricultural wastes in plastics. An Inter-American Institute of Tropical Agriculture is projected as a combined school and experiment station for all the American republics.

Advances in Phytotherapy. Truck crops and farm seeds are subject to attack by more than 500 different disease organisms. Most wheat diseases can now be controlled or prevented by breeding resistant varieties. Work in plant breeding has protected sugar-cane and sugar-beet areas from threatened ruin. Applications of genetics have saved the winter lettuce industry of California. Cabbage growers have resistant varieties to combat the destructive yellows disease. The large winter-shipping tomato business and much of the tomato-juice canning industry owe their existence largely to the development of improved tomato varieties. Disease-resistant vegetables for the home garden have been described by the U. S. Department of Agriculture. The wilt disease of many plants and the bleeding canker of hardwood trees are being treated by diaminoazobenzene dihydrochloride. Calomel has been found a preventive of crown gall.

All but 10 of the 57 elements that have been found in plants may be regarded as micro or trace elements, and emission spectrography is considered a powerful tool for the investigation of agricultural problems involving them. The number of minor elements necessary for plant growth is not known; they include iron, manganese, boron, zinc, and copper. In certain regions some symptoms of minor element deficiency have been definitely established, such as zinc deficiency in pecans and prunes, and boron deficiency in sugar beets and various truck crops. In many other cases confusion is evident in the attempts to diagnose symptoms. Milorganite has been reported to correct deficiencies of copper, zinc, manganese, boron, and molybdenum in solution cultures of sunflowers and tomatoes. Es-

E. I. DU PONT DE NEMOURS & CO., INC.

This carbon-arc lamp is a near approach to natural sunlight.

Min-El is a mixture of inorganic salts for use with fertilizers.

Fertilizers. About 60,000,000 of the 360,000,000 acres of crops grown annually in the United States now require fertilizing each year, and between 7,000,000 and 9,000,000 tons of commercial fertilizers are consumed annually for this purpose. As a result of the practical application of the findings of research, more than one fourth of the nitrogen used in mixed fertilizers is supplied by ammonia liquors. Superphosphate in granular form is spread in cow barns as an antiseptic material; in combination with the ammonia it binds and with stable manure it forms a fertilizer. The double sulfate of potassium and magnesium is being shipped from Carlsbad, N. Mex., for application to citrus and other crops grown on sandy soils deficient in magnesium. Waste sulfite liquor has been shown to supply sulfur in soils lacking in that element. The use of chemical fertilizers dissolved in water as a starter solution and for liquid side-dressing of vegetable crops has been the subject of much research during the past few years. Liquid fertilizers seem to be well suited for the small garden and have also been employed successfully in greenhouses and by growers who utilize irrigation. The preparation of fertilizers in the form of pellets and cubes is said to prevent losses by dusting, to reduce fixation of phosphorus and potassium in the soil, and to facilitate deep placement in fruit and shade-tree fertilization.

Growth Regulators. Hormodin and Rootone are proprietaries containing root-formation activators. Of like purpose are Root-Gro Vitamin B_1, Tat Vitamin B_1, and Vita-B-One. Plant Dinner, Plantet, Plantabbs, Stimuplant, and 3-6-40 are chemical plant foods, some of which combine vitamin B_1 with other nutrients. Bloomlife and Floralife are employed for prolonging the life of flowers. Experimental work on factors that influence the keepability of cut flowers has been under way at the Ohio State University since 1934. Boric acid has been found useful on carnations; sugar solutions prolong the life of China asters; hydrazine sulfate is applied satisfactorily for roses and carnations. Grofast Cartridges apply vitamin B_1 to gardens and lawns by insertion into sprinkling hose. Magic Green Fingers are pieces of wood impregnated with vitamin B_1 for supplying the latter to plant soil. Naphthalene acetamide has received wide attention as a plant hormone. Parthenocarpic development of tomato fruit is induced if flowers or buds are sprayed with emulsions or solutions of β-naphthoxyacetic acid, which may be utilizable for the practical production of seedless tomatoes and possibly other seedless fruits. Rooting of numerous varieties of citrus cuttings is favored by immersing them in 0.02 per cent heteroauxin or 3-indoleacetic acid solution. This chemical also increases cotton yields. 3-Indolebutyric acid is being used as a growth promoter by pecan husbandmen. Studies of several thousand sugar-cane seedlings developing from colchicine-treated seeds have disclosed that colchicine is capable of changing the cellular and nuclear organization of the cane plant, just as it has been found to be for other agricultural plants. A natural substance that may be extracted from ripening corn pollen can produce effects on growing plants similar to, but stronger than, applications of the chemicals known as growth-regulating substances. An extract of last year's dead leaves will delay the opening of next year's buds on cut fruit-tree twigs set in it.

Cotton and Soybean Technology. The United States is embarking on a farm program designed to result in the production of over 10,000,000,000 pounds of fats and oils during the 1942–43 season. There is need for new work in the field of peanut processing, although research on perfecting peanut flour is in progress; thiamine losses up to 90 per cent occur during processing, but the nicotinic acid content is not appreciably affected. In Alabama the flame-

The du Pont Pest Control Laboratory at Wilmington, Del.

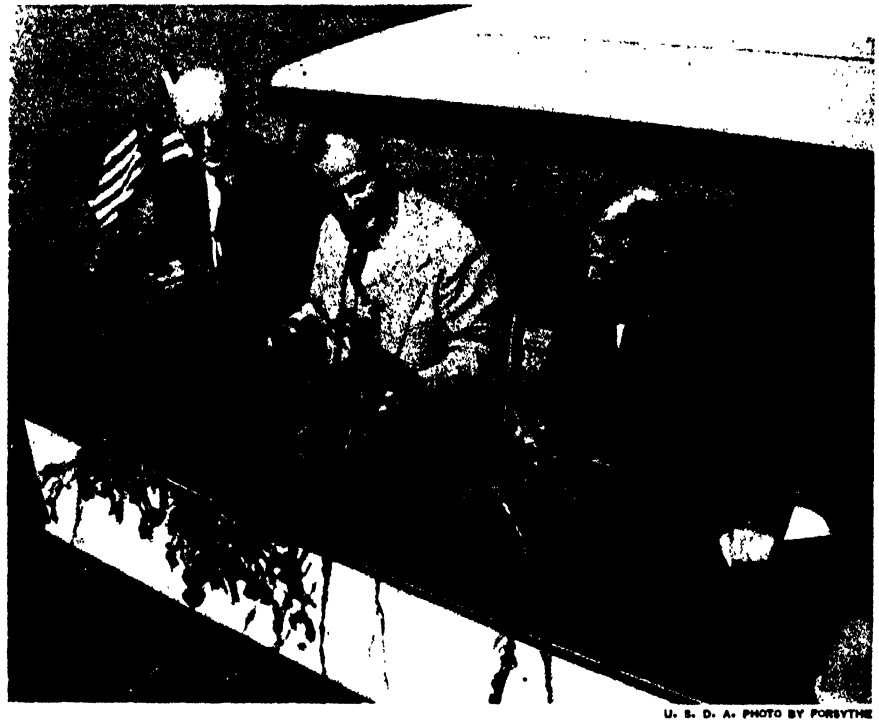
Defense helmets for civilian use, made from cotton and soybeans, being examined by H. G. Knight (left) and W. W. Skinner, Bureau of Agricultural Chemistry and Engineering



thrower has been put to use in killing grass and weeds in cultivating cotton. Smokeless powder may be made from staple cotton instead of cotton linters. A process of hulling cottonseed by steam explosion is under development. Cottonseed-oil recovery can be carried out most economically under present conditions with the use of cooker-expellers in place of hydraulic presses. While there is a slightly higher refining loss, the hexane extraction of rolled and cooked cottonseed meats yields an oil comparable to that obtained by pressing methods. Most quality characteristics studied indicate that it is more desirable to store cottonseed oil as refined than as crude oil. Reyn-O-Cell is building insulation made of fire-resistant cotton. Cotton insulation for dwellings is thought a promising use. Insulating board was made experimentally from cotton burs and stalks and gypsum. Cotton Research Foundation fostered investigations on cotton plant constituents and on properties of cotton fibers. The soybean production from the 1941 crop is estimated at about 111,000,000 bushels. Two new varieties of soybeans are being studied by the New Jersey Experiment Station. Researchers at the Wisconsin Agricultural Experiment Station have developed a new use for soybeans in the preparation of a bread for bees, of one part pollen and three parts soybean flour. Researches in refining soybean oil and in using it in combination with other oils have increased its consumption. A large soybean solvent-extraction unit has a capacity of 440 tons daily; the plant uses the Hansa-Mühle process of continuous extraction, which accounts for about two thirds of the total solvent-extraction capacity of the country. The Hildebrandt system is also utilized and new methods for solvent extraction are being devised. A recently developed process employs furfural. The treatment to which the oil is subjected during the refining processes has much to do with its stability. A distillate containing 14 per cent or more of tocopherols is readily obtainable from soybean oil. The introduction of wet toasting following extraction, to increase the palatability of soybean meal, has helped to abate the prejudice against the use of the solvent-processed product in feeds. Prosein is Glidden casein substitute made from soybean. In addition to its qualities as an adhesive equivalent for casein, new uses have been developed for soybean protein which are not in competition with casein.

Other Industrially Important Plants. Extensive experiments have been conducted in growing castor beans in Texas. The suggestion has been made that it is feasible to culture dual-purpose varieties of castor beans in the Gulf Coast region, for producing oil and cellulose. The U. S. Department of Agriculture announced a method by which 99 per cent of tung oil can be extracted from tung nuts without regrinding. At present the oil return is estimated at about $150 an acre. Perilla plantings in a tung grove in Georgia are flourishing; Texas and Arkansas produce healthy wild perilla; perilla has indeed good opportunities in the South. The production of sunflower seed this year is close to 7,000,000 pounds. Alfalfa is to

BUREAU OF PLANT INDUSTRY, U. S. D. A.

Pyrethrum harvesting machine

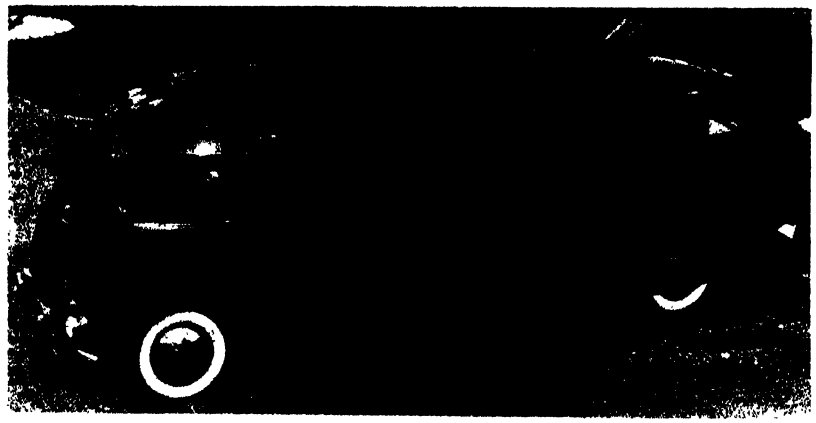
Water chestnuts clogging the channel of the Potomac River attract the attention of Secretary of Agriculture C. R. Wickard (center), W. J. Barden, U. S. Army Engineer Corps (right), and H. G. Knight, Bureau of Agricultural Chemistry and Engineering.

be investigated by the U. S. Department of Agriculture as a source of protein and as a crop yielding carotene, chlorophyll, and hemicellulose as by-products. The same organization is studying the possibility of making commercial use of water chestnuts. The Kentucky Department of Agriculture is trying to expand the raising of coriander seed, whose output has reached 40,000 pounds. The rustic tobacco plant is said to contain several times as much nicotine as ordinary tobacco. At Columbia University the desirable tobacco fragrance was removed from cheap tobacco leaves for addition to the mild, golden leaves with little redolence favored by tobacco buyers. Basic research has been continued on products of milkweed, a plant that stands like an empty glass waiting the wine of scientific development. From the "mud" that results during the process of milling sugar cane, U. S. Department of Agriculture chemists see the possibility of recovering annually some 6,000,000 or 7,000,000 pounds of wax. A pilot plant at Lockport, La., is turning out 200 pounds a day of a plastic from bagasse. Coconut husks have a new industrial use in Puerto Rico—a source of fiber for padding in upholstery and cushions. Charcoal, formerly made from coconut shells, is being produced from wood such as Douglas fir as a result of scientific development. Black Out is a procedure for inhibiting the growth of algae by the use of finely powdered carbon suspended in water. Syn-Char is an activated charcoal for use in refrigerators.

Blossoms and Fruits of Food Investigation

The great garden of food technology blooms unceasingly through scientific cultivation. The recordable advances in food technology make a crowded manuscript full of extra-research episodes, hard to digest. Only 10 per cent of the known foods are used to any extent today. Certain indigenous foods of Europe are taking root here; within the year a number of new factories have been established to make such delicacies. Current research by the Bureau of Home Economics places special emphasis on diet as an essential of national defense. New advances have been made in infant feeding and the nourishment of 20,000,000 school children. With less than 2,000,000 babies born a year infant-food manufacturers are distending their markets with lines of products for older children. It has been predicted that the next step may be foods especially for the middle-aged and aged, an advance that may be nurtured by the growth of interest in geriatrics. Probably 60,000,000 women-working hours daily were saved in 1941 by the use of more convenient foods and better cooking devices.

Canning. There are 402 different kinds of canned food sold in the United States, 85 being vegetables, 64 soups, 55 fruits, 36 fish and other sea foods, 32 meats, 21 juices, and 109 specialties. Active in the field of research are the National Canners Association and its leading company-members.



Dehydration. Fresh results of nutritional research suggest improved types of rations to prevent avitaminoses and to promote efficiency of fighting personnel. Featherweight rations for ski and parachute troops are being studied by the U. S. Army. Also in the experimental stage are thirst-quenching tablets for soldiers on the march. The production of dehydrated, concentrated food has been urged for conveyance by airplanes to Great Britain. Emergency need for concentrated foodstuffs is speeding research by the U. S. Department of Agriculture on the dehydration of vegetables, and the program may be extended to include other foods. Dehydration is superior to sundrying from the standpoint of vitamin retention. Recent advances in the dehydration of foods are likely to effect marked improvements in quality as well as vitamin contents of such products. A number of companies have been working on new processes for dehydrating fruits and vegetables. More will be related on this subject under vegetables, page 17.

Quick-Freezing. A frozen food research laboratory was completed by the Federal Government at Albany, Calif. A suspension of small ice crystals in an invert sugar solution is the typical heat-transfer medium in a new quick-freezing procedure developed at the University of Texas. Storage at 32° in a relative humidity of 65 to 75 per cent will keep in good condition, for at least a year after harvest, nuts now important on the American market. Precooked, ready-to-eat dinners are a novelty in the frozen food business; they are called "hot frost" dishes. Distribution of coffee, quick-frozen to preserve freshness, was started. The housewife of tomorrow will go to her local freezer-locker plant to buy supplementary stocks of commercially frozen meats, vegetables, and fruits. Ice for drinks and other uses is now made in tubular form, 1.75 inches in diameter.

Preservatives. The Westinghouse Sterilamp is effective in destroying airborne microorganisms and therefore serves as a sanitizing agent to maintain an essentially sterile atmosphere in which foods may be exposed or further processed. It has been estimated that molds and bacteria which attack foods levy a toll exceeding $100,000,000 a year, and broad programs aimed at reducing such spoilage losses are under way in several laboratories. Sodium pentachlorophenate (Dowicide G) has been found to inhibit mold on eggs in storage. Monochloroacetic acid is reported to be an effectual food and beverage stabilizer (0.03 to 0.05 per cent). Calcium 2-ketogluconate and licorice resin are said to be useful as food antioxidants.

Vitamins. About 50 industrial research laboratories are engaged in vitamin studies. An increase in the vitamin contents of certain useful plants is to be expected from genetic studies. Current supplies of vitamin A are more than sufficient for a minimum level of medication for the whole population; these supplies can be increased by extracting the vitamin from oils which now pass to industrial use. Improvements have been accomplished in the method for isolating carotene from dehydrated alfalfa-leaf meal by the barium hydroxide process. Provalac is a water-miscible carotene emulsion for application in fortifying foods. Carex is carrot oil in vegetable oil for the addition of color and vitamin A to food products.

It has been estimated that $300,000 went into the production of the first gram of vitamin B_1 by synthesis. In general, cooking destroys about 20 per cent of the thiamine content of vegetables and 40 per cent of the thiamine of meats; usually more than 25 per cent of the thiamine in cooked vegetables is found in the cooking water. Vitamin B_1 is heavily concentrated in tree buds just as it is in grain. Solvamin is a source of riboflavin offered the food trade. It was reported that ordinary brown sugar is rich in vitamin B_6 and biotin. Folic acid is a new member of the

The research car of S. C. Johnson & Son, Racine wax polish manufacturing firm, for use in field investigations, such as in Brazil, to locate new wax supplies

group of B vitamins. Storage and dehydration are more or less destructive to vitamin C in foods. Delsterol D-activated animal sterol is a source of vitamin D for poultry. Drisdol is a brand of vitamin D (from ergosterol) in propylene glycol. Experiments have been made on the addition of lecithin to experimental diets and an effort has been apparent to bring out the indispensability of choline as a growth factor in the human diet.

Fruits. The Washington State Apple Commission has spent $50,000 in research in the past 5 years to determine the food value of its fruit. Probably not more than 20 per cent of the apple crop is processed in any one season. McIntosh apples grown in New York seem to respond best to an atmosphere of 5 per cent carbon dioxide and 2 per cent oxygen at 40° F. and under these conditions will keep satisfactorily for at least a year. Apples packed in oiled paper avoid scald in storage. Semicommercial-scale experiments on the production of sparkling cider by the secondary fermentation of cider indicate that the speed of carbon dioxide formation can be accelerated by the addition of either apple juice or a concentrate prepared therefrom and a small amount of ammonium monohydrogen phosphate. A fruit juice concentrator of radical design was used for preparing products from apples, pears, and cherries; the volatile flavoring constituents collected are combined with the concentrate. Apple-raspberry juice was endorsed by the New York State Agricultural Experiment Station.

Mixed fruits for salads and also boysenberries are quick-frozen in Oregon. Peaches are being defuzzed by some growers in California. An endeavor is being made to find a gas which will improve the color of peaches and nectarines without damaging flavor. While approximately 600,000 tons of plums and prunes are processed annually, there is comparatively little waste because the canned and dried fruit is neither peeled nor pitted; problems facing the industry are surpluses in years of maximum production, discards from sorting tables, and nonmerchantable dried fruit. A company in California is specializing in dated prunes. A richly flavored prune concentrate was announced at the University of California.

A new type of naturally flavored preserved cherry, decorative as the true maraschino, has come from cooperation by the U. S. Department of Agriculture and the New York State Agricultural Experiment Station. The California Fig Institute handles only dried figs, represents 2,000 growers. Two million cases of canned jellied cranberry sauce are packed annually. Watermelon juice, concentrated, may soon be marketed. With better tropical American relations, the mangosteen, cherimoya, guanabana, and sapodilla are good fruits that will become known in this country. Hawaiian Papaya is quick-freezing native fruits for shipment to the United States; a new product is a nectar composed of papaya and pineapple juices. Hawaiian Pineapple has been carrying on researches since 1914 and also participates in the support of the Experiment Station of the Pineapple Producers Cooperative Association. The fate of bromelin has been followed throughout the factory operations of pineapple canning; the enzyme appears in the juice and is there remarkably resistant to heat. The dry wastes of the pineapple industry may be used as carbohydrate food for domestic animals.

The research that established the ethylene gas method of treating green-colored oranges cost about $4,000 and adds an estimated $4,000,000 to the market value of the Florida crop each year and about the same amount to California growers. Citrus fruits will not stand up well in storage if the atmosphere contains more than 6 per cent carbon dioxide or 12 per cent oxygen; high humidities have proved best for storing them. Washing the fruits before storage decreases their keeping quality. Among citrus by-products are fruit juices, vinegar, frozen fruits, alcoholic beverages, candied peel, marmalades, jellies, and orange butter. The U. S. Department of Agriculture methods of making pectin, citric acid, and orange and lemon oils are said to be worth $2,500,000 a year in added returns to citrus growers in California alone. The production of lemon oil in California amounts to 150,000 to 200,000 pounds annually. Gum guaiac and also isothymol are flavor preservatives of lemon and orange oils. All told, lemon products find some 80 industrial uses. By the Sunkist process, a carload of oranges is converted into 200 gallons of juice concentrate. High-temperature pasteurization is recommended to retain the "cloud" in orange juice, followed by rapid cooling to avoid cooked flavors. Orange juice is successfully frozen; very slight loss in vitamin C content occurs in a year's storage of the product. Heating grapefruit before pressing gets rid of most of the objectionable peel-oil taste in the juice. Naringin, which gives grapefruit its characteristic bitter flavor, can be recovered at juice plants; it has likely value in beverage manufacture and medicinals. The ugli is a triple-crossed citrus variety—tangerine, lime, and grapefruit. Deaeration of fruit juices is one of the steps essential to retention of flavor of canned juices. In fruit products sulfur dioxide has been found not only an excellent antioxidant but also a preservative of vitamin C and color. Frulite is thiourea in tablet form for use in preventing discoloration of cut or sliced fruits. Five plants in Florida are now producing between 15,000 and 18,000 tons of dried citrus pulp feed per year. Dried citrus pulp has been determined equal to dried beet pulp as a feed for milking cows, and as a result about 90 per cent of the grapefruit-cannery refuse of Florida is being utilized for this purpose.

Vegetables. Efforts are being made to process vegetables in whole form, to dehydrate them, and to conserve color and flavor. It is doubtful if the basic knowledge upon which successful vegetable dehydration is founded would have been acquired had it not been for the experience gained in the quick-freezing industry. Seven companies operating 15 plants produce dehydrated vegetables, including potato shreds and flakes, onion flakes, carrot cuts and flakes, bean and pea powders, and parsley, celery, spinach, and tomato flakes. Chips from unpeeled potatoes are being made in California; concentrated skim milk and boiled potatoes are combined to yield a new potato chip. Dehydrated potato cubes are of interest to hash canners. Potato starch is produced almost entirely from cull potatoes. Much work has been done on potato starch films. About 125 sweet potato growers have been considering the construction of a dehydration plant in Texas. A manufactory of sweet potato starch was started in Louisiana and the production of stock feed from sweet potatoes was begun in Alabama. Useful in making sweet potato starch, a new machine cuts the potatoes into chips which can be dried readily.

The flash process was adapted for use on tomato juice. Preliminary blanching is said to be of importance in conserving vitamins B_1 and C in snap beans which are to be either quick-frozen or canned. Experimental packs of asparagus with calcium chloride showed that, in contrast to the work on tomatoes and shrimps, no increase in firmness resulted. Chicken noodle, rice, and vegetable soup mixes appeared on the market; Souplet is a tablet from which vegetable broth can be made quickly. Soy grits, a coarse soy flour, is being used in dehydrated soups for the Army. Spinach, pea, carrot, and asparagus flavored ice creams entered on their careers. Commercial mushroom growers have increased their yields 50 per cent in the past decade. Trial plantings of endive, paprika, and other European specialties have been under way in Florida. Celtuce is a new vegetable, a combined celery and lettuce.

Cereal Products. Wheat in various forms contributes 25 per cent or more of the average daily caloric intake of Americans. Chlorine dioxide is a bleaching agent for flour. There are significant differences in the thiamine content of various cereals, in the thiamine content of various strains of the same cereal, and there are indications that regional differences may affect the thiamine content of a single strain. Trends in milling technology have continued toward improvement of the baking quality and nutritive value of cereal products. Wheat germ contains only 5 per cent of the total thiamine of the

Left. Plant of the U. S. Sugar Corp., Clewston, Fla. — capacity, 6,000 tons of cane a day

Below. Harvesting sugar cane in Florida

wheat kernel; all but 18 per cent of the thiamine of the wheat is lost in the manufacture of straight flour. The production of enriched bread includes the use of thiaminized flour or yeast, of vitamins and suitable iron salts for direct addition to the dough, and combinations of these procedures. Plans were made for introducing new vitamin- and mineral-enriched flour and bread to the public. The U. S. Department of Agriculture prepared an "Enrichment Primer".

General Mills reported a baking ingredient to give white bread the nutritional value of whole wheat. Continental Baking began the production of a flour by a process utilizing flotation to retain more minerals, proteins, and vitamin B_1. Peeled wheat bread is made from wheat prepared by a flotation process which removes only the thin epidermis of the berry. Calcium monophosphate enriched with thiamine hydrochloride and other vitamins of the B-complex is a flour supplement. Ferric sodium pyrophosphate containing 15 per cent of available iron has been brought out for flours. The flavor of bacon is imparted to yeast in a new preparation. Standard Brands has featured an enriched yeast. Yeasted peanut butter is a 1941 debutante. A company was organized for the manufacture of yeast from waste sulfite liquor, following the practice in two Canadian plants; it is considered possible to extract lignin and rosin besides utilizing the sugar in this way. Amino acids enhance the growth of yeast.

The macaroni industry has taken steps to tie in with the vitamin fortification program of the milling and baking trades. Wheatasoy is a breakfast food and Zoy-Koff is a coffee substitute coming from Madison College, Tenn. Yum contains wheat gluten and soybeans. "Grass bread" carrying grass powder has been introduced; in this class is Meadowkist bread. Quaker Oats has entered the manufacture of grass products (Greenmilk; Cerophyl). There is also frozen grass for chicken feed. Frozen cookie dough that can be kept a year before baking came before the public. An oat loaf was promoted in the bread field. The protein found in oat by-products is held inferior to that in the whole oat grain. Ready-to-eat cereals were presented by two companies.

Starches and Sugars. Ordinary popcorn expands from 18 to 24 times its volume upon popping, but some of the new hybrids enlarge as much as 30 times. The corn-refining industry has, during the past 10 years, consumed about 40 per cent of the corn reaching primary markets or 20 per cent of that sold off the farms, equivalent to somewhat more than 3 per cent of the total annual output. About 98 per cent of the starch manufactured in the United States is produced by the corn wet-milling industry, which sells one third of its output in the form of starch and converts the remainder into other products. Starch has been made synthetically from glucose at the University of California; the molecular structure of enzymatically synthesized starch has been studied. Starch may soon be produced commercially from kafir, research work at Kansas State College indicates. Starches can be differentiated by the rate and degree of response to the action of soybean amylase.

The sugar, pentosan, and galactan contents of edible varieties of soybeans have been determined at different stages of maturity. A low pectin content of soybeans may explain their failure to soften materially during cooking. About 40 per cent of the total sugar production of United States refiners is used in the commercial manufacture of foods and beverages. It has been proposed that to refined sugar there be added 20 per cent of its weight of skimmed milk solids to supply vitamins and minerals. Sugar is gradually finding new industrial applications, such as in the preparation of chemicals and in various other ways—for example, in steel-products technology to prevent splashed metal from solidifying on the walls of molds during pouring. Air-dried sugar-beet pulp treated with anhydrous ammonia becomes a feed high in water-soluble nitrogen. Hydrolyzates prepared from extracts of dried Jerusalem artichoke chips ferment somewhat more satisfactorily than hydrolyzed aqueous pulps of the dried chips or the fresh tubers; the solvents formed by the butyl-acetone organism from fermentations of Jerusalem artichoke extract hydrolyzates are identical with those from fermentations of corn

mash and are produced in about the same ratio. Candy manufacturers are coping with problems of rising costs, raw materials, and packing. It is claimed that chocolate of higher melting point can be obtained by hydrogenation. Oat flour is espoused to keep chocolate candy bars from softening in summer heat. University of New Hampshire scientists are hunting high-yielding sugar maples, so as to study the best manner of reproducing good stock. One fourth of all the maple syrup goes into flavoring sauces for tobacco. An alginate specialty is a stabilizer for icings and meringues.

Oils and Fats. Fluffo is a vegetable shortening. A heavy consumption of refined cottonseed oil was reported: the oil has represented 40 per cent of the total of all ingredients and 50 per cent of the fats used in the increased production of margarine, and there has been an unprecedented consumption of cottonseed salad oil. A substitute for coconut oil is a beef fat, used as a lubricant in confectionery manufacture. There has been concern about the alleged adulteration of olive oil with tea-seed oil by wholesale dealers and adulteration with peanut oil by retailers. A study of the changes in composition of ripe olives during pickling shows that little saponification occurs through action of the sodium hydroxide used to destroy oleuropein, the bitter glucoside of the olive; most of the water-solubles are nearly completely removed. Normally 600,000 to 800,000 cases of canned olives are packed and 300,000 to 500,000 gallons of olive oil are produced annually. Lard has been found superior in digestibility to hydrogenated cottonseed oil at each level of fat intake. 6-Hydroxychromans, including α-, β-, and γ-tocopherols, 5,7-dimethyltocol, 6-hydroxychromenes, 5-hydroxycoumarans, 5-hydroxycoumarones, and 5-hydroxyisocoumaranones, are effective stabilizers for lard. Lard is now packed very cold as lining for cargo holds in ships, serving as insulation for perishable foods and rendering unnecessary refrigerated chambers.

Flavors and Beverages. Vanilla beans contain a large amount of peroxidase, and a complex peroxidase system (phenol, peroxide, and enzyme) is present even after the curing process is finished. It is suggested that vanillin may be an intermediate product in the development of the desired aroma and that oxidation products of vanillin may contribute thereto. Vanilla accounts for 51.26 per cent of all ice cream flavors. A method was described for securing a larger yield of flavor from spices by an explosion process. Coffee roaster units were installed in many retail stores; vacuum-packed tea arrived. The addition of thyme leaves to tea is said to make a pleasing beverage; the various mints are also reported to improve iced teas as well as fruit juices. Tea waste, imported chiefly from British India, has been used in the manufacture of caffein; competition from caffein imported from Brazil may be encountered in 1942. Iron added to beer in the amount of 1 p. p. m. was said to cause the foam to draw away from the sides of the glass. Researches were published on the action of sunlight on beer and on tropic-stable beer. National wine consumption reached an all-time high of about 2.75 quarts per capita.

Packaging. Notable progress has been made in vegetable packaging during recent years. Many merchandising men believe the time is not far distant when all fruits and vegetables will be more carefully packaged and identified. The Can Manufacturers Institute is carrying on work including problems posed by restrictions on tin supplies as well as the use of plastics for packaging purposes. Cans are well standardized, but fruit and vegetable freezers are still experimenting with packages. In recent studies by the U. S. Department of Agriculture, specialists found wide differences in the protection afforded by various types of paperboard packages and the linings and wrappings used with them. An effort is being made to provide paper food containers that are as satisfactory as possible from the hygienic as well as other points of view. Dacca Vapo-Pak is a type of waterproof folding carton. Pertinent data have been reported on the temperature and time combinations of paraffining for treatment of paperboard. Flavorseal waxing is described as keeping fruit fresh by protecting against loss of weight and allowing adequate "breathing". Containers are sprayed with sodium hypochlorite solution to control molds, bacteria, and malodors in the fruit-packing industry. Cellophane has more than 5,000 uses in packaging. Pris-O-Matic is a cellophane candy bag. Zip-Tape openers are featured on some cellophane confectionery packages. Special cellophane packages have been developed for fresh corn. Pliofilm is being used in the packaging of dehydrated foods and soup mixes. Food bags are being made from nylon. Glass pails with wire handles for food products have been growing in popularity. Canpour, a new container, is provided with a plastic pouring spout which enables the conversion into a pitcher. Hotcans consist of one can inside another with a chemical in between, which heats on contact with the air, thereby obviating in packed foods the necessity for warming. Novel plastic containers molded in the shape of the fruits or vegetables they hold have been developed experimentally.

Milk. The addition of urea to the basal ration of cows definitely increased milk production. The economic practicability of fermenting the lactose in whey to ethyl alcohol has been studied. Pasteurization of milk causes no loss in vitamin A; fodder preservation by ensiling conserves carotene far better than ordinary drying. The proteolytic enzyme trypsin is effective for inhibiting the oxidation of milk which results in tallowy flavor. Gum guaiac exhibits antioxygenic properties in milk; crude sugar inhibits the development of copper-induced flavor. Deaeration prevents oxidized flavor and the destruction of vitamin C. Golden-V, introduced in California, is a pasteurized and homogenized grade A milk fortified by the addition of vitamins. Malted milk has lately joined the list of vitamin-enriched products. Vacreation or vacuum pasteurization of ice cream mix improves the flavor of ice cream where scored fresh. It is said ice cream manufacturers of size are using 28 different flavors to satisfy the public. The dairy industry has entered the dog food business by the introduction of evaporated milk, dextrose, and cod-liver preparations. Opro is a special food for chinchillas developed in Los Angeles. Tamanite is a surface coating to protect especially against lactic acid.

Cheese. Organoleptic evidence exists for the statement that even under modern conditions cheese-making is not by any means a fully controlled industrial process. Of late years research has made cheese manufacturing less erratic, but it is still an art that sometimes breaks down. The development of process cheese has no doubt been a factor stimulating consumption of American cheese. Cheesemakers are producing substitutes for Norway's gjetost, the blue cheeses of France and Belgium, Holland's Gouda and Edam, and Italy's asiago and provolone. Vacuum packing of cheese appears to be more satisfactory than packing in cans with a valve to allow escape of gas. The treatment of cheese with a solution of propionic acid or of the sodium or calcium salt of this acid markedly retards the development of mold.

Poultry. Much scientific work has been done in the field of poultry nutrition. At Cornell there has been evolved a low-cost process for smoking poultry which is available for general use. Chickens are now pickled in brine, seasoned, and smoked at a cost of about $2.00 per unit, compared with an average of about $7.50 for smoked turkey. Smoked duck is also available. Smoked turkey sausages and smoked turkey paté are pleasing dainties. The U. S. Department of Agriculture has shown it is possible to supply small white turkeys to fit the needs of little families. Soybean meal is a good protein source in turkey rations.

Beef. According to the U. S. Department of Agriculture, beef from cattle fattened on grass ripens as well as beef from cattle on grain and is just as juicy and flavorsome. Quick-frozen preroasted beef is being shipped from Argentina.

"Woven" steaks are made by putting slices of meat through rotating dies, converting under pressure to uniform thicknesses. One of the uses for dry-ice may be in the tenderizing of beef; the idea is that carbon dioxide will keep bacteria and mold-forming organisms from getting the oxygen necessary for their growth. The Tenderay process continued to gain favor. Macin, an enzyme from Osage orange, has been proposed for use in tenderizing meat. Wimpys are hamburgers in cans.

Pork Products. An "ice box in reverse" that ages hams in 10 to 12 weeks, instead of the year or more required by the old-time farm method, has been developed by the Maryland Agricultural Experiment Station in cooperation with the Federal Bureau of Animal Industry. That mildly cured, fine-grained ham of prewar Poland is being produced under the supervision of Polish experts.

Gelatin. The Army Quartermaster Corps has found advantageous the gelatin coating of meats. Vitamin B_1 fortified gelatin is a newcomer. Gelatin, casein, and albumen compositions are said to be softened and made elastic by tetrahydrofurfuryl alcohol and certain derivatives thereof.

Marine Foods. During the spring 23 Iceland-preserved fish items were offered in American markets. Pinch-hitting for anchovy paste is a salted salmon paste from the State of Washington. A specially prepared quick-frozen fish product comes in fillets, breaded with potatoes and corn meal, for placing immediately in the pan without preliminary defrosting. Sea Pep is a standardized sardine oil for poultry feed. Coon or bunch oysters may become of commercial value, according to a study in progress. Calcium chloride was welcomed as an addition to brine for shrimp to retard softening of the canned product. Maine rock crab will soon be on grocery shelves in cans. Nipicide is used in making antiseptic ice for the fishing industry.

Advances Relating to Natural Gas and Petroleum

Research has autographed the history of hydrocarbon technology.

Natural Gas. By examining gases removed from samples of soils, to detect hydrocarbons present, it is possible to locate underground deposits of oil and gas. The possibility of recovering methane from coal in situ before mining has been studied. The U. S Bureau of Mines reported on the flow of natural gas through high-pressure transmission lines in cooperation with the State of Oklahoma and the American Gas Association. Natural-gas hydrate, formed under pressure with water, behaves as a solid solution. The high-temperature method of gas-engine cooling has passed the experimental stage and is regarded as safely applicable to natural-gas engines of conventional design. The utilization of propane as a standby fuel for natural-gas engines was described. Propane was proposed as a refining agent for tall oil. Attention was called to the conversion of butane to 2-methylpropane, with good yields. The U. S. Government's plant in Texas produced about 14,000,000 cubic feet of helium. For 3 years the Bureau of Mines has supplied helium for use in weather-observation balloons.

Petroleum Production. Petroleum is the motive force of modern war. The total crude petroleum reserves amounted to 19,025,000,000 barrels at the beginning of 1941. Studies in the correlation of crude oils with geological environment have yielded a method for distinguishing between crudes produced from the same horizon and regarded as practically identical by true boiling-point distillation. Horizontal drilling of oil wells, after 25 years of working out the problems involved, appears to be an accomplished technique of the petroleum industry, bringing more oil production from certain types of fields and offering promise of further extension in the future. Flocculation of colloidal particles increases and deflocculation decreases the viscosity of drilling muds. Hectorite is a Californian hydrated magnesium silicate for employment in place of bentonite in muds. American Cyanamid's Aeroflo is used to control the viscosity of muds. Shell oil-base mud contains stove oil as the liquid medium; oyster shells, limestone, or barite for weighting materials and to impart initial plasterability; lampblack to give gel strength and structure; and blown asphalt to confer final plastering properties. The use of demulsifying agents in acidizing a well often brings a satisfactory pipe-line oil in a much shortened time. Brine properly conditioned is effective as a flooding medium for secondary recovery of oil. The American Petroleum Institute completed a comprehensive 10-year test of 19 protective coatings on operating pipe lines; no coating afforded complete protection to all pipe to which it was applied. The wide construction of reinforced concrete tow barges to transport petroleum products and other bulk commodities has been under consideration.

Petroleum Refining. The United States has ample refinery capacity to take care of any expected increase in demand for petroleum products. Nearly one-third of this capacity is less than four years old. As compared with 1917 there are twice as many petroleum refineries with four times the refining power: four times as much crude oil is processed and about twelve times as much motor fuel is produced; the yield of gasoline from crude oil and the output of lubricating oil are doubled; more than three times as much fuel oil is made. The U. S. Bureau of Mines published a method for reducing asphalt-bearing crude oils to straight-run asphalts by distillation at atmospheric and reduced pressures. The research sponsored jointly by the National Bureau of Standards and the American Petroleum Institute, begun 14 years ago, has led to the identification of 62 hydrocarbons in the gasoline and kerosene fractions of petroleum, as well as a large number of homogeneous fractions from lubricating oil; the findings have been reported in 79 papers. As more and more synthetic organic chemicals are being made from petroleum refinery and natural gases, engineering trends will probably continue to focus around such problems as gas handling, high temperature and pressure equipment design, fractionation, heat transfer, polymerization conditions, and safety and hygienic features.

A well in Kansas into which more than 18,000,000 barrels of oil-field waste brine have been pumped. The disposal of such brines is a troublesome problem on which the U. S. Bureau of Mines has done work. One solution is to put the brine back where it came from.

Chemical Products. Further research progress has been recorded on petroleum refining by-products as potential sources of pharmaceutical intermediaries. Aromatic solvents derived from petroleum by the Edeleanu process are said to exhibit efficiency. Several processes have been developed whereby toluene can be manufactured from petroleum. Standard Oil of California announced new outlets for its cresylic products from refinery wastes. Two benzo(h)quinoline homologs have been isolated from California petroleum. The separation of 2,3-dimethyl-4,8-diethylquinoline and the use of sulfur dioxide in segregation of a second new nitrogen base, 2,3-dimethyl-4-ethyl-8-*n*-propyl-quinoline were described.

Evaluation of aviation fuels at Bartlesville, Okla., Station, U. S. Bureau of Mines

Gasoline. Gasoline is sufficiently powerful to propel a car 450 miles to the gallon, specialists contend, if means could be devised to obtain completely efficient consumption. Twenty-five per cent of all the motor fuel produced is used by farmers. Dated gasoline is being promoted in Connecticut.

Since 1935 a committee of the American Petroleum Institute has been studying all aspects of the proposal to utilize alcohol fuels. This group has found that alcohol cannot be manufactured from farm products under present and prospective conditions for less than five to six times the cost of gasoline, and maintains that a 10 per cent mixture of alcohol with gasoline would increase the Nation's fuel bill by $690,000,000. About 20 plants are producing 100-octane aviation fuel. The largest volume of octane is made by the alkylation process, the second largest by isooctane, and the third by neohexane. Polyform units are operating in five Gulf Oil refineries. The "fluid catalyst" petroleum cracking process has been revealed by Standard Oil Development. It is said to permit more continuous cracking and lower costs than intermittent cracking using solid catalysts. The net effect of the hydroforming process is to dehydrogenate; this procedure can yield a high-grade aviation gasoline or can be modified to give a product having upward of 80 per cent aromatics.

Gasoline Treatments. Gasoline sweetened by the solutizer process exhibits improved odor, lower sulfur content, and an increase in octane number and lead susceptibility. The use of a mixed solutizer solution, a strong alkali solution containing an isobutyrate (the solutizer) and alkylphenol salts, has been proposed to reduce the removal of alkylphenols from gasoline. A process to demercaptanize gasoline employs a solvent containing caustic soda and methanol. A gasoline-sweetening plant utilizing the Linde copper-slurry process was shown in an article. A metal deactivator to increase the storage stability of petroleum distillates has as its active constituent N:N^1-disalicylidene-1:2 diaminopropane. Soybean lecithin has been put forth as an inhibitor for improving the quality of leaded gasolines; it is said to stabilize against change and to combat corrosion. Expansion of the Ethyl manufacturing plants at North Baton Rouge at a cost of $2,500,000 and the adoption of new production methods have made possible the substitution of hydrochloric acid for chlorine in the manufacture of tetraethyl lead. The use of activated glycerides is claimed to prevent precipitation of metallo-organic compounds as well as to ward off haze on exposure to light. American Cyanamid's Aeroclear is an ethyl gasoline haze inhibitor.

Gasoline Improvements. In gasoline, for both ground and air vehicles, the principal prospect of a further major improvement appears to be in degree of freedom from knock. Leaner air-fuel mixtures in modern automobile engines, as compared with those of 1927, have produced a saving of about 18 per cent in gasoline consumption. Defumer is a gasoline-engine control to eliminate fumes from exhausts as engines decelerate. The preheating of carburetor intake air and the designing of nonicing carburetors reduce the need to limit aviation fuel volatility. Means to prevent the icing of the intake systems of aircraft engines, one of the known hazards of aviation, is the object of an extensive investigation at the National Bureau of Standards. Ceilings of military planes are steadily being elevated and the factor of climb is being met by evolving more powerful engines and larger propellers; researchers are working on a 40,000-foot level. Two types of supercharge engines are under development. Compounds such as diisopropyl formal blended with aviation fuels are claimed to aid vaporization in high altitudes. Improved protective coatings for interiors of aviation fuel drums have been devised, especially to prevent the contamination of gasoline with iron rust or zinc oxide particles; resin-type coatings have received much attention.

Lubricating Oils. Simplification of motor-vehicle lubrication and improvement of lubricant service by reducing the number of types of lubricants required are being developed jointly by representatives of the petroleum and automotive industries. Higher engine temperature and pressure require an oil of greater paraffinicity and oxidation stability. This type of oil can be obtained from many crude petroleums, in good yields, by solvent extraction and by the use of additives. Addition agents are thought capable of bringing about marked changes in the degree of oxidation occurring in lubricating oils; they may also influence the direction and character of accompanying reactions. New types of metal salt addition agents for lubricating oils have been derived from alkylated phenolic compounds. Lubricating oils of superior load-carrying capacity and decreased tendency toward oxidation and carbon formation can be made by incorporating small amounts of the dialkyl esters of phthalic acid. Diethyl oxalate is employed as a corrosion inhibitor, particularly in oils compounded with metallic naphthenates, to combat piston ring sticking.

Special Lubricants. Little is known about the practical evaluation of a grease by laboratory tests. It looks as if machinery would be more and more slushed with waxy coatings. Carbowax compounds are being used with water-soluble lubricants in wire-drawing and metal extrusion. Special lubricants have been employed for use in drawing and machin-

ing aluminum and its alloys. Nonscratch 1025 is a drawing lubricant; L&H Perfected is for deepdraw work on metal sheets. Gulf Oil has two new lines of lubricating greases for ball and roller bearings. Santolube 261 is an additive for crankcase oils, an inhibitor of bearing corrosion. Lubriplate lubricants in collapsible tubes are intended for ball bearings and gears. Van Caloria lubricants vaporize above 400° F., leaving a film of colloidal graphite; Grafo assembly compound is a mixture of colloidal graphite and oil for conditioning bearings; Savamotor is a lubricating oil for crankcases of internal-combustion engines that contains graphite; a new dry lubricant is graphite in suspension in carbon tetrachloride, which evaporates upon application; Kano Ovenoil consists of colloidal graphite in a liquid carrier for use as a lubricant at temperatures to 1,800° F.

The problem of oil refining for dielectric application will be touched upon in passing. It largely centers on olefin removal without a major reduction in aromatic hydrocarbons, the presence of which is necessary to obtain maximum stability. The problem is particularly difficult because there appears to be no oil property which can be used to predict the suitability of a product for dielectric impregnating use. Novel oils, creations of organic chemistry, are watch and precision-instrument lubricants. M-56a is the new Elgin watch oil, a synthetic product. Celvacene is a vacuum grease; butyl phthalate, butyl sebacate, Amoil, and Octoil are pump lubricants. To lubricate a rotor operating in a vacuum in an x-ray tube, where oils and greases are not permissible because of their high vapor pressures, General Electric has found a thin film of barium to be the solution. Penetrant is a lubricant obtained in the Paluszek process of degumming castor oil. Degummed castor oil has a solvent action upon sludge and engine varnish.

Diesel Engines and Fuels. The Diesel-engine business, excluding navy contracts, has been about double that of 1940. The mass production of Diesel engines by the automotive industry has been urged. It is calculated that a considerable saving in weight could be accomplished with Diesel-powered airplanes if their engines were boosted with oxygen for the take-off. Feeding oxygen into the intake air of a Diesel engine has been shown to increase its power output by 60 per cent without detonation or other ill effects. In Diesel fuels a problem is to improve ignition quality, a property measured by its cetane number; certain addition agents, such as organic polysulfides, will raise this number. Technologists are working on a device that will measure the density of Diesel-engine exhaust smoke in order to gage the suitability of the oil and the condition of the engine. The Surfide process treats Diesel-engine liners in a concentrated water solution of sodium hydroxide and a small amount of sulfur to produce a wear-resistant coating. Fusol is a solvent for adding to heavy fuel oils to dissolve sludge and to combat carbon formation in preheater tubes and oil burners. The National Bureau of Fire Underwriters has issued standards for the installation of oil-burning equipment.

Waxes and Asphalts. A process for the fractional fusion of waxes was announced by Sturtevant in cooperation with Socony-Vacuum Oil. High melting-point waxes, 160° F. to 300° F., are available. The Asphalt Institute reported on typical asphalt stabilization projects, on the construction and reconstruction of highways to meet military needs, and on the choice of surfacing types for airports. The National Bureau of Standards studied asphalt-prepared roofings and shingles. All the constituents normally present in an asphalt are susceptible to photooxidation; while the resistance to this action may be increased somewhat by selection of asphalt source, it is much more important to protect an asphalt surface, as far as possible, from exposure to sunlight. U-Mix-It consists of asphalt in pulverized form for use in paints or as an adhesive binder. Wearcoat is asphalt processed to a rubber-like consistency for application as a surface seal on expansion-joint fillers. The method of mixing bitumen and latex for road use is to heat the bitumen to 150° and stir in 5 per cent of latex powder. Sulfur ground with asphalt and kerosene forms stable suspensions from which aqueous emulsions can be prepared, using a sulfonated alcohol as an emulsifying agent. Liquid esters of abietic acid are being utilized to increase the speed of penetration of asphalt into cellulosic materials.

Dendrotechnology: Science Flourishes in Sylvan Scenes

Fresh out of the laboratory wrapper, a wood-treating process speeds up the aging of hardwood by injecting synthetic resin into green wood, at the same time removing the sap and moisture. Wood impregnated with a saturated solution of calcium nitrate shrank only 7.7 per cent as much as normal wood. The chemicals that have demonstrated most promise in the seasoning of wood are urea, invert sugar, and a mixture of them. Urea has been used in the seasoning of tidewater red cypress. Other work has shown so-called degrade losses in lumber, caused by cracking and splitting, can be practically eliminated by treating the green wood with urea. A wood flour plastic is employed to plug worm holes in lumber.

Wood Preservation. In a 25-year test of shingles from different kinds of wood, creosote markedly lengthened the life of the roof. Kolineum is a refined creosote wood preservative. Penetex is a preservative for wood floors. Improvements have also been made in floor dyes. Chemonite is a preservative for wood sills, posts, and piles. Permatol is being used in treating ties and poles. Permasan 116, a pentachlorophenol preparation, is employed to guard wood against the effects of moisture, fungi, insects, and decay. Copper termite shields have been specified in some construction for national defense. Eighty-five per cent of the cross-ties now laid by railroads are treated to preserve their life, compared with about 43 per cent in 1920. Approximately 50,000,000 cross-ties are placed annually by the railroads. The American Wood-Preservers' Association issued a report on fireproofing. De-Oxo-Lin is intended to render weeds and grass fire-resistant for improving forest fire-breaks. The metal-treating of wood materials is being studied several places.

Plywood Products. Imports of balsa wood are around 6,000,000 feet annually, for use as insulation, in the construction of model airplanes, and by aircraft manufacturers for fairings and for inside walls in the passenger compartments of commercial planes. To help aircraft builders the U. S. Department of Agriculture is seeking better inspection methods for the selection of wood. With the development of improved plywood resulting from the use of plastics, especially phenolic and urea resins, the growth in specialty applications, such as furniture, housing, radios, shipbuilding, and aircraft, has been large. Four general procedures are employed for fabricating aircraft parts by molding plywood with plastic binders—Aermold, Bellanca, Duramold, and Vidal processes.

A method has been devised for combining plasticizing and pressure whereby wood veneers can be converted into dense, tough material, interchangeable with metal for airplane propellers, radio masts, small fixed fittings, and beam reinforcements at fastening points. A building material with "compregnated" wood uses a partially polymerized phenolic resin solution driven into the cellular structure of the wood. Research by the John B. Pierce Foundation has led to building one-floored houses constructed largely of resin-bonded plywood. Plxweve is spruce bonded with phenolic and urea resins.

Wood Specialties. In Mobile a company is working on a low-cost plastic material from sawdust. Slat-Rack mat is formed of hardwood secured to rubber-supporting strips. Marlite Velvetex is composed of an oil-treated pressed-wood base with a baked surface finish; Horizontaline is this product with a plain surface having a horizontal scoring. Saferized Palco Wool insulation comprises fire-resistant shredded redwood bark fibers. Wood fiber blankets, bats, and insulation are being made to specifications. Cushionstone is a fibrous acoustic material. Fiber is being produced from Yucca.

Lignin. Cellulose, according to some authorities, probably consists entirely of chains of anhydroglucose units in varying degrees of association, ranging from a dense, crystalline, acid-resistant fraction to one that is amorphous and easily hydrolyzed. Wood and cotton celluloses appear to differ structurally. A continuous process for the hydrolysis of wood with dilute acid has been developed, resulting in the production of lignin and lignocellulose for plastics, as well as acetic and formic acids, furfural, and wood sugars. It seems likely that by irradiation lignin in wood meal is brought into a higher state of activity than isolated native lignin. The use of crude lignin powder for the removal of iron from water has shown promising results. Lignin paste appears satisfactory for bonding such floor coverings as linoleum, rubber, and felt base to subfloors in dry locations. The lignin and vanillin plants at Rothschild, Wis., have been increased over 50 per cent. Citrus wood may be a usable source of lignin.

Pulp Sources. Few American industires have been more affected by war than the manufacture of pulp and paper. In the past decade domestic producers of paper took from 32 to 38 per cent of all wood pulp moving in international trade. The United States has imported over 70 per cent of its newsprint paper consumption, chiefly from Canada. Upward of 230,000,000 cords of pulpwood annually can be taken from Georgia and the Carolinas without in any way exhausting this immense reservoir of pine. Experiments have shown that sweet gum is easily defiberized to produce a comparatively high yield of bleachable pulp. Although the soda process can be satisfactorily applied to this wood, the sulfate process or its modification (the soda-S process) gives superior results. The U. S. Department of Agriculture announced it would subsidize the use of 10,000 bales of low-grade cotton in the manufacture of high-quality writing paper. Crane C2 process treats cotton fibers for paper production.

Sapwood of both softwoods and hardwoods yields stronger pulps than obtained from heartwood. The four most plentiful hardwoods in the northeastern states are white birch, yellow birch, beech, and maple; all can be converted into pulps by the acid sulfite process. The U. S. Department of Agriculture has called attention to a high-yield semichemical pulping process that enables the use of the "weed" hardwood species in newsprint paper. Studies have been made on brown mechanical pulp from yellow birch. The Northwest Research Foundation has developed a process for making α-cellulose from aspen. High-α pulp from aspen was found to acetylate readily by the Forest Products Laboratory. Consisting largely of cellulose and pentosans, the flax shive is regarded as a potential source of α-cellulose, chlorophyll, pectin, and xylose. Cigaret paper is being made from Minnesota flax.

Wood Pulping. There is an increasing tendency to study from the point of view of chemical kinetics the reactions involved in wood pulping. The wood sugars in waste sulfite liquor may be utilized for the production of acetone and butyl alcohol by fermentation. The pulping action of calcium-base sulfite liquors, which do not ordinarily give complete reduction of Douglas fir, has been improved by high sulfur dioxide concentration and long time at low temperature. Forced circulation in sulfite-pulp digesters offers a nearer approach to uniformity than has been obtained with conventional quick-cook systems. A penetration and acid-recovery process for sulfite mills employs the principle of interconnected digesters which form a closed system. In pulping conifers a small but definite amount of sodium sulfide is necessary to obtain optimum pulp properties.

Chemicals for Pulping. A sintered mixture of sulfur and soda ash in a ratio of about 3 parts of sulfur to 10 of soda ash is being produced by Mathieson for use in the manufacture of pulp for kraft paper. Another substitute for salt cake has been offered in the form of a combination of gypsum and soda ash. Through the employment of gypsum, white liquors of higher sulfidity can be prepared than by the use of salt cake and the sulfidity can be raised more rapidly if desired. A study of the factors involved in the use of gypsum has been made by the Institute of Paper Chemistry. Sodium chlorite offers the possibility of securing high brightness in fully bleached pulp without damage.

Cellulose Felts and Boards. Papier-mâché is regarded as the first plastic. Asplund pulp for the roofing and flooring felt industry is produced by softening wood through heating in a defibrator before pulping. Forest Fleece Silkene padding consists of layers of spot-glued wood-pulp sheet. Cell-U-Blanket, Masonite's lightweight insulation, has a core of Cellufoam; Masonite parts are replacing metals in radios, fans, and pianos. Boards made from waste cellulose by the Loftin process are said to have high strength and to be unwarpable. Samsonite is built up of laminated material with butyl methacrylate polymer as a bond. Among paper products, paperboard constitutes 38, wrapping 14, and printing 13 per cent of the total consumption.

Wallboards. The Insulation Board Institute is carrying on investigational work on extending the usefulness of fiber insulating boards as interior wall finish. Colotyle is a plastic-coated wall sheet. De Luxe Monowall board is a tile-design wallboard of Armstrong Cork; Dubl-Thik Fibre-Tile is a compressed wood fiber wallboard with a tile-scored surface. Exlin is pressed from spruce cellulose. The plastic sheet Farlit is veneered to board cores. Homasote is an insulating fiberboard for wall construction. Ludlite Bord now has a surface of Protex paper. Temlok De Luxe Structural Unit is an insulating board in panel and plank forms. Linoleum manufacturers have been experimenting with substitutes for cork and burlap. Korktone is an insulation consisting of granulated cork secured on a fabric backing by a rubber binder.

Adhesives and Coatings. The Institute of Paper Chemistry published research on the effect of the adhesive used in the fabrication of corrugated fiberboard on the strength and serviceability of corrugated fiber boxes. Sveen glue solution is said to flocculate filler and fibers, to increase their retention, and to give added freeness to the stock on the wire on closed as well as open systems. Prosize consists of free rosin particles with a protein to stabilize the suspension. Tall oil is a potential source of various derivatives made from the separated rosin and fatty acids. Indusoil is West Virginia Pulp and Paper tall oil. Pectates are poor adhesives but may be used to prevent substances from sticking to paper. The war has induced many mills to change from tapioca to corn starch. A correlation has been found between the molecular weight of the starch, the height of the peak in the consistency-temperature curve, and the increase in strength imparted to a paper sheet where the starch is utilized in a condition of maximum dispersion. The outstanding use for zein appears to be in the paper-coating field. The paper industry is experimenting with hydrogenated vegetable oils in attacking coating problems.

Coated and Impregnated Products. The aqueous type of urea-formaldehyde resins is being applied in high wet-strength paper. Water-soluble alkyds may prove of interest as beater sizes for special purposes; they can also be incorporated into coatings to improve toughness and adhesion. Applied to sized sheets, American Cyanamid's Paper Resin 605 increases water resistance and triples the wet strength. Waxine Sizes 350, 357, and 358 are wax emulsions containing moderate amounts of unsaponified rosin. Resin-X-Crepe is a resin-impregnated paper for use in stampings. Blackout Sheet is a black kraft which sticks to industrial windows; Daylight Vent is a sliding light-tight shutter to be applied along with it. Centraline Road Coat consists of waterproofed kraft combined with burlap and paper backing. Corroflex is a waterproofed flexible corrugated packing material with an outer covering of kraft. Scutan is an asphalt-infused kraft.

Printing Papers and Processes. Coated paper is the most popular for house or-

gans, 65 per cent of them using the highly finished sheet; next comes offset stock, utilized by 18 per cent. Levelcoat is smooth coated book paper made by a new process. New developments occurred in direct-from-zinc printing of newspapers. Printing Plates Research launched a 3-year program at Battelle Memorial Institute. Zein is reported useful in solid color printing. Solfast outdoor bulletin colors are said to be sun-resistant. A development in the treatment of papers to minimize misregister of color prints in offset lithography is the controlled exposure of the paper to correct moisture conditions.

The Velo process is employed for publication printing; it is of promise for the converting industry. Perfumed ink is for use in newspaper advertisements. Aruba-base ink contains a bitumen which imparts smudgeproof qualities. A new "water-based carbon ink" is being tried for correcting "second impression off-set" in newspaper printing. Vaposet printing ink is dried by application of water vapor. Hydry printing inks consist of pigments and a vehicle of synthetic resin in a high-boiling odorless organic solvent. A curl-proof carbon paper was marketed. The removal of printing ink from waste paper is described as facilitated by including a small proportion of a divalent nickel salt in the alkaline solution employed for this purpose. In another process waste paper is defibered in an alkaline medium solely by the use of internal friction, so that ink can be removed and the original fiber reclaimed in an undamaged state.

Waterproofed Paper Novelties. About 425,000,000 rolls of wallpaper were sold in 1941. Research in this field has brought fadeproofness and washability. Copper Pak bag paper is a waterproof, antisulfur protection. Jaite waterproofed paper sleeping bags have been suggested for military use. Seat covers for cars are made of water-repellent paper. Masks for surgeons as well as industrial workers are being manufactured of paper. Papertone is a liquid paper preserver. Lamcoting preserves periodical files by cellulose acetate lamination. Protecto-Phane for paper protection is a thin cellulose acetate film. Bookbindings of durability and flexibility are being made with polyvinyl acetate adhesives.

Blueprinting and Photographic Supplies. Postex is a paper for the production of blue lines on a white background in ammonia-vapor dry-developing machines. Matte transfer film is a photosensitive material used in making hand-layouts from blueprints on metal sheets to be employed for templates. Special high-power mercury arc lamps have been devised to speed up the production of blueprints. Kotavachrome is a process for making color prints and enlargements from Kodachrome transparencies; Kodak Minicolor prints, with cellulose acetate base, are enlargements from 35 mm. or Bantam Kodachrome transparencies. Kodacolor is a new color film that makes a transparent negative from which prints can be easily produced on paper. In Varigram the sensitivity of the silver chloride emulsion has been extended to the blue-green by the use of dyes. Reduction of overexposed or overdeveloped photographic negatives can be done with sodium guanidine ferricyanide. A method has been proposed for obtaining an image on a wood base by transferring a collodion positive to the blackened surface of a block. REP is a sensitized metal for making photographic copies. A new photoflash bulb enables the taking of pictures with infrared rays. Ethofoil is employed for transparent envelopes in which photographs are filed. Photographs treated with Kodak print lacquer may be washed.

Research, the Wardrobe of the Textile Industry

Needed coordination of industrial and economic research in the textile industry was the goal of a joint meeting of the Textile Foundation and the United States Institute for Textile Research. Informative labeling has gained ground in many fields. Textiles are vitally related to national defense. Seventy yards of silk are required per parachute, 19 pounds of wool for a soldier's uniform and blankets, and 17 pounds of cotton for other uniform equipment. Electrically heated flying suits have been so perfected that the U. S. Army Air Corps has ordered 12,000 of them from General Electric. Research on airplane seats and cushions is in progress. Ionization of air may be responsible for periodic troubles in the spinning and weaving rooms of certain textile centers.

Flax. The U. S. Department of Agriculture is continuing its program to encourage fiber-flax production. Investigations are being carried on by TVA in cooperation with the Georgia Agricultural Experiment Station and the Georgia School of Technology on the growing and processing of flax to make available a fiber suitable for spinning and weaving on cotton-mill machinery. A large flax decorticating plant has been erected at Helm, Calif. Six Minnesota mills have been working full time to supply the demand for tow; it is estimated that 100,000 tons of flax straw have been processed this year. Biwing, a new flax variety, will be available commercially in 1943.

GENERAL ELECTRIC CO. PHOTO

An electrically heated flying suit

Hemp and Jute. The Hard Fibers Association is assisting in developing new uses for hemp and sisal. Hemp, raffia, and other coarse shade materials are seen on lamps. An attempt is being made to revive hemp-growing in Kentucky. Brattice cloth, a nonflammable fabric generally of processed jute, used in coal mines for ventilating purposes, is manufactured by about 20 companies, which have been seeking new markets. Jute stockings for soldiers are an item on the horizon. A plant at Atmore, Ala., is to process ramie grown experimentally at Alabama's prison farm; three other states are also trying to produce the fiber.

Cotton. Over 24,000,000 cotton-spinning spindles were in place during the year. Cotton has over 1,000 known applications. The Cotton Textile Institute reported that on the summer ready-to-wear market 62 per cent of all junior dresses, 60 per cent of the lower-priced sportswear, and 50 per cent of the play clothes were of cotton. The Cotton Board of Manchester, England, has been assisting in arrangements with the National Association of Hosiery Manufacturers and other groups to make available the experience of British cotton spinners in producing hosiery of fine-gage lisle yarns. The work done on the characterization of raw cottons by chemical methods was summarized. Experimental results indicate that a mixture of sodium hypochlorite and sodium chlorite is superior to sodium or calcium hypochlorite for bleaching cotton goods, as the straight fibers are not attacked to form oxycellulose.

Cotton Fabrics. Resist cotton yarns, called "immunized", are intended to produce decorative effects in fabrics. In new-use investigation excellent progress has been made by the Cotton Research Foundation toward the objective to effect, by inexpensive means, a marked increase in the drape qualities of cotton fabrics. Increased wear performance of fabrics has been attained through selected weaving conditions. Special fabrics have been developed for effecting better adhesion where employed in making laminated materials. Elastikon is an elastic adhesive bandage whose stretch and recovery

result from special weaving of the back cloth. Cloth, it is claimed, can be manufactured without weaving if a latex, cellulose acetate, cellulose nitrate, or casein binder is sprayed on cotton after it is run through a cording machine and dropped on a moving belt. Sabel is a new type of cotton curtain fabric. Applications of metal-coated fabrics in Technicolor film settings have been discussed. Fibredown is "electro-embroidered" cloth. Stiff shirt fronts are made of a plastic.

Other Cotton Products. Octupus is a transmission belt made of impregnated duck. Cotton tire fabric infused with Bakelite laminating varnish is used on Flor-Savr heavy duty wheels. The Ordnance Department of the Army has succeeded in developing satisfactory cotton loading bags for most purposes. The U. S. Department of Agriculture has undertaken a study on the substitution of cotton as a bagging and packing material for farm products. Cotton coats to keep older sheep warm in chill weather are being used experimentally. Tubcoat for the protection of bath tubs during installation is available in two types, in flexlined burlap and flexlined cotton. Pyronized gloves are made of flameproofed cotton flannel. Moropa is a brattice cloth of cotton, treated to render it flame-, water-, and mildew-resistant. Fire-resistant cotton is being supplied in blanket-form rolls with or without asphalt-impregnated paper backing. A roof covering consists of a thin layer of cement reinforced with a cotton fabric.

Rayon. In rayon production, spinnerets of platinum-rhodium are replacing those of platinum-gold, being more resistant to corrosion and abrasion. Extensive use of rayon in decorative fabrics has influenced contemporary style trends, creating unusual textured weaves, bright and dull contrasts, and highlights that enliven soft colors. In draperies, upholstery, curtains, bedspreads, and tablecloths, rayon is providing fabrics that have been outstanding among the new offerings. Varied weaves and styles in Cordura rayon have been featured in curtains. Keynote is an all-rayon rug. A new plastic-coated pliable rayon fabric is said to be proof against stain, mildew, cracking, and chipping. American Viscose is investigating the production and use of worsted-type yarns from rayon staple fiber and rayon blended with wool and other fibers.

Wool. Well over 700,000,000 pounds of wool were consumed in 1941. Wool in which the S-S linkages have been broken by reduction, or by reduction and alkylation with alkyl monohalides, is much higher in alkali solubility than untreated wool, while wool in which the S-S cross-linkages have been replaced by new covalent cross-linkages through reduction followed by alkylation with dihalides is much lower in alkali solubility. As the susceptibility of wool to degradation by alkalies is one of its greatest disadvantages, processes of the latter type offer considerable promise in a technological way. Bromination may have value in shrink-proofing wool. Fabrics treated with a chemical and latex process, known as Kolok, are said not only to give twice the wear but also to resist shrinking and to repel moths. The addition of 1.5 per cent pentachlorodihydroxytriphenylmethanesulfonic acid to the dye bath calculated on the weight of the material to be treated is reported sufficient to protect it against damage by the clothes moth. Larv-O-Nil is a mothproofer. The development of mildew is more rapid where wool fibers are closely packed together, as in yarns and fabrics. Salicylanilide is said to be a good moldproofing agent. Mohawk has been bringing out of the pilot-plant stage a process of putting pile on carpets without spinning or weaving, used previously for automobile rugs; the new carpet is known as Moh-Nat. Wool tape is a pressure-sensitive adhesive tape with a wool-felt backing. Denicron is du Pont's artificial fiber that can be woven into a material closely resembling wool cloth. Now we come to the synthons, fibers made from organic substances which in turn have been synthesized from simple raw materials.

E. I. DU PONT DE NEMOURS & CO., INC.

Nylon tennis racket strings are unaffected by water and have other advantages.

Nylon. Late in November du Pont announced a further 25 per cent expansion of its nylon yarn capacity. Preboarding has been emphasized as imperative in the care of nylon hosiery. Some finishes used for silk hose have proved useful for nylon; the resin finishes are especially adaptable. Nylon tricot knit lingerie came on the market. Velvets that do not crush or wrinkle have been woven of nylon, but are not yet commercially available. A fabric of nylon coated with a waterproof finish is for use in rainwear, food bags, shower curtains, and aprons.

Nylon thread for home sewing was offered in 40 colors. Nylon darning thread is obtainable in 10 hosiery colors. Women's shoes with nylon uppers were marketed. Nylon came into use in the Decoma fabric for silk screen stencils. Nylon-bristled household brushes were presented to the trade. Nylon bristles brushes for some 20 industries. Gun brushes bristled with nylon are available. Nylon badminton and tennis strings are now well known. Natural gut strings for the violin class of instruments are wound with nylon filament to protect them from excessive moisture and wear. Nylon bearings for machinery are asserted to require no lubricant. Nylon is being used for wire insulation of machinery and household appliances. An investigation at the National Bureau of Standards evaluated the surface electrical properties of nylon. Nylon and rayon supplemented silk in the special paper for money and government bonds. "Tempered" nylon has been studied for use in currency and other sheet forms. Replacing worn-out paper currency costs the United States Government several million dollars a year.

Proposed and Possible Silk Substitutes. Etorayon is a resinoid fiber, a substitute for silk in knitted goods. Tensylon is a round plastic yarn, an outgrowth of Tensolite. Women's hosiery made from yarn spun from synthetic rubber is a future possibility. It is thought soybean fiber sprayed with rubber will be employed as upholstery padding in automobiles. The production of fibers from zein is expected to provide an outstanding use, but research thereon is being deferred until more satisfactory methods of curing have been developed. The possibility is foreseen that better products can be derived from protein molecules which have themselves been permanently transformed into a fibrous configuration than are at present available as protein fibers in which the molecules are not so oriented.

Vinyon. Considerable developmental work is in progress on applications of Vinyon by Carbide and Carbon Chemicals and American Viscose. Vinyon net came into use for women's shoe uppers. Artcraft Vinyon gloves were also introduced to American women; preliminary tests indicate they will outwear ordinary fabric gloves three times and ease the job of keeping white gloves clean. Vinyon felts have been utilized by the shoe and luggage trade as liners and plumpers; they have also been employed as filtering media in air-conditioning and cleaning units and as antiabrasive elements on the bottoms of lamps and table and desk ornaments. Vinyon filter fabrics have excellent mechanical strength and wearability; they are used importantly in chemical indus-

try. Among acid-resisting applications outside of filter cloths, Vinyon has been utilized effectively in the form of anode bags in electrolytic operations. Vinyon fabrics have entered the field of chemical-resistant clothing for workmen.

Other Plastic Felts. American Felt is on a production basis with materials made entirely without the use of wool, the bonding of the structure being accomplished by the use of thermoplastic fibers which under heat and pressure partially fuse and join other fibers, particularly cotton. Flexnap is a rubbershod woven felt.

Fur. Hat-Making Materials. The use of toxic mercurial compounds in fur-carroting operations has been largely eliminated from the hat industry. The Bealmac process has become prominent in non-mercurial carroting. Hatters believe more and larger rabbits can be bred here and with the U. S. Department of Agriculture are laying plans for bigger rabbit farms as sources of fur; the problem is mainly how to encourage a better market for rabbit meat. Results from experiments with kid mohair have led some manufacturers to think they have found a replacement of value for rabbit fur. Other fibers are also being studied. Aralac is the prolon fiber used in hat making; Marvlo is a cloth containing Aralac. Hat Corp. of America announced a material composed of rabbit fur, wool, and Aralac. National Dairy Products' Aratex Division is in commercial production on casein fiber going into felt hats and automotive upholstery. A factory for producing milk fiber at Taftville, Conn., has an annual capacity of about 5,000,000 pounds. It was reported that 1,000,000 pounds of casein fiber would be in felt hats during the year. Both chloric acid and peroxide carroted furs are compatible with casein fiber and wool in all proportions. Associated Fur Coat and Trimming Manufacturers is promoting the greater use of South American furs. Typhur is artificial fur made from seed heads of Typha, such as cattail.

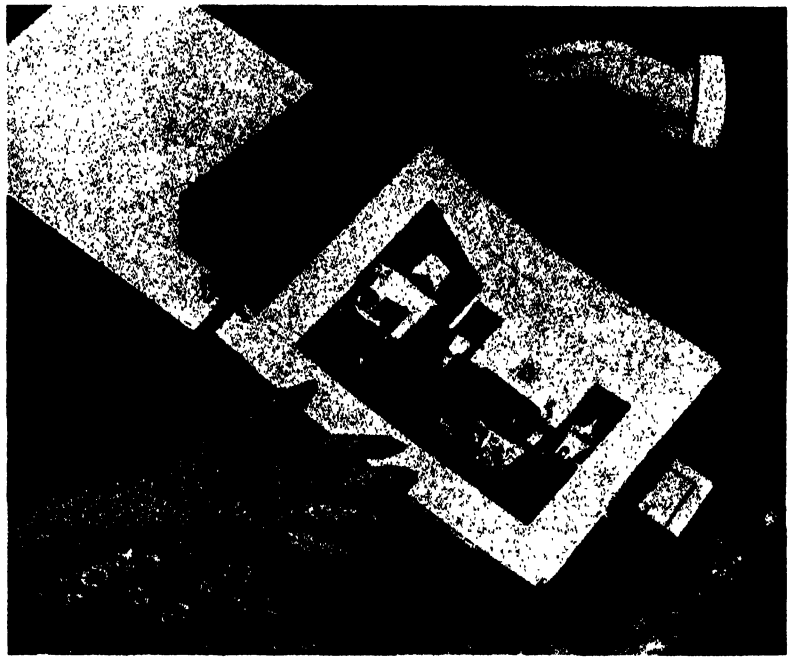
Vinyon net shoes

Dyes and Printing. The array of American dyes includes approximately 2,000 trade colors. The production in 1941 was valued at nearly $110,000,000 or about 45 per cent more than in 1940. Three new du Pont dyestuffs are Polyform Bordeaux RF, Pontachrome Fast Yellow R Conc., and Pontamine Black BCN. Calco also added to its line of dyes. Ethylsodium oxalacetate is being used for the manufacture of dyestuffs of the tartrazine type. *o*-Aminodiphenyl is utilized to produce dyes of the quinoline yellow series. The spring of 1941 was one of the most important seasons for prints. Light-colored American tung oil is utilized in a new process for cloth printing. A water-repellent back cloth treated with Zelan is applied in printing machines. Stamptex is a fugitive stamp-pad ink for identifying the production of workers in a textile mill.

UNION CARBIDE AND CARBON CORP.

Plasticized Vinylite sheeting, embossed and backed with fabric, being "pulled over" in the manufacture of a child's shoe

Textile Finishing Agents. Cationic finishing agents and their effects on direct dyestuffs have continued to receive research. Aripel F is a finish for acetate fabrics. Permel A is reported to improve feel and to minimize shrinkage of cotton and woolen goods. Wetting agents have enlarged their sphere of applications. A considerable number of wetting agents adjusted to pH 4 show germicidal properties. The manufacture of so-called self-antiseptic wearing apparel made from specially treated fabrics has had large growth. Triton NE is a high molecular weight organic alcohol wetting agent for scouring baths. The field of wetting agents and surface-active compounds in organic solutions has received little research. Dianol D is a textile detergent composed of sulfonated compounds and high molecular weight aldehyde condensates.



With the proper selection of formulas, finished starch coatings can be obtained that are substantially equal to casein coatings except in waterproofness. The chlor-gums approach casein in properties more closely than other types of starches. The propionic ester of starch can be used to give protective coatings to cloth and paper. The Mello-Sheen process is for waterproofing. Flexalyn is useful in back-sizing of rugs. Nypene emulsions have been investigated. Aerotex 140 is a synthetic resin emulsion for use in back-filling and weighting of the lower-count cotton constructions; Aerotex 301 is an emulsified resin blend for application mainly in the finishing of spun rayon. Formaset No. 8, a urea resin, and Resipon are for finishing; Paraplex RG-8 is a resin for coating. Vinylite copolymer, high molecular weight resins are applied extensively in cloth coatings. Light coatings on fabrics have been developed for shower curtains; heavier coatings have found their way into raincoats and other waterproof apparel. Combined with cloth, Vinylite sheeting, which is scuff-resistant, is utilized in children's shoes. Cements satisfactory for bonding the plasticized sheeting to leather as well as cloth have been evolved through research. It is estimated that more than 70,000,000 yards of pyroxylin-coated textiles are produced annually in this country.

A process for making cotton and other fabrics mildew-resistant depends upon forming an insoluble compound of morpholine and a salt of cadmium or copper. Research has proved that sandbag deterioration can be prevented. Fire Retardant CM is composed mainly of ammonium sulfamate with modifying agents which prevent afterglow, minimize

strength losses in treated fabrics, and permit greater penetration. Ammonium alkyl phosphates are useful in flameproofing cloth and paper. Lanthanum derivatives have been considered for use in loading silk.

The Panorama of Paints, Varnishes, and Lacquers

Exhaustive tests conducted by the National Bureau of Standards have revealed that dwelling houses are kept cooler in summer if the exteriors are treated with white or light-colored paints. During the development of paints to reflect ultra-violet light, it was noted that the reflection factors of certain paints decreased as the time of grinding in a pebble mill was increased. The decrease in reflection is accompanied by a decrease in the proportion of aggregates; the effect is greater, the smaller the difference in refractive index between the pigment and the vehicle. Recent developments in outside house paints have made possible new colors of buff and gray with the "self-cleaning" properties formerly available only in white paints. The Bureau of Standards is studying the behavior of the special paints used on exterior walls of porous masonry to keep out moisture.

Room styling with the color selector developed by du Pont. Color photographs with transparent wall areas permit study of a room in various color combinations.

Oils. Tung oil may be replaced by oiticica oil, dehydrated castor oil, glycerides of fractionally distilled fat acids (from fish oils), and segregated oils (natural oils from which the nondrying constituents have been partly removed). It has been pointed out that films from oiticica oil tend to check on aging, that those from dehydrated castor oil are soft and slow-drying, and that fish oil glycerides set up fast but remain tacky. Segregated oils in partly polymerized form (Polymerol A) have been reported to be faster drying and more waterproof than polymerized tung oil. The normal annual requirements for tung oil amount to at least 150,000,000 pounds, and the imports from China have been supplying only a twelfth of that; present domestic production takes care of hardly 2 per cent of the needs. A possible replacement for some tung oil is kukui oil, extracted from a nut growing in Hawaii. Alkyd resin vehicles are being substituted for oils and varnishes employing tung oil. Amberol 806-P, a rosin maleic type resin, is said to be useful in vehicles containing little or no tung oil.

Because of its low cost and similarity to tung oil, oiticica oil should be used increasingly by the paint industry in coming years. Zinc rather than lead driers should be employed with oiticica oil. Acetylated oiticica oil, it is claimed, will dry to a smooth, tough, glossy film in 15 minutes without the use of driers. The use of dehydrated castor oil has grown materially during the past two years. Exposure tests on varnishes indicate that dehydrated castor oil is more satisfactory blended with other oils than used alone. Castung is a modified castor drying oil. Domestic planting of flaxseed has expanded. The available supply, coupled with imports from Argentina, furnishes ample quantities of linseed oil. Special types of the oil are being processed to yield substitutes for tung oil. The Flax Institute is endeavoring to produce a seed that will afford linseed oil of higher iodine value. The U. S. Department of Agriculture has separated soybean oil into two fractions, one having much higher oil-drying power than the other. Armour announced the limited commercial production of the pentaerythritol ester of fractionated soybean fatty acids, said to be superior to linseed oil in color retention and drying speed. One company reports that it has made and sold more than 1,000,000 gallons of soybean oil paint. Several new plants for processing soybean oil to supplement the shortage of drying oils were reported under construction. Research during the past decade has improved the quality of menhaden and sardine oils. Combinations of fish oils with linseed and soybean oils are being utilized in lieu of tung oil. Suggestions have been given for the replacement of oils in varnishes by fish oils such as Falkovar and by alkyd resins modified by such oils (Falkyd resins).

Thorium naphthenate effects in linseed and soybean oils products which body in a class with dehydrated castor or oiticica oil. Cobalt, lead, and manganese dichlorostearates have the same efficiencies as the respective naphthenates as driers for oils and varnishes. It is claimed that, after treatment by sodium ethylate, vegetable oils dry to clear, tough films in but two days. The liquid esters made from succinic acid and the butene diols or from ethylene glycol and itaconic acid are types of polyesters which seem adaptable as drying oils. Petropol is being employed as a tung substitute in some products. Hercules is producing pine oil equivalent from gum turpentine.

Pigments. Witcarb is a precipitated calcium carbonate. A pigment produced by Pittsburgh Plate Glass, called Silene, is a precipitated calcium silicate. Ti-Pure R is a rutile form of titanium dioxide pigment; Ti-Cal R, a titanium pigment combined with calcium sulfate (70 per cent). A colloidal iron oxide pigment known as Mapico 297 has been described by Columbia Carbon. Zinc tetroxychromate (ZTO chromate) is a rust-inhibitive primer pigment. Hi-Way red of the lead-molybdate type is an ingredient of traffic paints. Research has been done on a new series of pigments from ammonium thiocyanate. Zinc naphthenate and zinc dichlorostearate are dispersing agents for lithopone, chrome yellow, iron blue, and (to some extent) carbon black. Carbowax compounds minimize the settling of pigments and act as binding agents in calcimines and water paints. Alumileaf is a promoter of leaf retention in ready-mixed paints. The use of *p*-coumaroneindene resin has been advised in the formulation of aluminum paints. Aquaplex S-6 alkyd resin emulsion is used in camouflage paints. There are possibilities along the line of precipitating chemical pigments upon a diatomaceous earth base.

Paints. A committee of the Federation of Paint and Varnish Production Clubs is cooperating with Army and Navy engineers on visual-deception problems. Special aircraft paints include a dull black hard to find with searchlights, a bright aluminum paint for sunny days, and a paint for hiding planes on hazy days. Experimental data indicate a superiority of well-chosen special primers over self-priming for painting such woods as Douglas fir and southern yellow pine. But they show also that primer and finish paint should be selected for use together because a primer may give good results with some finish paints and prove incompatible with others.

Anticalor and Blue-jacket are paints to stop the glare of sunlight. Checkmate is a synthetic resin liquid for use as a priming coat and for controlling grain raising. Coprene enamel is an air-dry finish with a chlorinated rubber base. Insulmat 595 consists of granulated cork in a vehicle for application on ducts and walls. Koroplate is a Koroseal paint for the protection of metals. Lay-Tite has a rubber base. Markal is paint in stick form for marking purposes. National Lead introduced a new white-lead paint in ready-to-use form. Paratex metal coating is a rubber-base preparation. Penetrol, a primer, is said to pierce rust on steel to stop further corrosion. Plitex is a canvas paint in 14 colors. Pro-Cote is applied on finished metal surfaces to protect them against corrosion in storage or transit. Reflect-O-Lite is a wall paint containing soybean protein. Tanco is a sound-deadener paint for sheet metals. Thurmalox paints are for use on hot metal surfaces. Wil-Bond is a liquid for deadening gloss.

A hot-dip phosphate solution treatment is utilized in improving the protective value of paints for steel. Various types of wax-fortified paints provide finishes said to be hard to mar and easy to clean. Alkyd emulsion paints have many uses. The application of germicidal paints has been proposed as a helpful factor in reducing atmospheric microbial contamination, but the addition of antiseptics in practicable amounts has met with little success. Mildew infection of white paints can be inhibited by incorporating large proportions of zinc oxide; 1 per cent sodium pentachlorophenate gives almost complete control of mold growth. Mert ZT is a mold, mildew, and algae preventive for employment in paints. In paintings, it has been found easier to prevent mold by grinding fungicides into artists' paints than to destroy it after well established. Ridsmel is a paint deodorant. Five million gallons of paint are used annually in traffic marking. The U. S. Department of Agriculture announced a traffic pavement paint using soybean oil instead of tung oil. Imbedding glass beads in paint, besides giving luminous quality, tends to prolong the life of markings from eight months to a year. No-Wash is a paint remover.

Varnishes. The American Gum Importers Association is sustaining research on natural resins. Congo and Manila resins possess possibilities through esterification. Advagum is a terpene plasticized polymer. A commercially available diterpene fraction, which dries in 15 hours in films in the presence of driers, may be used to replace part of either the rosin or oil of varnishes. Belro resin is obtained during refining of Hercules FF rosin. Pentalyn resins produce rapid drying. Esters formed from pentaerythritol and rosin acids yield varnishes of better color and baking and ultraviolet light stability than those from ester gum. Maleic-rosin-glycerol resins make good furniture finishing varnishes. Hercolyn is used in furniture lacquers to prevent cold-checking of the film. In sparkproof truck wheels, colloidal graphite mixed with varnish and fabric provides a conductor in the laminated rim. Ire-O-Volt is an electrical insulating tubing treated with an oil-base varnish. Harvel 612-C is an insulating varnish for use with windings that carry glass-fiber and asbestos insulation, consisting of a phenolic-resin base made from cashewnut-shell extract. Master Shellac Fortifier is said to prevent abrasion in varnished floors.

BELL TELEPHONE LABORATORIES

Determining the corrosion-resisting properties of paint by measuring the electrochemical potentials

Synthetic Resin Coatings. Cyclic ketones, derivatives of isophorone of high molecular weight, are being used as plasticizers for coatings. *N*-*n*-butyl sulfonamide is a plasticizer for cellulose acetate and nitrate. *N*-formyl-aminodiphenyl improves nitrocellulose compositions. New synthetic resin-base machinery finishes are said to possess greater durability than oil- or varnish-type enamels. As to coatings for use on electroplated ware, modified nitrocellulose lacquers have good adhesion, toughness, and abrasion resistance, but lose adherence on aging. Phenolic-type resins have the good characteristics of nitrocellulose lacquers and chemical resistance in addition but tend to turn yellow on aging. Alkyd resins have many good characteristics, including gloss retention. Urea and melamine resins, which are converted into hard, chemical- and oil-resisting films by heat, are quite useful. Uformites F-226-E and MM-58 are urea and melamine formaldehyde resins for coatings. A line of baking enamels that can be applied on plastics as well as metal parts has been announced by Duralac. Coatings of Vinylite on steel have replaced corrosion-resistant metals for many purposes, such as in refrigerator trays and washing-machine parts.

Spraying, Drying, and Baking. If Boothcote is sprayed on walls before painting operations are begun, the accumulation of paint spray may be stripped off in sheets. Bricate is used on the wet parts of spray booths; Linatol sticks on the dry walls of booths but can be washed off with a hose. The main saving with infrared heating is in time; the number of parts or bodies in process are reduced by short finishing cycles. Boston Wire Stitcher has speeded with infrared lamps the baking of finishes on wire-stapling products; Acme Chair now bakes finishes on metal folding chairs this way in 12 minutes instead of an hour by former practice. Nalco inside-silvered carbon

BELL TELEPHONE LABORATORIES

filament lamps are for employment in drying and baking.

The Status of Leather Manufacture

The War Department issued a manual on the classification, processing, and inspection of leather and leather equipment. The National Bureau of Standards devised a method for measuring the permeability of leather to water vapor. An improved dressing material, or "dubbin", developed by the Quartermaster Corps in cooperation with the Bureau of Standards, is expected to improve the serviceability and comfort of Army shoes. The C. W. S. has formulated a paste decontaminating agent for protecting shoes from the effects of mustard gas. The fungistatic action of leather insoles containing rubber impregnated with hydroxyquinoline, *p*-chloro-*m*-xylenol, and chlorothymol has been studied.

Calcium hydrosulfide, an unhairing agent, is available commercially in 30 per cent solution; Depilin-X is another dehairer. The cultivation of sumac and canaigre is being investigated, with emphasis upon the determination of growth conditions most favorable for tannin production. Research, however, has enabled several tanners to develop blends which effect satisfactory operations without the use of sumac and valonia. New-type tanning extracts are said to make kid shoes more resistant to scuffing. Pecan shells are thought to warrant consideration as a commercial source of tannin. Sulfite salts have been found effective in retarding discoloration and loss of tannin in aqueous solutions of tannic acid. Alkyd resins, modified with nondrying oils, are used on leather in conjunction with nitrocellulose; acrylic ester polymers have found application in the form of water dispersions. Tetraalkyl ammonium hydroxide dissolves keratins in the cold.

A hidebound belief is that it is not possible to produce a plastic with the same architectural pattern as leather. But it should be possible, according to experts, to make a form of plastic having means of ventilation, for satisfactory use in shoes.

Roll of Results in Rubber Research

The yearly American needs of rubber have increased from 1 to 10.5 pounds per person in the past 30 years. About 80 per cent of the rubber consumed normally is used in the automotive industry: the modern automobile contains about 200 different parts made wholly or in considerable part of rubber; including the tires and tubes, the weight of these materials is about 145 pounds per car. Reclaimed rubber production has continued at practical capacity. Dispersite is a water-dispersion of reclaimed rubber.

Rubber Production. The United States and Mexican Departments of Agriculture concluded an agreement for rubber-producing experiments in Mexico. The Governments of the United States and Haiti announced agreement on a program whose central feature is a plan of rubber development. The rubber-plantation industry in the Western Hemisphere is on the way to progress. Surveys of equatorial America's potential rubber-producing areas have done much more than show that rubber can be cultivated there; by means of wide plant collection and assembling at strategic points, production actually has been started. It takes seven years at the shortest to get a rubber plantation to the tapping stage. The U. S. Department of Agriculture approved a $25,000,000 project to plant guayule in the Southwest. Scientists at California Institute of Technology are experimenting with the guayule plant as a source of rubber. Preparation of rubber from guayule grown in Salinas Valley is directed by American Rubber Producers; the output is being used as a mixer and sealer because of its adhesive qualities.

Rubber Processing. Calcium nitrate has been suggested as a coagulant in latex dipping processes. 2-Nitro-2-methyl-1-propanol is a heat sensitizer for latex. Diazoaminobenzene (Unicel) is employed as a blowing agent in producing rubber sponge. Sheet rubber in continuous lengths is being made from latex. A machine which changes rubber from raw material to finished product is being used to speed up production of self-sealing fuel-tank linings. Rubber processing may profit by utilizing methods of injection molding developed by the plastics industry. Pellet rubber is said to facilitate mixing. Ethyl xanthic acid anhydride has been put forward as a plasticizing agent for rubber.

Vulcanization and Compounding. The crystallization of vulcanized rubber has been investigated at the National Bureau of Standards. In cold climates some rubber products have been observed to undergo slowly an increase in rigidity and permanent set; the crystallization of unstretched specimens of vulcanized rubber of low sulfur content offers a basis for the explanation of such phenomena. 6,6′-Bis-(2,2,4-trimethyl-1,2-dihydroquinoline) has been suggested as an antioxidant for low-sulfur-content rubber articles. Di-(2-methyl-4-isopropylphenol)-sulfide has been proposed as an antioxidant for white rubber goods. Du Pont 2-MT is an all-purpose vulcanization accelerator. Monsanto 2-mercapto-4-phenylbenzothiazole is another accelerator. 1-Nitro-2-methylpropane is an antigel or vulcanization inhibitor in cements containing ultra-accelerators, but is reported inferior to 1-chloro-1-nitropropane. Hydrated alumina is being used in place of zinc oxide as a reinforcing pigment in compounding. The properties of Naftolen from a compounding standpoint were described. Duramin is a combination of age resisters, stemming from nonaccelerating aldehyde-amine condensation products, utilized in the Goodyear Silvertown tire line and certain types of mechanical goods. A chlorinated dihydroxydiphenylmethane is employed as an antiseptic in rubber.

Tire Technology. Leading tire manufacturers have been eliminating truck tire wrapping and all nonessential tire lines so as to simplify production and distribution in aiding defense. Rubber for civilian use must indeed be stretched. Major tire companies are planning to establish retreading stations on a national scale. An investigation of the requirements for extra performance in high-speed, heavy-duty pneumatic tires has resulted in a method of increasing cotton cord strength about one third and also trebling its flex life. A cord of even better characteristics is anticipated by Cotton Research Foundation. More than a bale-and-a-half of cotton goes into each 36.00-40 Firestone 34-ply tire. A new rayon cord tire for passenger car service has been introduced

GOODYEAR FROM OEM

Lining for a bullet-seal aircraft tank being inspected

by U. S. Rubber. Light tires of synthetic rubber, strengthened by woven glass cord, are being studied. General Purpose Compound of U. S. Rubber, because of its low rolling resistance in tires, is claimed to cut the cost of truck operation. A product that practically prevents cracking of tread and side wall rubber has been developed by Firestone. Goodyear introduced a hydrotire and a filling process for increasing weight and traction by the use of water. Automotive static neutralizer is a fine powder that floats in the air inside an inner tube; industrial tires are made that conduct static electricity to the ground; rubber products which are conductive have also been developed for special service conditions, such as for airplane tire treads, airplane wing de-icers, gasoline hose nozzles, floorings, washing-machine belts, and hospital operating-room equipment.

Other Rubber Products. Rubber tank treads, self-sealing hose, bullet-sealing tires, flotation gear for disabled land planes alighting on water, and surgical pads were exhibited. U. S. Rubber developed rubber springs for mine cars. Falk Airflex is a rubber air-cushioned coupling to reduce the transmission of vibrations of pulsating machinery. Hevaloid is a transmission belt consisting of cotton impregnated with latex; Homocord is a new type of rubber conveyor belt. Teneplate is a molding medium, a thin aluminum foil covered with a wax-rubber plastic, used in electrotyping. Filtomesh is a rubber-mesh material and Torflex is a rubber-backed bearing. Rai-Seal is a quick-hardening rubber joint-sealing material and Sealz is a thermoplastic rubber compound for sealing purposes. Rubber-base liquids are available for application to pulley faces. Royal insulation board is a cellular rubber product carrying nitrogen in a matrix. Velvetex is a base of rubber applied to rugs by vulcanization to provide a cushioned foundation. A golf ball with an oil center is said to be livelier and tougher. Angleworms have been molded of rubber for fish lures; they are filled with a paste flavored with roe.

Cyclized and Chlorinated Derivatives. The so-called synthetic-balata mix D-30-T14 for high Pliolite-low rubber ratio is employed as a golf ball cover stock; another use is in protective helmets. Other applications of Pliolite-rubber mixtures are in coated fabrics and wire insulation. Plioform is being utilized in fuel tanks of airplanes and combat vehicles. Pliofilm gas-decontamination suits and baby parachutes for naval aircraft flares were shown; Pedettes are Pliofilm foot coverings. Early in 1942 Hercules will increase by nearly 50 per cent its production of Parlon chlorinated rubber. The first of a series of full-scale Raolin chlorinated rubber manufacturing units was placed in operation; the employment of Raolin-coated paper in closure linings was described.

Synthetic Rubbers. So far 29 varieties of synthetic rubber have been studied. Current synthetic production of general purpose rubber is equivalent to about 3 per cent of the crude rubber consumption; the output in 1942 should be at least 15 per cent of normal requirements. Factories arranged for and building are capable of producing at the rate of 40,000 tons of synthetic rubber by the end of 1942. Expansion of the plants being erected by four American manufacturers in cooperation with the Federal Loan Agency will provide another 40,000 tons of annual capacity. The following table shows American production of synthetic rubbers in recent years (in tons):

Year	Neoprene Types	Butadiene Types	Polysulfide Products
1939	1,750	None	500
1940	2,500	60	700
1941	9,000	4,000	1,400

In March Carbide and Carbon Chemicals shipped its first tank car of butadiene. Later it was announced that another larger butadiene plant would be constructed. Elastomers produced from Carbide and Carbon Chemicals dichloroethyl formal are employed extensively in self-sealing linings for fuel tanks and hose on military aircraft. Duraplex and dibutyl sebacate have found application as processing aids for synthetic rubbers; butyl phthalate is being used as a synthetic rubber softening agent; Resinous Products and Chemical Plasticizer 30 is interesterified phthalic anhydride and butyl and capryl alcohols.

Neoprene. Neoprene is valuable in defense in many ways and in April a million pounds were allocated to about 250 companies for use in such work. In 1941 the automobile and aircraft industries have used well over 100 different neoprene parts. Construction was begun on a new neoprene plant at Louisville, Ky., with a capacity of 10,000 tons a year. Ammonia has practically no effect on neoprene; dry sulfur dioxide stiffens the surface and, after continued exposure over long periods, stiffens neoprene throughout. Methyl chloride swells most neoprene compounds, but special products have given satisfactory service. Freon-type refrigerants swell and dissolve rubber but have practically no effect on neoprene products. Neoprene FR retains rubberlike properties at low temperatures.

A vibration- and shock-absorbing mounting offered for aircraft equipment applications is made of two stainless steel tubes separated by and mechanically bonded to a wall of neoprene. Neoprene is being employed in flexible bearings. A threadless pipe coupling has a neoprene gasket for sealing. P. A. W. sealing tape is a neoprene-faced cotton fabric for gasketing riveted seams in marine construction. Neoprene is said to give longer life than rubber in typewriter feed rolls. Par-Grip boots use neoprene. Dry-cleanable dress shields have been made with neoprene lining coats.

Ameripol. Goodrich is expanding Ameripol output from 6 to 18 tons a day. In its resistance to aging Ameripol is described as superior to natural rubber; its resistance to acids and alkalies is about the same. Special cements have been developed which enable vulcanization and adhesion to metals, provided the latter can be suitably roughened. Ameripol has uses involving resistance to petroleum products, such as in molded and lathe-cut

PRELIMINARY PROGRAM

Memphis Meeting, American Chemical Society

April 20 to 24, 1942

General Chairman Bowld

Vice Chairman Rogers

Vice Chairman Nash

Honorary Chairman Coulter

BLANK AND STOLLER

Vice Chairman Barrow

Vice Chairman Bowers

General Program

Registration and most divisional meetings will be held in the Municipal Auditorium. A few sessions will be scheduled for the Sunday School Building of the First Methodist Church, one block from the Auditorium. The Division of Rubber Chemistry will meet in the Hotel Claridge.

Sunday, April 19

2:00 to 9:00 P. M.—Registration, Municipal Auditorium.
8:00 to 10:00 P. M.—Social hour.

Monday, April 20

8:00 A. M. to 6:00 P. M.—Registration.
9:30 A. M.—Council meeting.
12:15 P. M.—Group luncheons.
2:00 P. M.—General meeting.
6:30 P. M.—Group dinners.
8:15 P. M.—Entertainment.

Tuesday, April 21

7:30 A. M.—Group breakfasts.
8:00 A. M. to 6:00 P. M.—Registration.
9:00 A. M.—Divisional meetings.
9:00 A. M.—Plant trips.
12:15 P. M.—Group luncheons.
2:00 P. M.—Divisional meetings.
2:00 P. M.—Plant trips.
6:30 P. M.—Group dinners.
6:30 P. M.—Barbecue and entertainment.

Wednesday, April 22

7:30 A. M.—Group breakfasts.
8:00 A. M. to 6:00 P. M.—Registration.
9:00 A. M.—Divisional meetings.
9:00 A. M.—Plant trips.
12:15 P. M.—Group luncheons.
2:00 P. M.—Divisional meetings.
2:00 P. M.—Plant trips.
7:00 P. M.—Subscription dinner.
9:30 P. M.—Complimentary dance.

Thursday, April 23

7:30 A. M.—Group breakfasts.
8:00 A. M. to 6:00 P. M.—Registration.
9:00 A. M.—Divisional meetings.
9:00 A. M.—Plant trips.
12:15 P. M.—Group luncheons.
1:30 P. M.—Golf tournament.
2:00 P. M.—Divisional meetings.
2:00 P. M.—Plant trips.
6:30 P. M.—Group dinners.

Friday, April 24

7:30 A. M.—Group breakfasts.
8:00 A. M. to 12:00 M.—Registration.
9:00 A. M.—Divisional meetings.
9:00 A. M.—Plant trips.
12:15 P. M.—Group luncheons.
2:00 P. M.—Divisional meetings.

Local Committee Chairmen

HONORARY CHAIRMAN—Victor A. Coulter.
GENERAL CHAIRMAN—William F. Bowld, Buckeye Cotton Oil Co.
VICE CHAIRMAN—E. R. Barrow.
FINANCE—E. R. Barrow.
PRINTING AND SIGNS—T. L. Rettger.
PUBLICITY AND PRESS—R. F. Gould.
REGISTRATION—J. N. Pless.
VICE CHAIRMAN—P. D. Bowers.
INFORMATION—Jeff M. Hart, Jr.
LADIES' ENTERTAINMENT—G. N. Ferguson and Mrs. K. H. Hicks.
STUDENT CHEMISTS—G. H. Hayden.
WOMEN CHEMISTS—Mrs. K. H. Hicks.
VICE CHAIRMAN—T. P. Nash, Jr.
ENTERTAINMENT—E. E. Hembree.
GOLF—J. R. Meadow.
GROUP MEALS—E. F. Williams, University of Tennessee, Memphis.
VICE CHAIRMAN—L. N. Rogers.
ACCOMMODATIONS—E. R. Stevens.
MEETING ROOMS—J. D. Atkinson, Jr., Buckeye Cotton Oil Co.
TRANSPORTATION AND TRIPS—C. B. Weiss.

Ladies' Program

Ladies' headquarters will be maintained in the Hotel Peabody.

Sunday, April 19

2:00 to 9:00 P. M.—Registration, Municipal Auditorium.
8:00 to 10:00 P. M.—Social hour.

Monday, April 20

8:00 A. M. to 6:00 P. M.—Registration.
2:00 P. M.—General meeting.
3:00 to 5:00 P. M.—Complimentary tea and reception.
8:15 P. M.—Entertainment.

Tuesday, April 21

10:00 A. M. to 4:00 P. M.—Sightseeing tour of the Memphis park system, the Brooks Memorial Art Gallery, and the Pink Palace.
6:30 P. M.—Barbecue and entertainment.

Wednesday, April 22

10:00 A. M. to 4:00 P. M.—Garden tours encompassing the finer private iris and peony gardens. Supplementary plant visits will be arranged.
7:00 P. M.—Subscription dinner.
9:30 P. M.—Complimentary dance.

Thursday, April 23

9:00 A. M. to 4:00 P. M.—Annual Holly Springs Pilgrimage.

Registration

The Registration Headquarters of the meeting will open at 2:00 P. M. Sunday in the Main Street (east) corridor of the Municipal Auditorium, and will continue there throughout the meeting. The registration fee, required by vote of the Council to help carry local expenses, has been fixed at $3.00 for members and visitors other than American nonmember chemists and chemical engineers; $8.00 for American nonmember chemists and chemical engineers. All members and visitors must register. Admission to meetings will be restricted to those wearing official badges of this meeting.

Society Regulations Governing Registration

BYLAW 2. (*a*) Attendance at meetings of the SOCIETY is limited to registered persons.

(*b*) All persons in registering at meetings of the SOCIETY shall state whether or not they are members of the SOCIETY and, if not, whether they are chemists or chemical engineers.

(*c*) American chemists or chemical engineers, nonmembers of the SOCIETY, attending meetings of the SOCIETY, shall assist in the support of the facilities which they enjoy by paying a higher registration fee than members. This differential at general meetings shall be $5.00 higher than the fee charged members; while at regional and divisional meetings it shall be at least twice the regular fee adopted. They shall be furnished with a special nonmember badge to differentiate them from members of the SOCIETY and from foreign and nonchemist guests. The differential charged shall not apply to regularly matriculated students majoring in chemistry or chemical engineering at any college or university.

(*d*) Meetings are normally open to all registrants, but any session may be closed to nonmembers of the SOCIETY by order of the President.

NOTE. Corporation members have the right to designate *one representative only* with membership privileges at each meeting. If a *corporation member* sends a substitute for the delegate of record, the Secretary's office should be informed by mail. In registering, such a representative should sign the corporation name, per his own as representative.

Associate members of local sections and of divisions are not members of the Society, and have no Society privileges; if chemists or chemical engineers, their registration fee is $8.00. All visitors, including children, regardless of age, who participate in any trips, lunches, or other activities provided on either the men's or women's program, regardless of whether they are free or paid events, must pay the visitors' registration fee, $3.00, and wear the appropriate badge.

Hotels

Hotel Peabody, Union Avenue between Second and Third Streets, has been designated as headquarters for the meeting.

Hotel Claridge, 109 North Main St., will be headquarters for the Division of Rubber Chemistry.

Requests for reservations should be sent at once to the A. C. S. Hotel Committee, Memphis Chamber of Commerce, Hotel Peabody, Memphis, Tenn. Please fill out the hotel reservation application in this CHEMICAL AND ENGINEERING NEWS, page 36, giving all the data requested.

Because of the present large demand for hotel rooms in Memphis, it is imperative that reservations be made at the earliest possible date. For the same reason, double occupancy of rooms is desirable. Since defense activities are making a heavy call on Memphis hotels, the convenience of a single room should be sacrificed as a patriotic contribution. It is in this spirit that the Hotel Committee asks that (1) hotel reservations be made early, giving the dates of arrival and departure, and (2) members arrange to share double rooms.

Rooms for students will be available at 75 cents per day and up.

Railroad Rates

Owing to the general reduction of railroad rates, railroads have discontinued the granting of reduced fares to conventions. However, there are substantial reductions in special 15, 30, and 60-day round-trip fares from many cities. Consult your local ticket agent.

By April there may be a shortage of Pullman cars for movement of civilian traffic. Therefore, *early reservation of space is recommended.*

Addresses of Divisional Secretaries

AGRICULTURAL AND FOOD CHEMISTRY. Roger H. Lueck, Research Department, American Can Co., Maywood, Ill.

ANALYTICAL AND MICRO CHEMISTRY. Francis W. Power, S.J., Fordham University, New York, N. Y.

BIOLOGICAL CHEMISTRY. Erwin Brand, 630 West 168th St., New York, N. Y.

CELLULOSE CHEMISTRY. Charles R. Fordyce, 275 Maplewood Drive, Rochester, N. Y.

CHEMICAL EDUCATION. Paul H. Fall, Hiram College, Hiram, Ohio.

COLLOID CHEMISTRY. J. W. McBain, 571 Foothill, Stanford University, Calif.

GAS AND FUEL CHEMISTRY. G. R. Yohe, State Geological Survey, Urbana, Ill.

HISTORY OF CHEMISTRY. Ralph E. Oesper, Department of Chemistry, University of Cincinnati, Cincinnati, Ohio.

INDUSTRIAL AND ENGINEERING CHEMISTRY. Whitney Weinrich, Gulf Research & Development Co., Box 2038, Pittsburgh, Penna.

MEDICINAL CHEMISTRY. John H. Speer, 4737 Ravenswood Ave., Chicago, Ill.

ORGANIC CHEMISTRY. Arthur C. Cope, Department of Chemistry, Columbia University, New York, N. Y.

PAINT, VARNISH, AND PLASTICS CHEMISTRY. Adolf C. Elm, New Jersey Zinc Co., Box 263, Palmerton, Penna.

PETROLEUM CHEMISTRY. Cary R. Wagner, Pure Oil Co., 35 East Wacker Drive, Chicago, Ill.

PHYSICAL AND INORGANIC CHEMISTRY. Oscar K. Rice, Department of Chemistry, University of North Carolina, Chapel Hill, N. C.

RUBBER CHEMISTRY. Howard I. Cramer, Sharples Chemicals, Inc., 23rd and Westmoreland Streets, Philadelphia, Penna.

SUGAR CHEMISTRY AND TECHNOLOGY. E. Whitman Rice, National Sugar Refining Co., 129 Front St., New York, N. Y.

WATER, SEWAGE, AND SANITATION CHEMISTRY. H. Gladys Swope, North Shore Sanitary District, Dahringer Road, Waukegan, Ill.

Official Hotels

HOTEL	RATES		
	For One Person*	For Two Persons	Suites
Peabody	$3.00 to 6.00	$4.00 to 10.00	$14.00 to 25.00
Claridge	3.00 to 5.00	4.00 to 8.00	.....
Ambassador	2.25 to 3.00	2.25 to 3.00	.....
Blackstone	1.50 to 2.50	2.50 to 4.00	.....
Chisca	1.50 to 4.50	3.50 to 5.00	7.00
De Voy	2.00 to 5.00	3.50 to 5.00	.....
Gayoso	2.50 to 5.00	3.50 to 6.00	.....
Wm. Len	2.50 to 3.50	3.50 to 4.00	6.50

* Limited in number. Double occupancy is desirable.

Papers for the Meeting

Titles for papers should be sent to the secretary of the appropriate division and *not to the Secretary of the Society. Titles to appear on the final program and abstracts, or complete papers where required, must be in the hands of the division secretaries not later than February 16.*

Society Regulations Governing Papers

BYLAW 3. (*a*) Papers by American chemists or chemical engineers not members of the SOCIETY shall not appear on the programs of general, divisional, or regional meetings of the SOCIETY unless they be joint papers with SOCIETY members.

(*b*) All papers presented before general, divisional, regional, group, local section, or other meetings are the property of the SOCIETY, to be published in the journals of the SOCIETY or released by the appropriate editor if not retained for such publication.

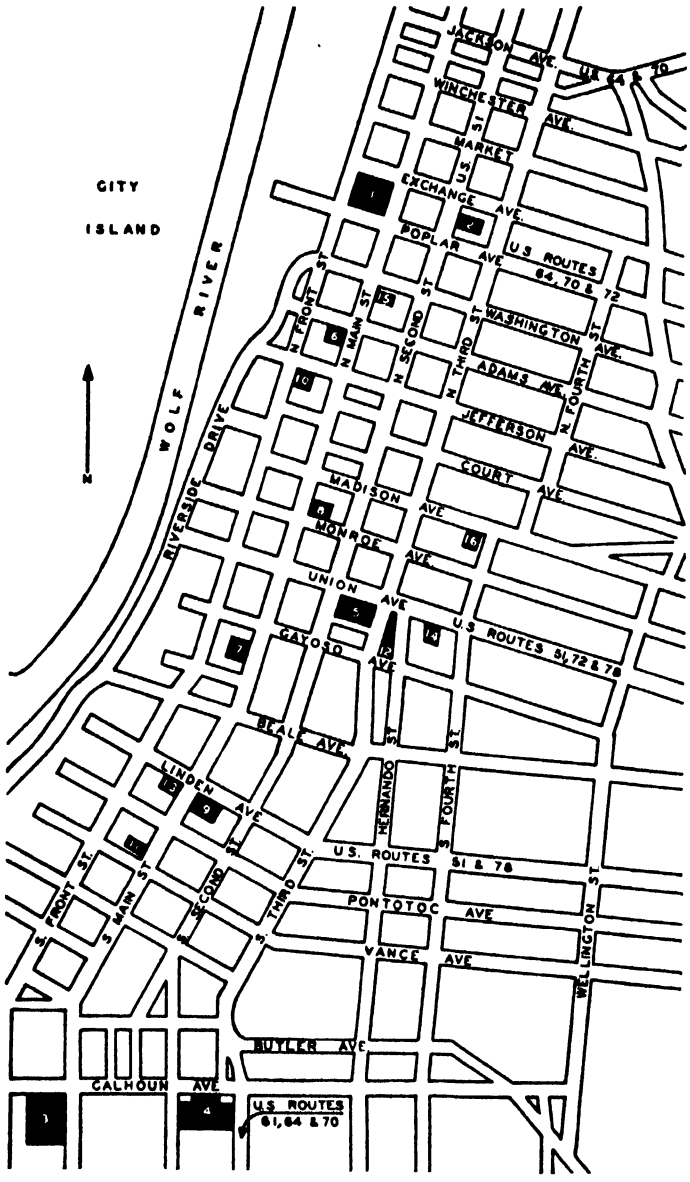
(*c*) The SOCIETY is not responsible for statements and opinions advanced by individuals in papers or discussions before its meetings.

(*d*) Any paper, although announced in the final program, may be excluded at any time prior to delivery by order of the President.

The Board of Directors has voted the following regulations (R-55) governing papers to be presented before general, divisional, regional, or group meetings, supplementing Bylaw 3:

(*a*) Authorship of papers shall be accredited only to individuals and not to companies or laboratories.

(*b*) No paper may be presented which has been offered for publication elsewhere.



(*c*) No paper, no matter how important, may be presented, the title of which does not appear on the final program.

(*d*) If a paper is declined by any division of the SOCIETY, the secretary of that division is instructed to notify the secretary of any other division to which it is likely to be offered.

Priority is based solely upon the date of receipt of the *complete* paper deposited for publication with the secretary of the division or the appropriate editor.

The Council has empowered officers of divisions to request any paper in advance, so that it may be passed upon and an indication made to the author as to whether he is to read the entire paper or to abstract it in order to give time for discussion.

No paper may be presented at the meeting, title for which is not printed in the final program.

"By title" should be placed on the announcement of any paper when the author is to be absent, so that members may understand in advance that the paper will not be read. All such papers should be placed at the end of the program.

Authors should state whether or not they will require a lantern.

Divisional Requirements

The Division of Agricultural and Food Chemistry requires that those wishing to present papers at the meeting submit, in duplicate, a 200-word abstract together with information regarding the time required for presentation of the paper. Abstracts should be accompanied by the name and address of the author (or authors), the name of the laboratory in which the work was done, and information concerning the projection equipment required, if any. Abstracts must be in the hands of the secretary of the division not later than February 16. Authors will kindly notify him if they plan to present papers before other divisions. Planographed abstracts of the papers will be sent to all members of the division about two weeks prior to the meeting.

The Division of Analytical and Micro Chemistry requires that authors who plan to present papers before the division return to the secretary of the division not later than February 16 a form which lists the title of the paper, name and address of the author (or authors), name of the laboratory in which the work was done, time needed for informal presentation, projection equipment required, a 200- to 250-word abstract, and one copy of the complete paper.

The Division of Biological Chemistry requires by February 16 a 200-word abstract *in duplicate* and information regarding the time required for presentation of the paper. If deemed necessary, the division may request a 1,000-word abstract or the complete manuscript. Abstracts will be sent to members of the division prior to the meeting.

The Division of Cellulose Chemistry requires that an abstract not to exceed 200 words and two copies of the manuscript

be in the hands of the secretary of the division on or before February 16. Two copies of the manuscript are necessary in order that the paper may be considered by the review committee within the time remaining between February 16 and the date on which the final program is submitted for publication.

The Division of Chemical Education requires by February 16 a 200-word abstract, the complete paper, and information on the time needed for presentation. Abstracts of all papers on the divisional program will be sent to members of the division in advance of the meeting.

The Division of Colloid Chemistry requires not later than February 16 three copies of an abstract of about 200 words. The complete manuscript should be handed to the secretary of the division after the paper is presented.

The Division of Gas and Fuel Chemistry requires not later than February 16 a 200-word abstract, the complete paper, and an estimate of the time needed for presentation.

The Division of the History of Chemistry requires that its secretary receive not later than February 16 the name of the author (or authors) with address and official connection at the time of the work reported, an abstract not to exceed 250 words, and information regarding the time required to present the paper and need for a lantern. The complete manuscript should not be sent to the secretary of the division. After the paper has been read the manuscript, *prepared for publication*, should be submitted to the Editor of the *Journal of Chemical Education*.

The Division of Industrial and Engineering Chemistry requires the complete paper for submission to reviewers. It must be received by February 16 and accompanied by a 200-word abstract, the name of the laboratory in which the work was done, and information regarding the time requirement and need for a lantern. The paper will be placed upon the final program only after receiving a favorable report from the reviewers.

The Division of Medicinal Chemistry requires that authors submit by February 16 the complete manuscript, three copies of a 200-word abstract, an estimate of the time needed for presentation, and the name of the laboratory in which the work was done. The executive committee has full authority to accept or reject papers.

The Division of Organic Chemistry requires (1) a 200-word abstract, which must be typed in the space allotted on a form supplied by the secretary of the division, and (2) a more extensive abstract of at least 1,000 words, or a copy of the manuscript in form for publication. Both must reach the divisional secretary by February 16, after which no additions, changes, or withdrawals of papers can be made.

The Division of Paint, Varnish, and Plastics Chemistry requires that those wishing to present papers at the meeting send the title and two copies of an abstract to the secretary of the division before February 16. Two copies of the complete paper should be sent to the secretary before March 1.

The Division of Petroleum Chemistry requires that members wishing to present papers submit before February 16 three copies of a 100-word abstract and three copies of a 1,000-word abstract; before March 2, three copies of the complete paper must be in the hands of the secretary of the division. If the final paper is submitted in triplicate by February 16, the 1,000-word abstract is unnecessary.

The Division of Physical and Inorganic Chemistry requires that titles for papers be accompanied by an abstract of approximately 100 words for distribution to the members of the division, and the complete manuscript or another abstract of 1,000 words. The short abstracts should follow the form used in the sets of planographed abstracts for previous meetings; please refer to a recent copy. The manuscript or long abstract will be returned only upon request made at time of transmittal. All material must reach the secretary of the division before February 16, and no alterations or additions may be made thereafter. No title will be placed upon the program unless an author expects to be present to give the paper.

The Division of Rubber Chemistry requires by February 16 three copies of an abstract of 200 to 250 words, an estimate of the time needed for presentation, and the name of the laboratory in which the work was done. The complete manuscript (three copies) must be submitted to the secretary of the division on or prior to the date of presentation.

The Division of Sugar Chemistry and Technology requires a 100- to 200-word abstract, to be submitted not later than February 16.

The Division of Water, Sewage, and Sanitation Chemistry requires by February 16 five copies of a 250-word abstract, and information regarding time required and the laboratory from which the paper comes. The abstracts will be sent to members of the division prior to the meeting.

Publication of Papers

BYLAW 3 (*b*). All papers presented before general, divisional, regional, group, local section, or other meetings are the property of the SOCIETY, to be published in the journals of the SOCIETY or released by the appropriate editor if not retained for such publication.

If release is desired, address the editor

Divisional Programs

DIVISION	NUMBER OF SESSIONS	PROGRAMS
Agricultural and Food Chemistry	6	Vitamins (with Division of Biological Chemistry) Tuesday. Agricultural Products of the South (with Division of Industrial and Engineering Chemistry). Starch (with Division of Sugar Chemistry and Technology). Trace Elements in Nutrition (with Division of Biological Chemistry). General.
Analytical and Micro Chemistry	4	Analytical Methods in Organic Chemistry (with Division of Organic Chemistry). General.
Biological Chemistry	7	Vitamins (with Division of Agricultural and Food Chemistry) Tuesday. Trace Elements in Nutrition (with Division of Agricultural and Food Chemistry). General.
Cellulose Chemistry	4	General.
Chemical Education	4	The Problem of Teaching Chemistry. General.
Colloid Chemistry	2	General.
Gas and Fuel Chemistry	2	General.
History of Chemistry	2	History of the Development of Chemistry in the Southern States, Harrison Hale, Chairman. General: Biographical and Historical.
Industrial and Engineering Chemistry	3	Agricultural Products of the South (with Division of Agricultural and Food Chemistry). General.
Medicinal Chemistry	3	Recent Progress in Medicinal Chemistry. General.
Organic Chemistry	6	Analytical Methods in Organic Chemistry (with Division of Analytical and Micro Chemistry). General.
Paint, Varnish, and Plastics Chemistry	3	General.
Petroleum Chemistry	4	General.
Physical and Inorganic Chemistry	12	Rare Earths. The Hydrogen Bond. General.
Rubber Chemistry	3	General.
Sugar Chemistry and Technology	4	Starch (with Division of Agricultural and Food Chemistry). General.
Water, Sewage, and Sanitation Chemistry	2	General.

of the appropriate journal—i. e., H. E. Howe, A. B. Lamb, S. C. Lind, N. W. Rakestraw, or W. Albert Noyes, Jr. The editors will act promptly on any release requested when the paper is in their hands.

Abstracts of Papers

Abstracts should accompany all titles when sent to the secretaries of the various divisions. Many of the secretaries complain that they are caused embarrassment through the nonarrival or late arrival of both titles and abstracts. Members are urged to attend to this matter in order to facilitate proper cooperation with the News Service and enable the secretaries to have sets of abstracts ready in advance of the meeting.

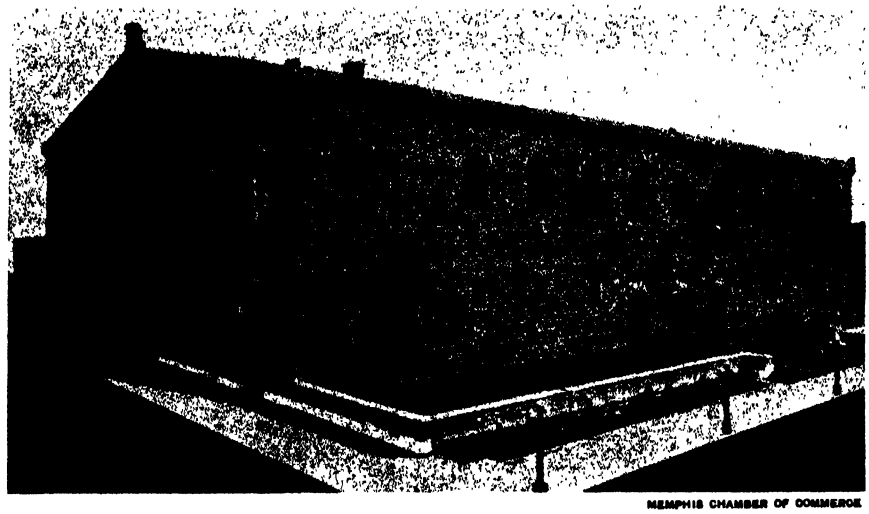
Sets of Abstracts

Frequently there is a considerable period between the presentation of a paper and its publication, and in such cases the abstracts are of particular value.

The A. C. S. News Service, 1155 16th St., N. W., Washington, D. C., will supply abstracts of papers presented at the Memphis meeting. Sets are not guaranteed to be complete, but contain abstracts from all divisions as submitted by authors. The abstracts will be mailed as soon as possible after receipt of order, beginning about April 13, and will also be on sale at Memphis.

This enterprise is undertaken in a spirit of service and not for profit. Sets are offered on the following terms:

To members of divisions who forward receipt for divisional dues with remittance and order, 50 cents.



To those without receipt for divisional dues, who remit with order, $1.00.

To those who fail to enclose remittance with order, necessitating correspondence, $1.25.

To those who require bills to be rendered, $1.50.

News Service

The A. C. S. News Service will have a press room in the Hotel Peabody. Members who are to present papers will confer a great service and promote the efficiency of the publicity work by sending synopses to H. E. Howe, director of the News Service, 1155 16th St., N. W., Washington, D. C., as far in advance of the meeting as possible.

Memphis $2,000,000 Municipal Auditorium

Group Meals

Arrangements for group breakfasts, luncheons, and dinners should be made with the Group Meals Committee and not with the hotels. All correspondence should be addressed to E. F. Williams, University of Tennessee, Memphis, Tenn. Requests, indicating expected attendance and preference as to time, should be submitted by February 14 to facilitate the work of the committee and avoid conflicts.

Equipment for Divisional Meeting Rooms

Divisional meeting rooms will be equipped with a standard lantern slide projector, screen, blackboard, pointer, chalk, reading stand, reading light, table, and ice water. Motion picture and other *special projectors can be furnished* upon the request and *at the expense of divisions if notice is given* the Meeting Rooms Committee *before February 20, 1942*. Each divisional secretary should contact his local assistant and inspect the assigned meeting room before the first session of the division. Please direct all correspondence concerning meeting rooms to J. Dudley Atkinson, Jr., 849 Biggs St., Memphis, Tenn.

Plant Trips

The chemical industries of Memphis are diversified in nature and offer opportunity for a varied program of plant visits, provided the trips do not interfere with defense efforts. It is too early to state which plants can be inspected. The following are located in and around Memphis and plants to be visited will be selected from this group:

Buckeye Cotton Oil Co., cottonseed ginners and crushers and manufacturers of chemical cotton; Firestone Tire and Rubber Co., a large southern branch of the Akron plant; Millington Smokeless Powder Plant, a war plant operated by du Pont; Bruce Lumber Co., manufacturers of hardwood flooring; Southern Refinery or Humko Co., both processors of cottonseed oil and vegetable shortening; Forest Products Chemical Co., a destructive wood distillation plant; Memphis Packing Co., a pioneer of southern packing; Commercial Chemical Co., manufacturers of arsenate insecticides; Ford Motor Co., an assembly plant; Union or Federal Compress, where cotton bales are compressed to one third their regular size for storing or exporting; dairies such as Forest Hill, Reed Brothers, or Clover Farms. A trip to the Mule Auction, a unique institution where mules are bought and sold, may be included.

The University of Tennessee Medical School, with its many branches of research, provides a point worthy of repeated visits. The biochemists may also be interested in seeing the traveling hospital in operation.

The Watkins Experimental Farm may be visited at any time, and as many trips as desired may be scheduled.

Travel Information

Motorists will find travel in the South especially inviting in the springtime. On the roads to Memphis from all directions are many places of natural beauty and historic interest which are worthy of a visit. There are the mountain parkways through the Appalachian Range in the East, the battlefields of the Civil War throughout the South, and the famous gardens between Memphis and the Gulf which will be in full bloom in April. This suggests the possibility of an added vacation tour either before or after the Memphis meeting.

Definite information concerning best routes to Memphis can be obtained through local Automobile Clubs. The Committee on Transportation and Trips is prepared to send maps with recommended routes and points of interest to those who write for them. Address C. B. Weiss, Buckeye Cotton Oil Co., Memphis, Tenn.

Students

Students of chemistry and chemical engineering are urged to attend the Memphis meeting. By doing so, they will find many opportunities to improve themselves and make valuable contacts with other students and prominent chemists

from a wide territory. A broad field of subjects will be covered in the papers presented in the general and divisional meetings. The Student Chemists Committee in conjunction with the Division of Chemical Education is sponsoring a program of papers prepared by students. A low-cost breakfast for students is contemplated at the beginning of these sessions. An additional feature will be plant visits of educational value.

The registration fee for a regularly matriculated student of chemistry or chemical engineering is $3.00. Special low-priced hotel accommodations will be available. Some schools have signified that large groups will attend. For further details address G. H. Hayden, Memphis State College, Memphis, Tenn.

Student members and paid student affiliates of the AMERICAN CHEMICAL SOCIETY, registered at the meeting, are eligible to utilize the facilities of the A. C. S. Employment Clearing House (see next column).

Golf

The annual A. C. S. Golf Tournament will be held on Thursday afternoon, April 23, at the Chickasaw Golf Club in Memphis. Participants will tee off at 1:30 P. M., and the winner will receive the Wilson trophy for low gross score.

Women Chemists

Headquarters for women chemists will be maintained at the Municipal Auditorium. A complimentary tea will be served from 3:00 to 5:00 P. M. on Monday at the Hotel Peabody. A luncheon is planned for Tuesday. Arrangements for an Iota Sigma Pi breakfast also are being made for Tuesday.

All women chemists are cordially invited to attend the Memphis meeting.

Employment Clearing House

AT Memphis the SOCIETY will again provide facilities, beginning Sunday afternoon, to bring together employers looking for chemists and chemical engineers and *members and paid student affiliates registered at the meeting*, seeking employment and wishing to make such contacts.

Candidates for employment will file records in the Clearing House on forms which provide space for a photograph, personal data, and information regarding education and experience. The records are maintained in classified files and are indexed under all fields of training and experience. This enables an employer to find quickly the records of those with the qualifications desired.

Appointments for interviews will be made at the request of employers. Private booths will be available for such conferences. No chemist or chemical engineer looking for employment and no employer looking for trained men can afford to miss this opportunity. Many personnel representatives attend each meeting solely to take advantage of the service.

Candidates for Employment

By action of the Board of Directors (December 12, 1940), the Employment Clearing House is open only to members and paid student affiliates of the AMERICAN CHEMICAL SOCIETY registered at the meeting.

Advance registration is helpful to the registrant and to the staff of the Employment Clearing House. Please request the necessary forms from the AMERICAN CHEMICAL SOCIETY, 1155 16th St., N. W., Washington, D. C., in the near future. Forms will not be available to inquirers until February 1; requests received before that date will be filled as soon as possible. Forms can be completed under more favorable circumstances at home than in Memphis. If returned by mail well in advance of the meeting, trained Clearing House personnel will suggest, when desirable, changes that will make the record more serviceable to employers. Advance registration also enables completion of much of the clerical work in Washington, thus relieving congestion at the meeting. Records filed in advance cannot be inspected by employers until after the arrival of the registrants, since all users are assured that everyone whose vita is on file is available for interview. Those who do not file vitae by mail may fill out the forms in the Clearing House after arrival.

Since employers begin inspecting these vitae on Monday, most effective use is made of the records of those who arrive early in the week. At the most recent Clearing House, a larger proportion of interviews and offers of employment were received by those who registered during the first two days.

Amplification of the data on the forms and lists of publications cannot be accepted for filing in the Clearing House. Many employers decline to interview an individual whose photograph is not on his record; therefore, each person should bring with him two copies of a *good* picture (look pleasant; avoid flashlight photographs), not larger than 2.5 × 3 inches, and attach them to duplicate copies of his vita.

Employers

By action of the Board of Directors (December 6, 1941), the Employment Clearing House is not open to any employer or employer's representative "who, in offers made as a result of interviews in the Clearing House, is unwilling to meet the recommendations unanimously adopted

---

Hotel Committee, Memphis Chamber of Commerce, Hotel Peabody, Memphis, Tenn.

Dear Sir: Please make hotel reservations noted below: _____ 1942

Hotel _____ First choice

Hotel _____ Second choice

Hotel _____ Third choice

If the hotel of first choice is unable to accept the reservation, the Hotel Committee will endeavor to comply with your second or third choice in the order named.

_____ Double rooms for _____ persons _____ Rate desired $_____ to $_____ per day

_____ Single rooms _____ Rate desired $_____ to $_____ per day

_____ Suite—parlor _____ bedroom(s) for _____ persons Rate desired $_____ to $_____ per day

Arriving April....., hour.....A. M.....P. M. Leaving.....

Please attach sheet listing additional names if necessary.

Signature_____

at the Atlantic City meeting of the AMERICAN CHEMICAL SOCIETY in its resolution on employer-employee relationships". (See NEWS EDITION, December 25, 1941, page 1442.)

Although employment of chemists and chemical engineers is at a high level owing to the demands of rapidly expanding industry, it is our expectation that employers will find in the Memphis Clearing House registrants whose availability might not otherwise be known. They will be drawn primarily from two sources: The small midwestern colleges not scouted by industry and those individuals seeking a change of employment, especially chemists and chemical engineers in nonessential industries wishing to make new connections in order to contribute directly to the defense program. Many employers expected a small Clearing House registration at the past two meetings. Actually 324 were available for interview in Atlantic City and 527 in St. Louis. At each of these meetings more than 1,000 interviews were arranged.

Those who have never visited an A. C. S. Employment Clearing House will find this unique employment aid of definite service if their experience follows that of those who regularly use it. Many employers send personnel department representatives to each meeting solely to take advantage of this service. The number of employers regularly using the A. C. S. Employment Clearing House at national meetings of the SOCIETY indicates that this activity is meeting a real need.

The forms filed by candidates for employment provide space for a photograph, personal data, and information regarding education and experience. A classified index will be maintained so that one can find quickly those with the special training or experience desired. A private room will be available in which employers' representatives may inspect the index and vitae at any time from Monday through Friday. At the request of the employer, interviews will be arranged promptly with any whose records are on file. The space available in Memphis will again permit erection of private interview booths.

We know of no other place at which one can find not only the records of such a diversified group of chemists and chemical engineers, but the individuals themselves. Any employer, having a vacancy to fill or anticipating one, can ill afford to pass up this opportunity to make personal contacts.

The advantages to employers are many. They may inspect these records without any of the registrants knowing they are looking for chemists. Personal interviews are always more satisfactory than correspondence; this plan makes available to each employer individuals from widely scattered localities who otherwise could be interviewed only through time-consuming and costly travel.

Plan on using the A. C. S. Employment Clearing House in the Municipal Auditorium, Memphis, April 20 to 24, 1942.

Final Program

The final program will be printed in the March 25 issue of CHEMICAL AND ENGINEERING NEWS.

CHARLES L. PARSONS,
Secretary

Survey of the Chemical Profession

THE Committee on Economic Status of the AMERICAN CHEMICAL SOCIETY is happy to report a very gratifying response to the mail questionnaire survey of the members of the AMERICAN CHEMICAL SOCIETY which is being conducted in cooperation with the United States Bureau of Labor Statistics.

On November 25, 1941, the bureau mailed 24,490 questionnaires to all individual members of the SOCIETY, except students, resident in the United States and its possessions.

The committee has been informed by the Bureau of Labor Statistics that, as of December 23, 1941, a total of 18,169 questionnaires, or 74.5 per cent of the original mailing list, had been returned. Of these, 16,848 or 68.7 per cent of the original mailing list have been transmitted to the bureau's Machine Tabulation Division for the preparation of the punch cards which will be used in the eventual analysis.

The remainder, totaling 1,321 questionnaires, cannot be included because of errors in answering certain questions. Thus, 835 were not coded for sex by respondents; 432 were improperly coded for educational level; and 54 members did not furnish information concerning the year in which they entered the profession.

Questionnaires are still coming in but at a very much reduced rate. The committee wishes to emphasize that *January 15, 1942, is the closing date for receipt;* questionnaires received later than this date cannot be included in the tabulations to be made at this time. It is also pointed out that all questions must be answered according to the instructions given in the form; otherwise the returns cannot be used.

It is estimated that the basic tabulations will be made available to the A. C. S. Committee on Economic Status by the Bureau of Labor Statistics early in February. In the interim, certain preliminary information is being compiled for the purpose of guiding the committee in formulating the program for the final publication of the data.

Register with the National Roster of Scientific and Specialized Personnel

THE National Roster of Scientific and Specialized Personnel in Cooperation with the AMERICAN CHEMICAL SOCIETY is now conducting a survey of the senior and graduate students of chemistry and chemical engineering in the universities of the country. It is urged that all persons with training in this field register with the National Roster as soon as possible.

The registers of this organization, containing the names of the scientific and professional individuals of the Nation, are of the utmost importance in our present crisis. They must be replenished and kept current in order that there always will be a supply of trained men and women to handle any situation or carry on any research which is essential to our war effort. Registering with the National Roster is one way in which the trained individual can do his part. An occasion may never arise when an individual would be asked by the Government to serve. On the other hand, the time may come when persons with certain skills will be vital to the welfare of the Nation either as full time workers, part-time workers, or as consultants.

Nothing has ever been lost through preparedness. Therefore, it is again urged that all specially trained persons who have not already done so register immediately with the National Roster of Scientific and Specialized Personnel. This can be accomplished by writing to Erle M. Billings, consultant, 343 State St., Rochester, N. Y., stating the field in which you are trained.

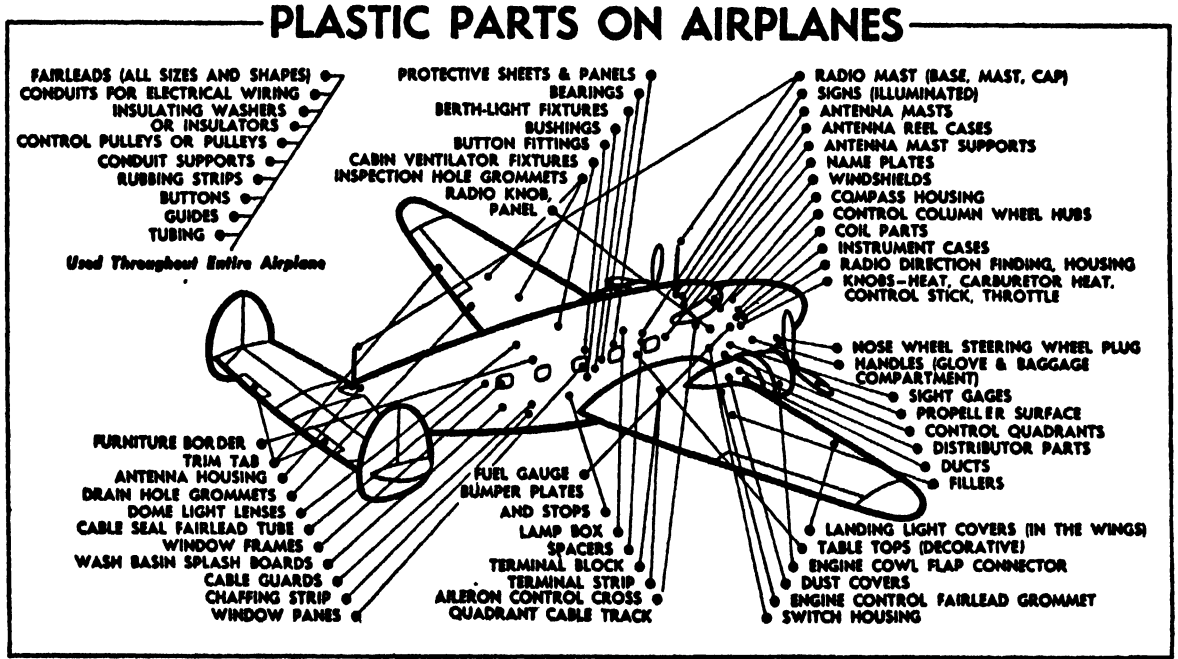
Industrial Research in the United States

WILLIAM A. HAMOR

CONTINUED FROM PAGE 30

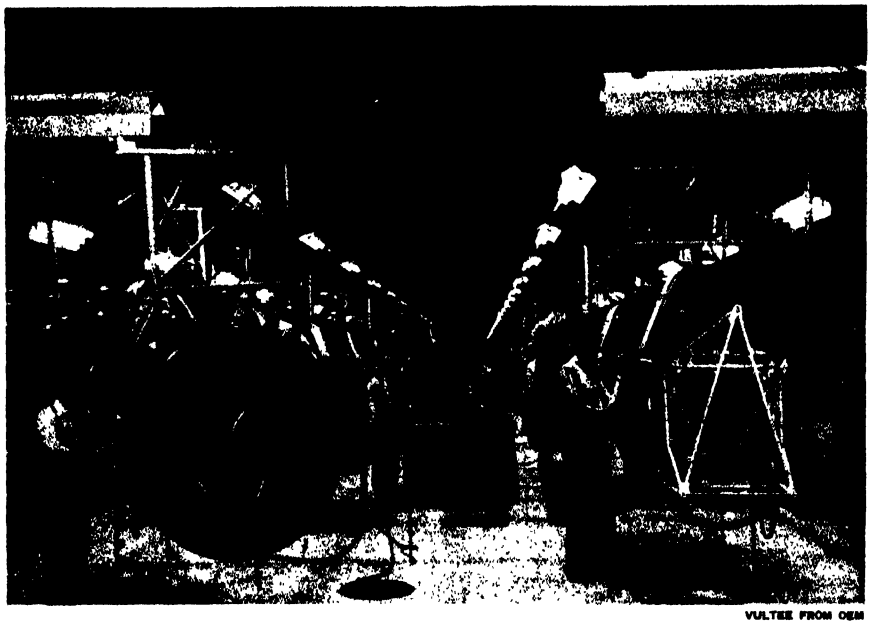
gaskets and rings to seal lubricants in bearings; Ameripol seals are being utilized on airplane hydraulic systems. Ameripol is also employed in sheet packings. Ameripol sponge is in production.

Compounds prepared by reacting fatty acids or fats with butadiene, indene, isoprene, and other unsaturated hydrocarbons, in the presence of catalytic agents, continue to show promise, specialists say, in the fields where flexible coatings are desired. A project at the Northern Regional Research Laboratory at Peoria relates to the making of synthetic rubber from corn.



Beauty and Worth Glow in Plastics

The characteristic value of plastics is their nearness to everyone; their story is ever the voice of romance in industrial research. More than 125,000 tons of plastics were produced in the United States in 1941. Research is the engine on the train of thought in plastics technology, and plasticians, cherishing the useful and the esthetic, continue to transport new resins into commerce. Seventeen novel plastics were introduced between 1928 and 1939. The pace of plastics research is indicated by the fact that three quarters of all the plastics du Pont produced in 1941 are developments that emerged from the laboratories in the past 48 months. At least 13 types of plastics are on the market.



The Plastics Materials Manufacturers' Association is assisting the Government in defense and the industries in the substitution of plastics for metals. To cite some examples of plastics in defense work, shock-resistant compounds are finding outlets in instrument cases for aircraft, fuse timers, electrical fittings, and gun stocks; laminated and plywood products are of high importance to present-day construction methods both in airplanes and in the new motor torpedo boats. A branch has been set up in the War Department to work out substitution of plastics for metals and other scarce materials in articles purchased by the Quartermaster Corps. Increased use of plastics by the Government has led to the desirability of federal specifications for such products to simplify purchasing procedure, and a technical committee has been formed for the purpose. The National Bureau of Standards has under way a project, in cooperation with the National Advisory Committee for Aeronautics, to develop a plastic for use not only as a substitute for nonstructural parts, but also for those structural units subject to stress. Comparative burning tests of common plastics have been made by the Underwriters' Laboratories. New heat-resistant plastics under development include preparations of furfuryl alcohol and ethyl silicate. The trend in the use of plastics in recent years has been toward industrial applications rather than for ornamental purposes. For instance, comprehensive researches conducted in the laboratories of Resinous Products & Chemical have led to the development of new synthetic resin exchange adsorbents. Kyrite, a Dicalite product for use as a purifying agent in the sugar industry, consists of an active resin deposited upon a diatomaceous base.

Progress in Molding Practice. Extruded plastics are available in over 60 shapes. Commercial articles manufactured by injection-molding machines vary from a tiny doll's eye to windows for the housing of roadside gasoline pumps. The increase in the use of thermoplastic molding powders has been greatly assisted by the rapid development of injection molding, which is coming into use for the lower-cost, heat-setting plastics. Du Pont announced improvements in injection molding whereby electrical heating, working, and cooling of a granulated solid in a cylinder make it rigid enough for ejection into certain forms. A method for thermosetting resins, known as transfer molding, is extending the design of pieces made from phenolic and urea molding powders. The possibility of obtaining vulcanized molded articles from polyvinyl acetate, acrylic esters, cellulose derivatives, and shellac should extend the range of usefulness of these materials.

Plastics in Aircraft and Automobiles. In studying uses of plastics in bombers, 600 bomber parts were tested with plastic substitution and 34 parts were found practicable in this material. Extensive experiments are being made with plastic false windshields for 37-mm. armor-piercing shells, bodies of bomb fuses, and fins for mortar shells. Glenn L. Martin has devoted considerable attention to possibilities of incorporating synthetic materials into structures of military aircraft; aircraft plywoods, bonded with resinous materials moistureproof and inert in character, nullify to a great extent the disadvantages found in earlier types. Fluorescent Formica laminates are utilized in instrument panels of bombers and pursuit planes. The first seaplane equipped with plastic floats made its initial flight. Increased use of plastics by the automobile industry is observed in 1942 motor cars, in which more than 120 parts are made of

CHART— COURTESY OF E. I. DU PONT DE NEMOURS & CO. (INC.)

VULTEE FROM OEM

At the half-way point of Vultee's mechanized final assembly line

these materials. One automobile manufacturer foresees that plastic fenders will eventually absorb a blow 10 times greater than steel without denting. For soundproofing, a thermoplastic solution is sprayed on the underside of the steam-cleaned metal parts of automobile bodies. Muf-L-Cote is to seal cars underneath against snow, rain, and dirt. Experimental work and plans were described for producing plastic automobile bodies at Ford Motor.

Plastics in the Home. Plastyle furniture was introduced. A new process was announced for speeding the production of plastic phonograph records. A composite 1941 radio-receiving set has over 30 separate plastic parts; more than 60 plastic applications are possible on a six-tube set. Sonora Radio and Television expressed the belief that a radio receiver offered at $9.95 in a plastic case would have to sell for $14 or $15 if made of wood. Plastics have increased the sale of electric clocks. Dumor Plastics developed a material for electrical insulation. A composite 1941 electric refrigerator has some 39 plastic parts and more than 77 possible plastic applications; electric refrigerators are scheduled to have in 1942 more than 50 plastic parts. A project calls for the construction of refrigerator frames entirely of plastics.

Plastics in Industry and Commerce. In the field of gas-meter diaphragms, progress has been made on the preparation of drip-oil-insoluble resinous materials possessing high flexibility and low resilience. Artus is a line of milling cutter spacers molded of a plastic. Celluplastic capsule-type containers are intended to show or store tools. A silver chest of transparent plastic enables ready display. Koloplaks are colorful molded advertising signs. Translucent plastic buttons serve as bull's-eyes to transmit light from internal sources in equipment. A plastic wall material admits diffused light from lamps placed behind it. Tulca units are transparent plastic lenses. A plastic molded motion-picture screen is seen to be efficient and easy to clean. Autopen is an automatic electric rewrite machine to reproduce as many as 100,000 pen-and-ink signatures from one plastic master signature. United Autographic Register reported a sales gain of 30 per cent since it began using plastic material for registers. A survey revealed there are 18 applications of plastics in 10 different sports. Plastic heels for ladies' shoes came into use; Pipon is a plastic shoe-trimming braid. More than 25,000,000 pencils have plastic eraser holders. Densene is a plastic denture-base material; Vitain is a synthetic resin powder for denture use. Plastic eyes are under trial in monocular persons. AcromarK is a marking ink for plastics.

Cellulose Nitrate. Cellulose nitrate, the old timer of thermoplastics, still finds important usage in the automotive industry. Hammers with heads of Pyralin cellulose nitrate are employed extensively. Pearl Pyralin has become popular for bathroom accessories; drum coverings in sheets of colored or pearl effects, picks for banjos, guitars and mandolins, and piano keys are other Pyralin applications. Cellulose nitrates can be prepared from whole cotton without intermediate pulping; cellulose acetates can be produced from whole cotton but more readily from a high-cellulose pulp.

Cellulose Acetate. The chief factors determining the properties of cellulose organic ester thermoplastics are the amount of noncellulosic material, whether chemically bonded to the chains or colloidally held, and the kind of plasticiser retained by such colloidal bonds; both spatial structure and substitution of the plasticizer are important. A transparent tubing is made by spirally wrapping acetate tape over a steel form and using acetate cement for adhesive. Mar-Les shields for the protection of switch plates and adjoining wall areas are made of cellulose acetate; Protec-O-Shield is a similar product. In lampshades, cellulose acetate appears in plain, pleated, and cartridge shapes, also in stylized offerings, veering toward soft, restful colors. American Viscose introduced transparent cellulose acetate tags for its rayon. Liquafilm is a cellulose acetate solution for applying to paper with the aid of electric heat. Klipit is a cellulose acetate clothespin. Metex consists of three laminated cellulose acetate sheets, the center one metallic finished. Tenite is seen in window shades on busses, in tops of sirup pitchers, in fish net floats, in the casings of leash reels, in tool and revolver handles, in oil cups, and in graduates and funnels in laboratories. Extruded moldings of Tenite are being made in a variety of shapes, sizes, and colors. Tenite I and II in a wide range of colors are the basic materials of Plastikmould, Plastiktrim, and plastic rods and tubes for architectural purposes. Interlox plastic trim is extruded Tenite II. Plasticoils are springlike coils of Tenite for fitting over fluorescent light tubes. Automobile club emblems of Tenite have been subjected to severe tests of durability. Lightweight handbags are composed of colored Tenite strips woven in with white. Ocarinas, radio dials, lenses, and knobs, "juke box" coverings, and piano music racks are applications of Plastacele. Salt and pepper shakers are also being made of Plastacele. Cellulose acetate-butyrate has many possibilities for continuous extrusion. Plasticans of cellulose acetate-butyrate are the plastician's contribution to the packaging of liquids in quantity.

Phenolic Resins. Bakelite has more than 15,000 patented uses. Range finders are being manufactured of Bakelite, and Bakelite and Eclipse Molded Products have developed a plastic agitator for washing machines. The production of Durez has been increased 40 per cent. The heat resistance of Durez 775 black is said to be 400° F. FCD No. 140 is a high-melting, extra hard phenolic resin. Cast phenolic resins are made by Catalin and its licensees, Bakelite, Joanite, A. Knoedler, Marblette, and Monsanto. The production of cast phenolic resins approached 6,000,000 pounds in 1941; the principal applications include phonograph decorations, jewelry and dress ornaments, brush backs, and radio cabinets. Catalin is used in the gear for an oil pump. A building panel faced on both sides with phenolic impregnated cotton fabric has been marketed. Plastone is a molding compound made from phenolic resin with cottonseed hulls as filler. Cottonseed-hull plastic products

have proved satisfactory in the manufacture of sheaves for textile mills. Co-Ro-Lite is Dures-resin-impregnated sisal fiber. Amberlites PR-14 and PR-23 are phenolic plywood adhesives; Catacol is Catalin cold-setting phenolic cement; Catavar, liquid Catalin, is used for laminated products. Synbar developed a phenolic glue for plywood. Laminated phenolic plastics are used for large flat springs designed to support the shaking rail of paper-making machines and for racks, insulators, cylinders, tank linings, baffles, baskets, and hoods in the plating field. A study of the heat resistance and dimensional stability of plastics in boiling water has resulted in the development of a special laminated phenolic-type water-meter disk for application in meters operating continuously under these conditions. Other types of plastics are in the process of development for employment in water meters at medium and high temperatures. Lamicoid, laminated Bakelite sheet, is being used for floors and stair treads and in Venetian blinds. Blades of Westinghouse electric fans are almost entirely made of phenolic resin. Kys-Ite service trays are molded under Carterite license and similar preformed material is being considered for business machines and camera cases.

Polystyrene Resins. Polystyrene resins are produced by Bakelite, Dow, and Monsanto, and it is probable Catalin will enter the field. Polystyrene, heated near 180° F., changes into a soft, ductile plastic; at 212° F. it becomes rubbery. Plax is producing polystyrene and styramic resins in rod form. Continuous tubes and shapes are supplied in Lustron polystyrene. Polystyrene is resistant to hydrofluoric acid.

Elastomeric Compounds. The position of elastomeric compounds in the field of plastics has become increasingly important during 1941. These compounds, as their name implies, are flexible or rubbery at normal temperatures, a characteristic rendering them adaptable to many applications; furthermore, the degree of flexibility may be controlled by the amount of plasticizer used. Elastomeric compounds may be formed into various articles by compression or injection molding; rods and tubing may also be produced by the screw-extrusion process. The flexible material may be injection-molded in the same manner as the rigid type of Vinylite compound. Bite-resisting pipe bits and cigaret holders have been injection-molded; injection-molded insulators, which may be stretched over exposed electric wire terminals in airplanes, have been developed. Compression-molded collets for carbon rods in electroplating baths have proved more resistant to hot electrolytic solution than rubber collets. Lens rings for industrial flashlights, designed to withstand rough use, are being commercially compression-molded from the semi-rigid type of material. Aside from the use of elastomeric compounds for electrical insulation of wire, many other varieties of extruded forms have come into use. Metallic cooling coils, which require frequent cleaning, especially where employed in draught-beer dispensers, are being replaced by elastomeric tubing. Elastomeric compounds have been extruded over leaders for dry-fly fishing and into upholstery welting.

Vinyl Elastomers; Vinylite. Umbrellas, watch chains, and cosmetic, shoe, garment, and laundry bags are being made of vinyl elastomers, some formed by calendering, some by extrusion. In most of these articles advantage is taken of the protective qualities of the plastic, but all lend themselves to new and beautiful styling; the feature of transparence adds to their sales appeal. Vinylite compounds in tape form have been developed for providing electrical and protective insulation on many types of circuits, including automotive and aircraft lighting, power and ignition harnesses, naval and industrial power cables, and bus-bar distribution systems. These tapes may be of an all-resin type or, where greater mechanical protection is required, may be reinforced by calendering or hot-roller coating on asbestos, glass, or other fabrics; combinations of all-resin and reinforced tapes are often used. Vinyl acetate and diallyl succinate can be polymerized together to give a series of products, some of which may be useful for new types of cast plastics.

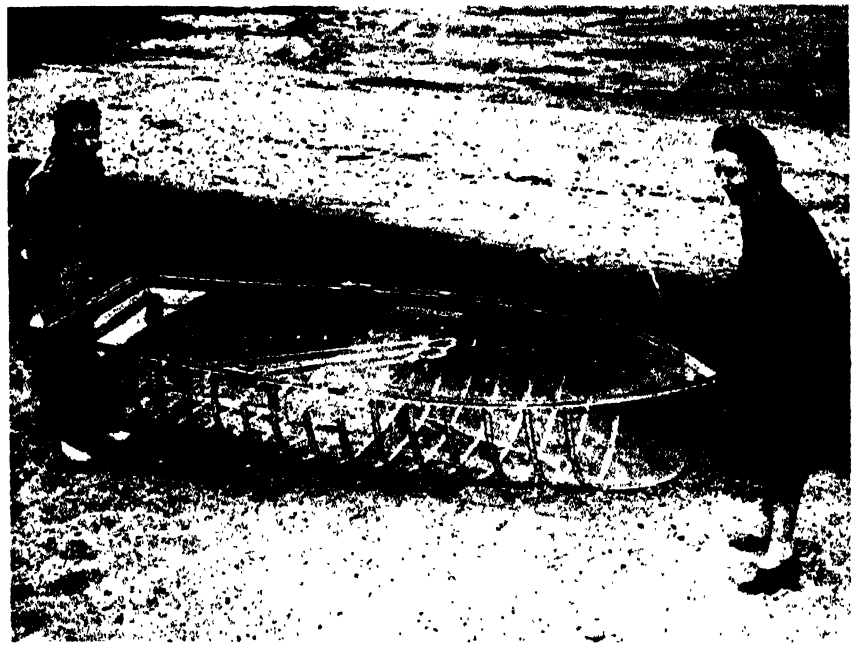
Koroseal, P. V. A., and Saran. Koroseal is available in monostrands and also in film and tubing. Polyvinyl alcohol is well known in the form of flexible refrigerant hose. Type H Polaroid, a glare-eliminating screen for automobiles, claimed to be 99.99 per cent efficient, uses polyvinyl alcohol, stretched, then treated with iodine. Polyvinyl alcohol plastics form a link between synthetic resins and rubber, including synthetic rubbers. The fractionation of polyvinyl chloride has been described. It is predicted that, before long, woven plastic such as vinylidene chloride will get into the summer hat trade. Saran fabric, woven like cloth, is under development as an upholstery material. Saran has been proposed for use in the place of metal in tubings.

Urea and Melamine Resins. A foamed urea plastic appears to be an insulator for heat and sound. Plaskon is applied in wheels of colored furniture casters. Both hot- and cold-setting Plaskon glues are in use in airplane construction. A new method of applying resin surfaces to dense materials such as laminates has been announced by Plaskon. Uformite CB-550 is a urea-formaldehyde resin to serve as a bond in wood construction. Cascamite is a urea-formaldehyde glue. Foamed urea-formaldehyde glue is thought to have a future in the manufacture of very thin plywood. Urea-formaldehyde film-forming compositions are now made to air-dry by special acidic accelerators soluble in organic solvents, including hydrocarbons; these accelerators consist principally of inorganic acid esters of alcohols. Additional research is necessary to standardize conditions of preparing ethylidene urea-formaldehyde coatings so as to improve flexibility and stability. Melamine-alkyd compositions are reported superior in color retention to the corresponding urea-alkyd enamels based on a time-hardness study at 350° F. Chemical resistance of heat-converted melamine resins is said to be equal to or better than that of the corresponding urea resins. With No. 3501 new Super-Beckamine it is claimed higher percentages of melamine can be incorporated at lower cost than is possible with any blend or admixture of urea-formaldehyde and melamine resins.

UNION CARBIDE AND CARBON CORP.

Plasticized vinyl resin compounds are used to insulate this marine cable

Acrylic Resins. Acrylic resins are made by du Pont and by Röhm and Haas, and it has been rumored that Celanese may become a producer. The acrylic gun turret is an improvement over the "blisters" formerly used on bombers; the acrylic navigator's hatch is also a recent development. A transparent, shatterproof acrylic plastic is utilized in planes for windows, noses, tail empennages, and landing light covers. A transparent Plexiglas pump for handling dilute acids, hypo-



ROHM & HAAS CO.

In producing bomber nose sections, edges of a hot Plexiglas sheet are quickly clamped to a form before the material cools.

chlorites, and other chemicals is being marketed. Methyl methacrylate plastic is being employed for safety guards of coil-winding machines. A conveyor apron made of Lucite methyl methacrylate resin rods is an innovation on textile-conditioning machines. Du Pont has doubled its capacity for the manufacture of transparent Lucite sheeting.

Uses of Lucite. Seventy applications on fourteen 1942 automobiles attest to the use of Lucite in this field; two 1942 models each have 11 parts of Lucite. Protective reflectors of Lucite are mounted on approximately 500,000 automobiles in California. Transparent sections of chemical and oil feeders are the newest industrial equipment made from Lucite. A portable fluorescent light, incased in a tube of transparent Lucite, speeds night work on airplane assembly lines by providing illumination for confined areas. Beamlight is a flashlight with a lens of Lucite for examining inaccessible parts of machinery. Lumirod is a Lucite device for demonstrating the internal reflection of light. Lucite has been adapted for fabricating darkroom light filters. Prismatic pendants of crystal clarity produced of Lucite are appearing on many chandelier and lamp designs. Lucite is also applied as a spiral to the shaft of metal floor lamps. Lucite door pulls and push bars are being used on metal and wooden doors; there is likewise transparent hardware for tempered glass doors. Cigaret cases, compacts in jewel tones, bracelets, flower plaques, scarf slides, coat hangers, and picture frames are being manufactured of Lucite. A transparent typewriter roll has been introduced by Lumirol. Musical applications range from piano keys to allplastic clarinets: beauty and worth, joined together in Lucite, serve well a happy art.

The field of industrial research in the United States has been the scene of very many valuable and dramatic deeds that have aroused public enthusiasm and confidence. And now that military needs are investing scientific creativeness with transcendent importance, the capacity and energy of American laboratories will proceed with this new responsibility to bring greater grandeur to the technology of the Nation.

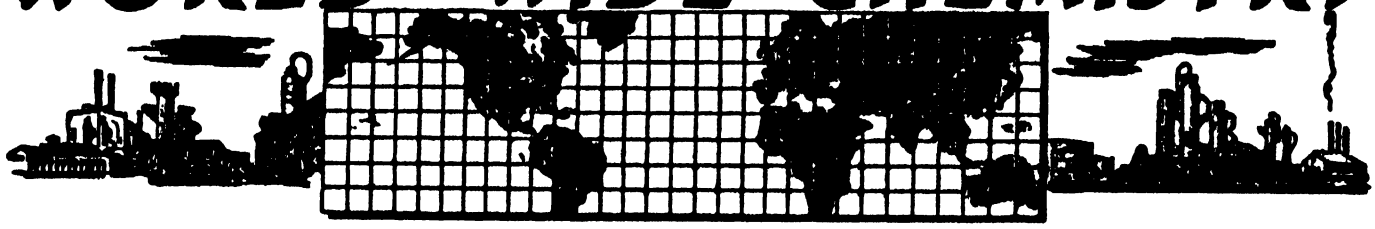
A rowboat made entirely of du Pont's Lucite methyl methacrylate

American Society for Metals Advisory Service

THE American Society for Metals, Cleveland, Ohio, has announced a free technical information and advisory service to companies engaged in war production work involving metals. The plan embodies the formation of A. S. M.-War Products Advisory Committees in more than 50 chapter cities of the Society. The board of directors has suggested that each local chapter form such a committee to provide answers to technical questions relating to both the manufacture and fabrication of metals. The service will be free and will be carried on by local chapter committees so that greater, speedier attention may be given the localized problem.

Return of Empty Carboys

A STICKER ringed in red, white, and blue, designed by Ray Mountain, Rumford Chemical Works, Rumford, R. I., has worked well in ensuring the return of empty carboys. It states:



Unless this container is promptly returned
Several firms working on defense
Assuredly will run short of chemicals.

First Aid for the Manufacturer

IN THE interest of national defense, the Association of Consulting Chemists and Chemical Engineers, Inc., 50 East 41st St., Room 82, New York, N. Y., makes available its free services in providing the names of experienced consultants in chemistry and chemical engineering properly equipped to assist in solving problems in various fields.

The Process Equipment Division of the H. K. Porter Co., Inc., Pittsburgh, Penna., announces the appointment of J. H. Hille as Chicago district representative.

WORLD-WIDE CHEMISTRY

A plant for caffeine extraction from maté went into production October 21. The factory, which belongs to the Sociedade de Intercambio Mercantil Argentina-Brasil, will use 6,000 kg. of maté per day to produce about 60 kg. of caffeine. Caffeine is being sold at present at 600 milréis (about $30) per kg.

Exports to U. S. Compensate for Losses in European Trade

The value of Brazil's exports to Europe during the first seven months of 1941 were about 686,560 contos de réis ($34,328,000) less than in the same period of 1940. In compensation the United States increased its purchases by 800,226 contos de réis ($40,011,300).

During the first eight months of 1941, 250,123 metric tons of manganese ores valued at 44,854 contos de réis, were exported. The United States was the largest buyer, taking 94.6 per cent of the total. The balance went to Japan.

In 1939 Brazil exported 435,183 kg. of mica valued at 7,890 contos de réis. In 1940 volume and value of mica exports increased to 1,117,474 kg. valued at 15,755 contos de réis. Exports during the first six months of 1941 were 460,700 kg. The average price per kilogram, which in 1939 was 18$230 (about 91 cents), has now gone to 31$690 (about $1.58).

Decrees Issued on Production and Distribution of Fuels

President Vargas has prohibited exportation of Brazilian Santa Catarina coal on the grounds that present production is unable to fill local requirements. In 1940 Brazil produced 1,336,301 metric tons, against 1,046,443 in 1939. Even with this output Brazil imported 1,209,242 metric tons. In another decree President Vargas created the National Fuels and Lubricants Commission, which will have to do with distribution and uses of these products.

During the first six months of 1941, Brazil consumed 211,442 metric tons of gasoline.

To develop and spread the use of producer gas for motor trucks, President Vargas authorized the Ministry of Agriculture to spend 3,000 contos de réis ($150,000) for purchase or construction of 1,000 gazogenes (apparatus for generating gas) which will be sold to motor truck owners at cost to be paid in monthly installments.

American Firm Builds Cashew Nut Oil Plant

The American firm, Irvington Varnish Co., has started to build a factory in Fortaleza, capital of the State of Ceará, for production of cashew nut oil. The machinery was imported from the United States, and the new plant will be in operation early in 1942. The oil will be obtained from nuts collected and purchased in the northern states where the yellow pear-shaped fruits are found in large quantities.

Cashew nuts until recently were considered as waste material. In 1939, 460 metric tons of cashew nuts were exported, however, and in 1940 the amount increased to almost 700 metric tons.

Construction of Two New Cement Plants Planned

Two new cement plants probably will be under production in 1942. One will be installed in the State of Rio de Janeiro with an estimated production of 200,000 metric tons, and the other will be built in the State of Pernambuco to increase the output of the S. A. Fabrica Votorantin, of São Paulo, manufacturer of the trademarked "Votoran".

In 1926 Brazil imported 396,322 metric tons of cement and produced only 13,382 tons. By 1940 only 14,976 metric tons were received from abroad, while domestic output was 733,722 metric tons. With construction of the two projected factories and enlargement of the present plants, Brazil's production of cement should reach more than 1,000,000 metric tons in the next two years.

New Plants Established in Drive for Self-Sufficiency

The press has reported the opening of new plants for production of vegetable oils in Rio Grande do Sul; cellulose and paper in Santa Catarina, employing pine trees from Gramado, near Caçador; nitrates and other chemical products in São Paulo; textiles (three mills) in São Paulo and Minas Geraes; anhydrous alcohol in Minas Geraes and Baía; cottonseed oil in Baía; cellulose in Pernambuco, using cane sugar bagasse; perfume and cosmetics in Minas Geraes; abrasives in Paraná; tannins from the *Acacia negra* in Rio Grande do Sul; and soaps in Rio Grande do Sul and Paraíba.

A large factory for manufacture of equipment and heavy machinery for refineries for alcohol, ether, acetone, oils, and solvents was recently started in São Paulo. The plant is also equipped to construct stainless steel machinery and apparatus for chemical industries.

Plant Being Installed to Extract Tomato Seed Oil

Tomato seeds, obtained as a by-product in the preparation of tomato pulp, contain a large percentage of oil. One of the biggest producers of tomato pulp in Pernambuco is installing a plant for extraction of tomato seed oil. It was estimated that about 18 per cent of oil will be obtained, besides 48 per cent of cake. The oil will be used for soap manufacture; the cake as a fertilizer.

Potassium Carbonate to Be Produced in Brazil

A plant was recently installed in the State of São Paulo for production of potassium carbonate using as raw material ashes from cottonseed cake. Cottonseed cake, because of difficulties in exporting, was being used on a large scale in Brazil for fuel purposes.

Citrus Fruits Processed for Oil, Cake, and Juice

According to figures published by the Federal Council for Foreign Trade, sev-

---

EDITOR'S NOTE. Those interested in further details should address the correspondent whose name and address appear for each country, and enclose sufficient international coupons to prepay the reply. United States stamps should not be sent.

eral factories are processing citrus fruits for various by-products. In a plant at Taubaté, 20 metric tons of oranges are handled daily during the crop months, giving a daily output of 8,500 liters of pure orange juice, 1,280 liters of concentrated juice, 50 kg. of essential oil, and 4,000 kg. of cake. A second plant, belonging to the Sociedade Anonima Industrias Reunidas de Amido, at Sorocaba, State of São Paulo, treats 20 metric tons of oranges per day to produce 500 liters of concentrated juice, 100 kg. of essential oil, 2,400 kg. of cake, and a quantity not revealed of brandy and pectin. At Limeira, State of São Paulo, another concern produces 15 tons of essential oil, 6 tons of calcium citrate, and a small quantity of brandy yearly.

Caixa Postal 970
Rio de Janeiro
December 3, 1941

The National Chemical Laboratory (Laboratorio Químico Nacional), established by the Colombian Government to study and promote use of domestic raw materials and to aid manufacturers and technicians in solving problems related to the utilization of native products, will undergo a reorganization in its new building in 1942.

Colombian Chemical Society Elects Corresponding Members

The following South American chemists have been elected corresponding members of the Sociedad Colombiana de Químicos: Raúl Wernicke and Venancio Deulofeu of Argentina and C. E. Nabuco de Araujo, Jr., of Brasil.

Deposits of Manganese, Asbestos, Ceramic Materials, Bauxite Studied

Natural deposits, particularly of strategic materials, are being studied.

Manganese ore has been located in the State of Huila. The ore in all deposits, in so far as samples taken at random determine, is from 36 to 44 per cent MnO_2.

Investigation of asbestos deposits has been made by the National Chemical Laboratory.

This laboratory is also studying mineral deposits where raw materials used in the ceramics industry may be found.

Small bauxite deposits have been located in the State of Antioquia.

Cement and Sugar Industries Enlarged by Plant Construction

A new sugar mill, Ingenio Central del Tolima is to be established at Pajonales, Ambalema, State of Tolima, within the present year.

One cement plant, with a daily production of 200 tons, has gone into operation near Cali, State of Valle. A second one is being erected at Nare, State of Antioquia.

Colombia Plans to Build Steel Industry

A contract was signed recently preliminary to installation of a steel industry near Bogotá. The Geological Survey and National Chemical Laboratory are cooperating in this program.

Project for Soda Ash Production Developed

Included in a bill authorizing the Colombian Government and the Banco de la República to participate in setting up and expanding industries using salt as raw material are plans for a soda ash plant at Zipaquirá, Cundinamarca. The project has been developed by the director of the National Chemical Laboratory. Alkali production will constitute the principal chemical output in Colombia. Soda ash, caustic soda, and sodium bicarbonate requirements will be met by local production.

Jorge Ancízar-Sordo

Apartado 18
Bogotá
December 4, 1941

Increasing demands for labor in the chemical industry are predicted by F. W. Bain, chairman of the Chemical Control, who said that 1,400 men are required immediately and 4,000 more would be wanted in the next three months. There are also vacancies for 8,400 women, of whom 4,800 would be needed for explosives in Scotland.

A pamphlet has been issued by the Ministry of Supply advising chemical firms about women workers. Women now account for 23 per cent of all labor in British chemical works, and are recommended for charging furnaces with automatic weighing machines, filling drying trays and attending to drying ovens, operating filter presses, digging out centrifuges, crystallizing and emptying crystallizers, taking samples for analysis, routine chemical testing, washing and cleaning carboys, etc., light shovel work (not involving throws above shoulder height), elementary drilling, screwing, milling, garage servicing, assisting fitters, welders, electricians, painters, carpenters, molders, and bricklayers, and attending to and recording machine operations. Women have not been able to replace men in heavy manual work, although generally speaking three women can do the work of two men if working conditions are suitable adjusted, in work which must be done in the presence of noxious gases, in handling certain dangerous or toxic materials, and in operations involving considerable discomfort.

Pharmaceutical Manufacturers Form Joint Research Company

The Therapeutic Research Corp. has been formed by five leading British pharmaceutical manufacturers—Boots, British Drug Houses, Glaxo, May & Baker, and the Wellcome Foundation—to coordinate and extend research. The company, which has a capital of £500,000, is an entirely new development in the British pharmaceutical industry, formerly characterized by numerous private research institutes working without direct contact. The five organisations mentioned above will, where desirable, negotiate agreements with other manufacturers of recognized standing. Research plans are to be drawn up by a Research Panel. The new company is also to ensure collaboration with medical, dental, and veterinary practitioners in the introduction of new medical substances and to enable the industry to cooperate more effectively in national planning by presenting to the government the pooled knowledge and facilities of the constituent companies.

Drug Research in America and in Germany Compared

A tribute to American research work on the chemistry of drugs was paid by Harold King, National Institute for Medical Research, in a speech delivered on presentation to him of the Hanbury Medal. The present output of papers dealing with the chemistry of drugs in the United States is amazing, he said, and surpasses that of Germany in her prime. Great Britain needs more organized research on synthetic drugs, Dr. King added.

Zinc Smelting Combine Forms Chemical Subsidiary

The National Smelting Co., Ltd., a company intimately connected with the British zinc smelting and refining industry, has formed a new company, Avonmouth Farms, Ltd., with a capital of £25,000, to manufacture fertilizers and chemical products.

Potassium Nitrate Slows Down Cheese Fermentation

Use of potassium nitrate to prevent fermentation of processed cheese has been

studied by H. J. Palmer and W. H. Sly who found that addition of up to 0.25 per cent of potassium nitrate has no appreciable effect on flavor, texture, or color of processed cheese. The flavor is affected by larger additions. The nitrate addition has a definite deterrent effect upon the organisms producing fermentation, which is however, subsidiary to that of temperature. If cheese is processed below 140° F., the nitrate is of little use, but at 145° to 160° F. additions of 0.1 to 0.5 per cent appear to be definitely helpful.

Rubber-Plastics Mixtures for Electric Cables Praised

A mixture of rubber and high-grade plastic material gives good results in the electric cable industry, according to S. W. Melsom before the Transmission Section of the Institution of Electrical Engineers. Polyvinyl chloride is being employed for extreme conditions, as insulation and as a protective sheath over the vulcanized insulated core. Another plastic material is used as a constituent in a gas type of cable, and styrene is being developed for supertension joints. As far as the prospects in the impregnated paper cable field are concerned, Mr. Melsom doubted if anything would take the place of paper for low-pressure cables because of cost. The same factor is preventing use of synthetic rubbers for cables.

Fluorescent Oil Used for Deciphering Charred Documents

A new method for deciphering charred documents, timely because of fire damage by air raids, was described by Julius Grant to the Society of Public Analysts and Other Analytical Chemists. The document is impregnated with a mixture of fluorescent oil and petroleum spirit. The oil is absorbed to different extents by remains of the ink, which is modified by chemical reagents if necessary, and the paper. Inspection in filtered ultraviolet light renders the ink visible because of its different degree of fluorescence as compared with the paper. The method has proved satisfactory with a wide variety of papers and inks and gives permanent specimens.

Acetone By-Product Studied as Protein Food for Animals

A by-product from commercial fermentation of cane sugar molasses for acetone production has been studied by the National Institute for Research in Dairying as a possible protein food for pigs or poultry. About 7,000 tons of this material, said to contain 60 to 65 per cent crude protein and resemble dried yeast in appearance, are running to waste each year.

Maximum Benzene, Toluene Recovery Made Compulsory

All gas and coke-oven undertakings with benzene recovery plants must work for the maximum recovery of benzene and toluene under a general direction issued by the Board of Trade. Maximum home market selling prices have been fixed by the Secretary of Mines for crude and refined naphthalene. Coal-tar distillers are working in accordance with official instructions, and an intensification of control may be expected.

Products Introduced on British Market

Alumina cement for insulating and securing electric heating elements of nickel chromium alloy wound on Vitreosil furnace lines is now supplied by a British producer.

A new red rubber color, claimed to be of exceptional fastness to light, stable to all conditions of vulcanization including sulfur chloride cures, and entirely nonbleeding in rubber, has been put on the English market.

British airplane engine manufacturers will soon be supplied with lubricating oils obtained in a plant for the reclamation of used lubricating oils. Capacity of this plant, first of its kind in England, will be 15,000 tons a year.

Sisal Plant Considered as Chemical Raw Material

Difficulties in procuring hemp and Manila have drawn attention to possibilities of increased use for sisal, produced in large quantities in Tanganyika and Kenya. The fiber is now used to a growing extent for "curing" in roadmaking operations, insulation of cables, filtration, and fiberboards for building. Sisal enters into laminated plastics and bitumen-lined paper. Fibers extracted from the plant, however, represent only 3 per cent of the total plant. While it may be possible to raise that figure to 5 per cent, experiments have been conducted on commercial utilization of the large amount of the plant which is at present waste or used only for fuel or fertilizer. The most promising fields are the manufacture of industrial alcohol and paper.

Improved methods of decortication have been developed, but these await the return of peace for practical application. Sisal has not hitherto suffered from the competition of synthetic fibers which generally lack the strength of the sisal fiber, but the new synthetic fibers of the nylon class may encroach on the sisal market.

Export Plans for Plastics Shelved

British producers of plastics are fully engaged on war work, and plans for an export drive had to be canceled. Some time ago the Plastics Export Group, at the request of the Board of Trade, prepared a catalog of moldings suitable for export. Over 400 articles were illustrated, and 15,000 copies were printed. Because of the change in policy these have been held back, and exporters have been instructed that they cannot proceed with the export plans while the war lasts. Shipments of molding powders are now restricted to such small quantities as will be used in overseas countries, chiefly the British Dominions, for purposes essential to the British war effort.

G. ABRAHAMSON

150 HALFWAY ST.
SIDCUP, KENT
December 1, 1941

Swedish Government Encourages Production of Sulfite Alcohol

UNDER government stimulation Swedish production of sulfite alcohol probably will total 30,000,000 liters in the last half of 1941, the first half having seen an output of 22,000,000, according to a report to export-import authorities in Washington.

In addition to a program of encouragement to the industry generally, the Swedish Government has recently subsidized construction and operation of three new sulfite alcohol plants, which are expected to be in operation during the coming summer, with an annual capacity between 1,000,000 and 1,500,000 liters each.

Besides the licenses granted these plants, the authorities have approved, up to last October, all applications for erection of new sulfite alcohol production facilities. With the three mentioned, there will be 32 such plants in operation in Sweden. With these and expansion of facilities at older plants, the industry is expected to attain an output of approximately 70,000,000 to 75,000,000 liters of sulfite alcohol, with an alcohol content by volume of 95 per cent, per year. This represents a 100 per cent increase of production capacity over 1939.

Spain Ships Argols and Tartaric Acid to U. S.

DESPITE war conditions, reports confirm that Spain has continued to make large shipments of argols and tartaric acid to the United States, declared exports from Barcelona in October showing 286,660 pounds of argols, valued at $68,446; tartaric acid, 17,837 pounds, of $11,038 value; and cream of tartar, 44,092 pounds of $20,750 value.

Tartaric acid exports are viewed by officials as particularly significant, inasmuch as only very small amounts have

been imported by the United States the past two years, the entire year's figure for 1940 being 2,205 pounds, of $508 value, and for the first three quarters this year, 7,164 pounds, valued at $3,866.

Spain is of secondary importance as a source of argols and wine lees, to this country at least; however, quantities shipped amounted to 19,935,274 pounds valued at $3,405,236; and cream of tartar, 44,423 pounds, of $14,427 value, for the first three quarters of the year.

Brazilian Perfume and Cosmetic Imports Limited to U. S. Products

BRAZILIAN imports of perfumes and cosmetics are limited to American products, a report to export-import authorities in Washington declares, pointing out that Brazil has developed its industry to a point where it is even exporting some products, many of which are of good quality.

The range of production in Brazil is indicated by the following summary of 1941 output: lotions, cologne water, etc., 6,000,000 bottles; talcum powder, 30,000,000 boxes; liquid and solid rouge containers, 10,000,000; glasses of brilliantine, 10,000,000; perfumed oils, 10,000,000 bottles; and toothpaste, 12,000,000 tubes.

Most goods carrying American, French, and British trade names are manufactured in branch factories in Brazil, it was pointed out.

Peru Imports Large Per Cent of Arsenate from U. S.

PERU imported 2,171,339 gross kg. of calcium arsenate, sulfates, and other compounds used in insecticides and fungicides from the United States, out of a total of 2,315,431 kg. of such products brought in during 1940, the U. S. Department of Commerce indicates. With the Peruvian sol at approximately 16 cents, the value of these imports was 1,468,061 sols of United States purchases of a total of 1,600,851 sols during 1940.

Calcium arsenate is used in Peru in large quantities as an insecticide on cotton plantations. It has to a large extent replaced lead arsenate since 1927 when an American company initiated airplane dusting for cotton fields in that country. Arsenic also is used in sheep dip preparations.

Netherlands Indies Imports of Carbon Disulfide from U. S. Gain

UNITED STATES exports of carbon disulfide to the Netherlands Indies amounted to 25,100 pounds, valued at $2,650 in 1940, compared with 5,500 pounds, valued at $320 in 1939 with demand contingent on prevalence of certain insect pests, according to a report received in this country.

Annual demand varies from 2.5 to 30 metric tons, it was stated. The United States and Europe, including Germany, were pre-war sources.

England Puts Fertilizer Use and Sale under New Control

USE and sale of fertilizers in England are under a new fertilizer control order administered by the Ministry of Supply. The order provides for acquisition by firms of compound fertilizers under authority of Phosphoric Acid Fertilizer Certificates issued by an agricultural executive committee. This will ensure ability to purchase for delivery further ahead than 60 days.

Agriculturalists can now purchase potash for growing sugar beets, root, and vegetable crops grown for seed under contract, in addition to potatoes, onions, carrots, flax, and tomatoes. The procedure for obtaining potash has not been changed, however, and the available quantity is still governed by the supply situation.

Netherlands Indies Munitions Project

FIRST steps to produce locally certain important munitions had just been taken by the Netherlands Indies when the Japanese attack on the Malay area occurred, reports indicate. The Netherlands Indies Chemical Works, Inc., first of the necessary plants, was formed in September, with government help of 1,650,000 guilders in a total paid-up capital of 5,000,000 guilders, with a prospective total of 10,000,000 guilders to be expended for such enterprises. Ammonium sulfate, gunpowder, and TNT are to be produced. What the present invasion by Japan has done to these projects has not been stated.

British India Imports Calcium Cyanide in Quite Large Amounts

CALCIUM cyanide has a variety of important uses in British India, a trade survey reports, and consequently that country imports rather large quantities, primarily from Great Britain and the United States. Health departments and municipalities use it extensively in plague control, especially in Bombay and southern India, while tea estates in Assam likewise use quantities.

Two British distributing concerns with offices throughout India virtually control the business, one firm handling the British product and the other a well-known American brand.

Chlorine under Control in Canada

CANADIAN authorities have recently inaugurated control of distribution, use, and consumption of chlorine in that country, it is reported through official channels. The step was taken to meet increased demands from Canada's war industries.

The control order exempts chlorine for bacteriological purposes, pulps with not less than 90 per cent alpha-cellulose content, dissolving pulps, nitrating pulps, and pulps in which chlorine is a processing rather than bleaching material.

Larger quantities are in demand for producing smoke bombs, flares, and other war supplies, and its industrial reduction will affect the brightness of some grades of paper, it is indicated, as has been the case in the United States.

Sodium and Potassium Dichromate Production Is Stimulated in India

WAR-TIME demand has stimulated production of sodium and potassium dichromates in India, the country having available a supply of chromite ore, it is reported in a recent trade document received in this country.

Four medium-sized plants, having a total output of about 150 tons per month, are reported, with expansion contemplated for several small plants now with a capacity of about 5 tons each. However, the development is viewed as primarily a war-born activity, with considerable technical improvement necessary, if the production is to compete with foreign products in the post-war period.

Local Phosphate Rock Used on Netherlands Indies Plantations

TROPICAL plantations growing rubber, oil palms, and tea have found in phosphate rock produced in the Netherlands Indies a satisfactory natural fertilizer, when properly selected and ground. It is more economical than superphosphate, according to Import-Export authorities. Practically the entire output is consumed locally.

Actual production figures are not available, but are reliably estimated at 33,113 metric tons in 1938 and 18,777 tons in 1939. Probable annual production is around 30,000, with consumption between 10,000 and 40,000 metric tons.

Turkey Sets Up Credit to Pay for Sulfur Imports

THE Turkish Government, reported to be taking special steps to ensure a sulfur supply, has allotted a credit of 500,000 Turkish pounds to a semigovernmental bank for importation of sulfur from abroad.

Imports through this source will be distributed to consumers at less than cost, in line with Turkish policy of aiding its agricultural population in every way. The price will be subject to determination by a joint agency of the Ministries of Commerce and Economy, with any resulting loss between cost and sales prices to be made up from government funds.

WITH the United States as the outstanding customer, new records in Argentine casein export volume, production, and prices are expected, according to Export-Import authorities.

POTOMAC POSTSCRIPTS

Priorities and Allocations

PRIORITIES REGULATION No. 1, the basic document which governs the operations of the priority system, has been amended in several important respects, effective December 23, 1941. Most important of the changes is a requirement that all orders bearing a priority rating, including B ratings for essential civilian orders as well as A ratings for defense orders, must be accepted by producers in preference to any unrated order. Previously the acceptance of B-rated orders was not mandatory.

The required acceptance of B-rated orders is a further transitional step in the move toward allocation of scarce materials, since B ratings are one method of designating the relative importance of civilian uses for materials after war requirements have been met. A priority rating of A-10 has been assigned to all defense orders not otherwise rated.

Section 944.14 has been revised to provide a stricter limitation of inventories. Producers were previously forbidden to increase inventories beyond the amount necessary to meet required deliveries; they are now forbidden to accept delivery of materials for inventory in excess of a practicable working minimum.

Other recent activities of the Division of Priorities include:

Methyl Alcohol. Limits on the amounts of methyl alcohol which may be delivered for use as a denaturant for ethyl alcohol, for the production of formaldehyde, and for general chemical manufacture were removed by an amendment to General Preference Order M-31 issued December 19. The purpose of this amendment is to promote these uses for methyl alcohol at the expense of less essential uses.

Restrictions on deliveries of methyl alcohol for antifreeze or general denaturant or solvent uses remain in effect. Orders for methyl alcohol for such purposes are assigned as before a preference rating of B-8.

Chlorine. All chlorine produced in the United States will be subject to direct allocation after February 1, 1942, in accordance with the terms of an amendment to General Preference Order M-19 issued December 20, 1941. Regardless of priority ratings, no producer of chlorine may accept orders after the 10th day of any month for delivery in the next calendar month without a specific direction from the Director of Priorities. No distributor may accept orders after the 5th day of any month without specific direction. All producers are required to file with the Chemicals Branch, Office of Production Management, on or before the 15th of each month on Form PD-191 a schedule of deliveries to be made the following month.

Vanadium. Vanadium was placed under a complete allocation system on December 20, 1941. General Preference Order M-23-a, replacing M-23, provides for monthly requests for allotments and authorizes the Director of Priorities to make monthly allocations without regard to previous preference ratings. Consumers receiving less than 50 pounds per month need not file reports.

Tin. On December 18, 1941, General Preference Order M-43 provided that all supplies of tin shall be subject to specific allocation by the Director of Priorities, no tin may be sold or delivered without specific permission, future imports may not be sold except to the Metals Reserve Company or other government agency, and tin now afloat may not be sold without special permission of the Director of Priorities.

Toluene. All toluene in the United States will be subject to allocation beginning February 1, 1942, in accordance with the terms of an amendment to General Preference Order M-34 issued December 30, 1941. The order will apply to stocks on hand as well as to toluene produced after that date.

On or before January 15, and each succeeding month, every producer of toluene is required to file with the Chemicals Branch of the Office of Production Management his estimated production and scheduled deliveries of commercial grade toluene for the following month. No deliveries may be made after February 1 without authorization from the Director of Priorities, except that deliveries may be made according to the schedule as filed if no word to the contrary is received from the Director of Priorities before the 25th of the month before which the scheduled deliveries are to be made.

Beginning February 1, 1942, at least 70 per cent of the total production of all producers of toluene must be of nitration grade, meeting the requirements of Grade A in United States Army specifications. Deliveries of nitration grade toluene are to be made only in accordance with specific authorization from the Director of Priorities.

The order as amended provides the following ratings for civilian uses of toluene:

Use	Preference Rating
Medicinals and Drugs	B-1
Petroleum Additives	B-2
Dyes and Intermediates	B-3
Rubber Accelerators	B-4
Miscellaneous Organic Chemicals	B-5
Solvents	B-6

The use of toluene as a diluent for protective coatings will be entirely prohibited after February 1, since substitutes are available. Effective immediately, no toluene is to be exported without authorization from the Director of Priorities.

Tungsten Metal Powder, Ferrotungsten, and Tungsten Compounds. General Preference Order M-29, which provides for the control and allocation of tungsten metal powder, ferrotungsten, and tungsten compounds, has been extended six months to June 30, 1942. Supplementary Order M-29-a, which exempts purchasers of 100 pounds or less of contained tungsten in any month from filing reports required of larger users, has been similarly extended. Both orders would have expired December 31, 1941.

Metal Production. With domestic metal production of more vital importance than ever before in American history, the Priorities Division on December 22, 1941, issued a Preference Rating Order designed to assure that the complete cycle, from mining through refining, be completed without interruption.

Of the four steps essential to metal production—mining, concentration, smelting, and refining—the first two are covered by Preference Rating Order P-56, which extends priority assistance to mine operators in the acquisition of necessary maintenance, repair, and operating supplies. Preference Rating Order P-73 provides similar aid to accredited smelters and refiners of copper, lead, zinc, antimony, mercury, and cobalt.

Repair Maintenance and Operating Supplies. Substantial modifications in the OPM provisions governing repair, maintenance, and operating supplies are contained in a new regulation issued December 18, Preference Rating Order P-100, which supersedes Repair and Maintenance Order P-22.

The aim of the new regulation is to extend priority assistance to manufacturers and producers in keeping plants and equipment in good operating condition, and its benefits are not available to retailers as such. It extends priority aid to firms or individuals engaged in manufacturing, processing, fabricating, warehousing, or wholesaling, to various classes of carriers, communications services, persons using tools and equipment to repair or maintain property of producers affected by the order, and various other categories.

Some important changes incorporated in P-100 remove certain restrictions governing inventories, liberalizing provisions in the previous order; and others redefine certain items: operating supplies have been extended to include many minor items of equipment and office supplies except paper products, but to exclude fuel.

The general procedure in using P-100 follows that governing P-22.

Food and Drug Administration to Control Insulin

THE Food and Drug Administration, Federal Security Agency, is now in full control of the purity and standard potency of insulin, following approval by the President of an amendment to the Federal Food, Drug, and Cosmetic Act. The control will be maintained through a system of assay and certification.

This amendment was passed by Congress with record-breaking speed, because the expiration on December 23, 1941, of patents on insulin held by the University of Toronto created a situation fraught with danger to users of insulin. Insulin of standard potency is essential to diabetic patients.

The University of Toronto, through a licensing system and the assaying of each batch of insulin manufactured, has maintained an effective initial control of its purity and potency. With the expiration of the patents, supervision by the university ceased.

Bills were introduced in the House on December 16, 1941, by Representative Clarence F. Lea and in the Senate on December 17, 1941, by Senator Josiah W. Bailey. The House bill was reported by the committee on December 17, 1941, passed by the House on December 18, 1941, and by the Senate on December 19, 1941.

Wholesale Price Indexes

INDEX numbers of wholesale prices for chemicals and allied products in September and August 1941 and September 1940 have been released by the United States Department of Labor. With the year 1926 at 100, the indexes were:

	Sept. 1941	Aug. 1941	Sept. 1940
Chemicals and allied products	87.4	86.0	76.8
Chemicals	88.2	87.5	84.8
Drugs and pharmaceuticals	104.4	100.1	96.0
Fertilizer materials	76.6	75.3	68.1
Mixed fertilizers	77.1	77.1	74.2
Oils and fats	91.3	87.3	39.9

Hormone Manufacturers Fined

THE Department of Justice announced December 17, 1941, the filing in the United States District Court of the District of New Jersey (at Newark) of two consent decrees, together with three informations to which the defendants pleaded *nolo contendere*. Fines totaling $54,000 were imposed.

The informations charged three corporations and five individuals engaged in the manufacture of hormones with violation of the antitrust laws by conspiring with certain European firms to prevent other persons from manufacturing or importing hormones into the United States, with allocating among themselves various countries of the world as markets for the sale of hormones, and with conspiring to establish and maintain arbitrary and noncompetitive prices for the sale of hormones.

Named as defendants were: Schering Corp., Bloomfield, N. J., its president, Julius Weltzien, and its vice president, Gregory Stragnell; Ciba Pharmaceutical Products, Inc., New Jersey, and Vincent A. Burgher, its principal officer; Roche-Organon, Inc., New Jersey, and Elmer H. Bobst, its president; Rare Chemicals, Inc., Flemington, N. J., and E. T. Fritzching, its president.

Price Regulations

A LIST of maximum prices for all grades of **zinc oxides** was published by the Office of Price Administration on December 16, 1941, and became effective January 1, 1942.

Fats and Oils. In connection with the price schedule recently issued for some 1,800 fats and oils, a special study is being made to determine the extent of hardship resulting from imposition of ceiling prices, beginning with cottonseed oil.

Guayule Rubber. The two principal American sellers of guayule rubber—the Intercontinental Rubber Co. and the American Cyanamid & Chemical Corp.—were asked on December 16 to refrain from raising prices above those prevailing on December 6.

Carbon Black. Because cost increases have gone beyond the point where they can be absorbed and because of reduced revenue from export sales, producers of carbon black are being permitted to raise prices by slightly less than 5 per cent above December levels on deliveries made beginning January 1, 1942.

Sulfuric Acid. The Grasselli Chemicals Department, E. I. du Pont de Nemours & Co., Inc., has agreed to continue present prices of sulfuric acid through the first quarter of 1942.

Bleaching Powder. Prices of bleaching powder were stabilized by a series of individual agreements with producers, according to an announcement made December 19, with temporary ceilings 25 cents a hundred pounds more than the 1941 level.

Glycerol. An amendment to the glycerol price schedule, which will aid refiners to get shipments of crude from primary manufacturers was issued December 19 by the Office of Price Administration. Ceiling prices are on a delivered basis for both crude and refined glycerol, with one exception.

Dry Colors. Individual agreements stabilizing prices of dry colors, due to expire January 1, have with minor modifications been extended to April 1, 1942. The agreements have been broadened to include pulp colors, certified food colors, dispersed colors, and similar products.

Export Controls

THE Economic Defense Board, Office of Export Control, has issued Export Control Bulletin No. 4, dated December 15, 1941, announcing strict export control over many miscellaneous materials imported to the United States from the Far East, effective December 23, 1941. The following materials thereafter will be exported under general license only to Canada, Great Britain, and Northern Ireland, Newfoundland, Greenland, Iceland, and the Philippine Islands:

- Camphor, natural
- Cashew nuts
- Cinnamon
- Eucalyptus oil
- Fennel seed
- Kyanite and sillimanite
- Lemongrass oil
- Mace
- Magnesite
- Menthol, natural
- Oilcake and oilcake meal
  - Cocoanut
  - Hempseed
  - Soybean
- Patchouli leaves
- Patchouli oil
- Pepper
- Fayllium seed
- Sago, crude and flour
- Sandalwood
- Sandalwood oil
- Senna
- Sesame seeds
- Tapioca

Existing general licenses also have been amended to limit exportation to the same destinations only of certain animal, fish, and marine mammal oils, fats, and greases; antimony, chrome pigments, some types of chromium, rice, refined sugar, tea, iron, and steel, vegetable oils and fats; wool, certain rubber goods, and numerous other articles and materials.

Price Quotations on Industrial Alcohol No Longer Permitted

INDICATIONS of a freezing move by OPA in connection with industrial alcohol, butanol, and acetone were seen in a request from that agency to producers of these commodities to refrain from quoting prices for delivery after January 1, until further word from Washington. These products already are under price ceiling, and the action was explained as necessary "pending completion of steps to ensure stability in the market for these products in the light of new conditions created by war".

American Cyanamid Co. Directed to Cease Employee Interference

THE National Labor Relations Board on December 15 announced an order to the American Cyanamid Co., Brewster, Fla., to cease discouraging membership in United Phosphate Workers Union No.

22036 (AFL), or any other labor organization of its employees, by transferring, discharging, laying off, or refusing to reinstate any employee because of his membership in the above or any other labor organization of its employees.

Ferrochromium Specifications

ALL American manufacturers of ferrochromium on December 16, 1941, voluntarily agreed to changes in specifications which will permit the use of lower grade chrome ores and conservation of higher grades.

Present specifications of 68 to 69 per cent chromium, 4 to 6 per cent carbon, and 1 to 2 per cent silicon will be changed to 60 to 63 per cent chromium, 6 to 8 per cent carbon, and 4 to 6 per cent silicon, by the agreement.

The agreement affects the type of ferrochromium used in making engineering steels running up to about 3 per cent chromium and does not affect stainless steel and heat-resistant alloy steels in which a larger amount of chromium is used.

U. S. Imports of Sodium Chlorate Dwindle

SODIUM chlorate imports by the United States have dwindled from 7,000,000 pounds in 1929 and 1937, and an annual average of 3,000,000 pounds in the past 16 years, to 2,600 pounds representing the sole imports for the first three quarters of this year, it is reported through export-import sources here. The year's imports were from Canada and occurred in July.

Formerly France, Germany, and Sweden were the principal suppliers of this country from abroad, but today manufacture of the product by United States plants supplies the bulk of the country's needs. Domestic production has increased since 1928. However, until recently, only one plant, located at Niagara Falls, N. Y., has accounted for United States output. Beginning this month, a new plant at Portland, Oreg., will further expand American resources of sodium chlorate.

War Halts Essential Oil Experiments in Philippines

OUTBREAK of the Japanese war and attacks on the Philippines, with hazardous communication between the islands and this country, probably will halt any benefits from recent moves in the islands to increase plantings of essential oil plants.

The islands grow a number of plants, but not in sufficient quantities in any one locality to assure a constant supply for production of essential oils. Many of them yield only small quantities of such oils, and then in very short seasonal periods, making production expensive and probably unprofitable.

However, at the outbreak of war, the Bureau of Plant Industry had been increasing its plantings of citronella grass, and had plans for installing a small distillery. In fact one such installation already had been made, but a further problem of interesting firms in commercial production had arisen. In progress at the time were attempts to increase ylang-ylang oil production by a commercial distiller and experiments in commercial production of oil from patchouli roots and cinnamon bark.

Philippines Carry On Successful Quinine Production

QUININE production in the Philippines, which has been in progress experimentally on some 850 acres, is apparently successful, the U. S. Department of Commerce reports.

This area produces approximately 6,000 pounds of cinchona bark annually which a government chemical plant manufactures into a drug, totaquina, used to combat malaria. Annually this disease causes 16,000 deaths in the islands.

After experiments in various parts of the Philippines, cinchona plantations are now restricted to a province on the island of Mindanao, where the combination of elevation, soil, and climate seems best suited to the trees. Under cultivation are 1,300,000 cinchona trees. Since 1933 more than 50,000 pounds of locally grown bark have been delivered for processing, in addition to 30,000 pounds in storage in a government warehouse. The quality of this bark is said to compare favorably with that produced in the Netherlands East Indies.

Tariff Commission at Service of EDB

FACILITIES of the U. S. Tariff Commission will be at the service of the Economic Defense Board during the war, according to Vice President Henry A. Wallace, chairman of the board, and Raymond B. Stevens, chairman of the U. S. Tariff commission. Before the outbreak of war with Japan, the commission was acting as a research organization for the Economic Defense Board in gathering and analyzing data on the maximum supply of certain strategic and critical materials which may be imported from foreign countries in the next two years. The work, begun in October at the request of the board, is well under way.

This move strengthens the facilities recently made available to the Economic Defense Board through similar arrangements with the Department of Commerce and the Coordinator of Inter-American Affairs.

THE first eight months of 1941 saw a 5 per cent decline, from $8,355,800, to $7,949,000, in Philippine imports of chemicals and like products. The drop is attributed chiefly to a sharp decline in fertilizer and fertilizer material imports.

U. S. Imports of Sodium Cyanide Set New High

UNITED States imports of sodium cyanide, all from Canada, received in the first nine months of 1941, exceeded all previous records for any year in the past 15, it was reported by official sources in Washington recently. Total 1941 imports from this source so far reported amount to 52,315,900 pounds, valued at $2,065,700, which compares with the previous year's imports of 50,410,500 pounds, hitherto the record, and the previous low, in 1932, of 17,584,600 pounds.

Used in extraction of gold and silver from their ores, as flotation agents for separating ores, fumigation, electroplating, and heat-treating metals, and manufacture of various chemical substances, it is an important industrial commodity in the United States, where only a few concerns produce it. Some exports from this country are reported, but are less than import figures.

Dyestuff Firms Indicted

A FEDERAL Grand Jury, sitting in the Southern District of New York (New York City), December 19, 1941, returned three indictments charging three corporations and seven individuals engaged in the dyestuff, film, and chemical industries with violation of the Sherman Antitrust Act and the Wilson Tariff Act.

Named as defendants were: General Aniline & Film Corp., Dietreich A. Schmitz, former president and director, William H. vom Rath, former secretary and director, Hans W. Aickelin, vice president and director, Ernest Schwarz, vice president in charge of the Agfa-Ansco Division, and F. William von Meister, general manager of the Ozalid Division; General Dyestuff Corp. and E. K. Halback, president and director; I. G. Farbenindustrie A.-G. and Hermann Schmitz, president.

The first indictment charges that General Aniline, General Dyestuff, and I. G. Farbenindustrie agreed to combine all their dyestuff properties in the United States into a single manufacturing company and not to compete otherwise in the manufacture or sale of dyestuffs in this country except through General Dyestuff Corp. Under this agreement, General Dyestuff was to act as exclusive sales agent for all dyestuffs manufactured by General Aniline, the latter also agreeing not to export dyestuffs from the United States unless authorized to do so by the I. G. F. The second indictment has to do with films and photographic materials, and the third with photoprinting materials and apparatus.

Howard B. Bishop, Summit, N. J., is head of the recently organized Kotal Co., which has acquired the business of the Asphalt Treatment Corp.

Three new assistants to J. F. McNamara, Monel sales manager, have been announced by The International Nickel Co.: **W. J. Calnan, H. D. Tietz, and E. A. Turner. H. E. Searle,** formerly an assistant to Mr. McNamara, has been transferred to the Nickel Sales Department.

C. G. Carter, president of the Liquid Carbonic Corp., has been elected chairman of the executive committee of the company. **P. F. Lavedan,** vice president, has been made president, and **J. H. Pratt** becomes executive vice president.

Howard E. Fritz, who for the past seven years has directed the development and sale of Koroseal, one of the Nation's newest synthetic materials, has been named director of research of the B. F. Goodrich Co., Akron, Ohio. Dr. Fritz went to B. F. Goodrich in 1925 from the engineering school faculty of Ohio State University, where he was graduated in 1914 and where he received his doctor's degree in 1921.

G. A. Jorquera, professor of agricultural chemistry in the School of Chemical Engineering, University of Concepcion, Chile, is spending the academic year 1941–42 at the Oregon State College as a Phi Kappa Phi fellow. He is engaged in work leading to an advanced degree in chemistry and chemical engineering.

John G. Kura has been named to the technical staff of Battelle Memorial Institute, Columbus, Ohio, and assigned to metallurgical research.

First lieutenant Floyd E. Kurtz, who has been Assistant Post Chemical Officer at Fort Meade, Md., since December 1, 1941, has been transferred to the Post Chemical Office at Fort Belvoir, Va.

Stanley M. Matelski, Jr., has been transferred from Edgewood Arsenal to the Office of the Chief of the Chemical Warfare Service, Washington, D. C., and has been assigned to the Industrial Service, Priorities and Labor Relations Section.

The retirement this month of **James W. Schade,** director of research for the B. F. Goodrich Co., since 1925, has been announced. One of the best known technical men in the rubber industry, Mr. Schade joined the company in 1909 as a chemist. He assumed direction of technical work in the footwear department and in 1919 became manager of the department. In 1922 Mr. Schade was selected to direct the operation of the company's testing laboratories and three years later was named to his present position.

E. A. Turner

E. A. Turner, for more than 15 years in charge of Monel and rolled nickel sales in the chemical and associated fields for The International Nickel Co., New York, N. Y., has been appointed assistant to the sales manager. **C. J. Bianowicz** succeeds Mr. Turner.

Roy C. Newton Honored

ROY C. NEWTON, vice president in charge of chemical research, Swift & Co., Chicago, Ill., was placed in the hall of fame of his alma mater, Oklahoma Agricultural and Mechanical College, in special ceremonies commemorating achievements of alumni, December 15. The occasion was part of a 3-day observance of the 50th year of the founding of the college.

Dr. Newton, member of the Swift & Co. chemical research staff since 1924, received his bachelor's degree from Oklahoma A. and M. College in 1921, having served in the A. E. F. as a second lieutenant in 1917–18. Wounded during the war, he holds the Croix de Guerre with one star. Following his graduation, Newton served as assistant chemistry instructor at the college, and later taught at Purdue University and Lewis Institute.

The citation giving Dr. Newton the honor said, in part:

Dr. Newton, through a rare combination of scientific and executive skill, has built for his company a research department that has contributed hundreds of improved forms of food and food by-products to the use of mankind. His personal research has contributed many valuable processes to the food industries.

Standing as he does at the meeting grounds of agriculture, science, and business, Dr. Newton exemplifies the combination in one person of those skills which it is the purpose of the land-grant college to impart; and hence it is fitting that we recognize him today as one of Oklahoma A. and M. College's outstanding graduates.

Haering Personnel Changes

RECENT personnel changes of D. W. Haering and Co., Inc., include the promotion of H. C. Daggett, formerly eastern division manager, to the position of general sales manager; appointment of Nat Bailey, formerly chief chemist of the Waukegan Coke and Chemical Co., as research chemist in Chicago; and addition of Tom Palen and Jarvis Johnson, chemists in the Chicago Service Laboratory. Dyer B. Lake has been placed in charge of the New York Service Laboratory, F. H. Wright has been made manager of the Chicago Winchester Avenue unit, and O. R. Borngosser placed in charge of the Wichita Service Laboratory. D. R. Walser has been promoted to Chicago district managership, C. E. Erb to Wichita district manager, and E. H. Snyder to Houston district manager.

George Perry has been appointed West Coast manager, P. A. Dobson is now in charge of Los Angeles, Calif., territory, and Joseph Paulson is in charge of Portland, Ore., and surrounding area. G. Knight-Smith has been placed in Dallas, Tex.; E. M. Lloyd, in Baltimore, Md., Walter Beschenbossel, in Minneapolis, Minn., and R. C. Rohrdanz, superintendent of the Shelley Refining Co., has returned to active service for Haering in the Houston, Tex., territory.

Frank W. Mrazek has been placed in charge of New Orleans, La., and W. S. Nathan has been added to the Milwaukee, Wis., staff. C. French and G. Conrow have been added to the Chicago service staff. W. F. Renner of Red Springs, N. C., has been placed in charge of North Carolina operations.

Spies Receives Manufacturing Pharmacists' Award

FOR pioneer work with vitamins that has cut the hidden hunger death rate from 50 per cent to 0, Tom Douglas Spies, of the University of Cincinnati School of Medicine and Hillman Hospital, Birmingham, Ala., received the Award of Distinction of the American Pharmaceutical Manufacturers' Association on December 8. Dr. Spies was among the first to use nicotinic acid to save patients dying from pellagra and has since studied the role of other B vitamins in the treatment and prevention of disease.

The award is made each year to a scientist who, in the opinion of an advisory committee, has made a fundamental contribution to public health in the field of drug therapy. Last year's award went to Perrin Long, of Johns Hopkins School of Medicine, for his study of the use of the sulfa drugs.

Perkin Medal to Martin H. Ittner

THE Perkin Medal for 1942 was presented January 9 to Martin H. Ittner, of the Colgate-Palmolive-Peet Co. at a joint meeting of the American Section of the Society of Chemical Industry, the New York Sections of the AMERICAN CHEMICAL SOCIETY, American Institute of Chemical Engineers, and Electrochemical Society, and the Société de Chimie Industrielle. Lincoln T. Work presided. Sidney D. Kirkpatrick, editor of *Chemical and Metallurgical Engineering*, spoke on the personal side of the medalist's life and Foster Dee Snell, president of Foster D. Snell, Inc., on his technical accomplishments. The medal, which is awarded annually by the American Section of the Society of Chemical Industry for outstanding work in applied chemistry, was presented by Marston T. Bogert, following which Dr. Ittner gave an address on "Forty-five Years of Chemistry in a Soap Plant".

For almost 45 years Dr. Ittner has been in charge of research at Colgate-Palmolive-Peet Co. or predecessor companies. Among his many contributions is the development of a successful commercial process for the hydrogenation of fatty oils, on which he has been granted a number of patents. He has also made valuable contributions in the field of distillation and he holds several recent patents pertaining to new processes for glycerol production and fatty acid distillation. He holds patents for the counter-current hydrolysis of fats with water to fatty acids and glycerol.

Who Makes It?

THE following acids, which need not be Schering-Kahlbaum preparations but should be of equal purity, are needed in 25- to 100-gram quantities by Marshall W. Mead, Department of Chemistry, Franklin College, Franklin, Ind.

Ethyl malonic	Benzyl bromomalonic
Benzyl malonic	Tribromoacetic
Heptyl malonic	Allyl acetic
Isopropyl malonic	Ethyl succinic
Methylethyl malonic	Phebyl propiolic
Dipropyl malonic	α-Chlorocrotonic

A NEW regulation on essential oils, just reported from Jamaica, states: "No person shall make, manufacture, produce, purchase, or sell, or cause to be made, manufactured, produced, purchased, or sold, any oil made, manufactured, or produced from bitter, bitter-sweet, or sour oranges."

Cincinnati Gives Chemical Engineering Lectures

A LECTURE series on Recent Trends in Chemical Engineering is being conducted by the Department of Chemical Engineering of the University of Cincinnati. Each program is preceded by a subscription dinner. Saul B. Arenson, professor of inorganic chemistry, has charge of arrangements.

Lectures which have been presented are Chemistry and Chemical Engineering in the Printing Industry by Robert F. Reed and Paul W. Dorst, Modern Chemical Engineering by R. S. Tour, and a Symposium on Microbiology of Chemical Interest with Mrs. E. K. Moore discussing Bacterial Friends and Foes of the Tanner and Furrier and Harry C. Fisher speaking on The Microbiology of Paper as a New Specification.

Future speakers, who are University of Cincinnati graduates and faculty members, and their subjects are:

SUBJECT	SPEAKER	DATE
Alloys from Powdered Metals	John F. Kahles	Jan. 22
Newer Tools in Chemical Engineering		Feb. 17
Ultraviolet Light	Francis M. Sell	
Some Fundamentals of Industrial Instrumentation	Selig H. Isaacs	
Progress in the Brewing of Beer	George Sipple	March 20

Defense Training Course

NEARLY 85 per cent of the men who have graduated from the course in the Chemistry of Powder and Explosives at Purdue university since last spring are now employed in the field of munitions. Applications are being accepted for the next course which opens on the campus, at Lafayette, Ind., January 26. This is a full-time, intensive course, six days a week, for six weeks.

The establishment of several new ordnance-manufacturing and powder-loading plants in the Midwest will require thousands of additional skilled workers. Satisfactory completion of this defense training course qualifies the student to act as explosive inspector for the Government or as operator and inspector in manufacturing plants. Passing the course is tantamount to passing the Civil Service examination for inspector of powder and explosives. The course is rated as one year of experience on this examination.

The applicant must have had at least two years of college chemistry, including one year of organic chemistry. The one year of organic is required regardless of the number of years of chemistry a student may have had. There is no tuition, the cost of supplies, supplementary teaching material, and instruction being met by federal funds supplied through the U. S. Office of Education. Students, however, are required to buy their own books and pay for transportation and subsistence.

The course is taught by George T. Austin, School of Chemical and Metallurgical Engineering, assisted by Lloyd Berg and Herschel Hunt. Persons interested should write to Harry Short, district representative, defense training program, Purdue University, Lafayette, Ind., giving a list of chemistry courses which the applicant has completed and the grades received.

Fellowships Established to Increase Knowledge of Nutrition

THE National Live Stock and Meat Board will place grants and establish fellowships through the National Research Council for the purpose of increasing the present knowledge of nutrition.

The grants may be made for either fundamental or clinical research on the nutritional properties of meat, meat products, and animal fats, and the importance of these nutrients to human health and welfare.

This fund, limited in amount, will become available on July 1, 1942. Applications will be received until March 1, 1942. Application blanks may be obtained from the Division of Biology and Agriculture, National Research Council, 2101 Constitution Ave., Washington, D. C. In addition to a statement of the problem and research plan or program, the committee in charge desires information regarding the method of attack proposed, the institutional support which will be given the investigation, and the uses to be made of the sum requested. No part of a grant may be used by the recipient institution for administrative expenses.

Licenses Required for Explosives

DECLARATION of a state of war makes effective the Federal Explosives Act of October 6, 1917, which prohibits the manufacture, distribution, storage, use, or possession of explosives, or the ingredients of explosives, unless a license has been obtained from the Director of the U. S. Bureau of Mines. Exempted are explosives used by the Army and Navy.

NECROLOGY

Howard Salisbury Evans

HOWARD SALISBURY EVANS, aged 65, died of a heart attack at his home in Pittsburgh, Penna., December 14, 1941. He had spent the greater part of his business career in the glass manufacturing industry.

Mr. Evans' first association with the glass industry was when he entered the employ of the Thomas Evans Co., of which his father was president. The firm, a pioneer Pittsburgh institution, was engaged in the manufacture of lamp chimneys. When the Evans and MacBeth interests were merged into the MacBeth-Evans Glass Co. in 1899 Mr. Evans became associated with that firm, and upon the death of his father in 1923 was advanced from vice president to president of the company. Mr. Evans continued as president until 1926 when he retired. He was also one of the founders of the Diamond Alkali Co., Pittsburgh, and a member of its board of directors.

William L. Lippincott

WILLIAM L. LIPPINCOTT was born in Hornell, N. Y., October 12, 1893, and died from a heart attack December 1, 1941. Graduated from Cornell University with the degree of bachelor of chemistry in 1918, after one year of graduate work at Cornell University he went to Clemson College in the fall of 1920. During the first World War and prior to his graduation, Professor Lippincott served as a sergeant in the Sanitary Corps and was stationed at Camp Wadsworth, Spartanburg, S. C.

During the first four years at Clemson College, Professor Lippincott was research chemist with the S. C. Experimental Station, as well as professor of analytical and physical chemistry. As the enrollment of the chemistry courses increased, the course in analytical chemistry required his full time.

Besides his instructional duties, for many years he served as faculty adviser and coach of the college glee club. Largely through his efforts in organizing a club among the students majoring in chemistry, which eventually resulted in establishing a chapter of Alpha Chi Sigma, the national professional fraternity was installed at Clemson College in 1938. He acted as faculty adviser from the time of its organization to his death.

Alexander Lowy

ALEXANDER LOWY, professor of organic chemistry in the University of Pittsburgh, died December 25, 1941, after an illness of about four months.

Dr. Lowy was born in New York City, March 31, 1889. He obtained his bachelor of science degree from Columbia University in 1911, the master of arts in 1912, and the doctor of philosophy in 1915.

Dr. Lowy was assistant in electrochemistry in Columbia University from 1912 to 1915. He taught in the high schools of New York City from 1915 to 1918, when he became professor of organic chemistry in the University of Pittsburgh, with which he was associated until the time of his death. During the past summer he was exchange professor in the University of Southern California. Dr. Lowy was the holder of numerous United States patents. He was a recognized authority in the field of protective chemicals, having invented methods for the safeguarding of banks and vaults. He also made important contributions in the field of dyestuffs and was a pioneer in electro-organic chemistry, to which he contributed numerous researches.

Dr. Lowy with Benjamin Harrow was the author of "A Textbook of Organic Chemistry", which is in use in over 125 colleges and universities in America and has gone through many revisions. A companion volume is "A Laboratory Manual of Organic Chemistry" with Wilmer Baldwin. Dr. Lowy was a coauthor of Rogers' "Industrial Chemistry" and contributed the chapter on organic chemistry. Alone and with his research students he was the author of over 70 research reports and scientific papers which have appeared in technical journals since 1919.

Dr. Lowy was a member of the AMERICAN CHEMICAL SOCIETY and a past chairman of the Pittsburgh Section. He was a member of the Electrochemical Society, its vice president from 1930 to 1933 and from 1939 to 1941, and chairman of its Committee on Publications from 1931 to 1941. He belonged to the honorary science societies Sigma Xi and Phi Lambda Upsilon and was an honorary member of Sigma Alpha Mu fraternity.

In the summer of 1929, Dr. and Mrs. Lowy visited England and continental Europe, where Dr. Lowy made a study of the universities and industrial establishments. He lectured extensively and addressed many of the sections of the AMERICAN CHEMICAL SOCIETY. It was as a teacher that Dr. Lowy reached his pinnacle. No effort was too great to provide what was best for the student. He was exacting in performance but tolerant of the individual's difficulties and ever willing to lend a hand and help, not only in studies but in private problems. In the University of Pittsburgh he was a member of important committees and was faculty chairman of registration.

J. S. Marlowe

J. S. MARLOWE, district representative for the Jessop Steel Co., Indianapolis, Ind., died November 2 from a cerebral hemorrhage. He was 60 years old. Mr. Marlowe had sold steel and steel products in the Indianapolis district for 35 years, during the last 20 of which he represented the Jessop Steel Co.

Charles Rudisel Park

CHARLES RUDISEL PARK, in charge of the Bulletproof Tank Division of The Firestone Tire and Rubber Co., Akron, Ohio, was fatally injured on December 11, 1941, in an explosion which occurred in the Parkway Restaurant, near the Firestone plants. He died in a local hospital several hours later.

Mr. Park was born in Tiffin, Ohio, August 21, 1894. He attended Heidelberg College and Cornell University, receiving the A.B. degree from the latter in 1916. After doing graduate work and serving as assistant in chemistry at the University of Minnesota (1916–17), he was instructor at Massachusetts Institute of Technology from 1917 until August 1922. He then joined the research staff of the Goodyear Tire and Rubber Co. in Akron. He was engaged in development work on carbon black for the Delano Land Co. from 1926 to 1928 and returned to research work at Goodyear in 1928. From 1930 to 1931 he was chief chemist of the United Carbon Co., and then became a member of the research staff of The Firestone Tire and Rubber Co., where he held the positions of research chemist, head of the division of physical chemical research, and assistant director of research. He became manager of the New Products Division of Firestone, March 1, 1938, and was placed in charge of the Bulletproof Tank Division June 1, 1941, in which capacity he was serving at the time of his death. He was the author of publications on the physical properties of rubber compounds, effects of powders in the reinforcement of rubber, and temperature effects during vulcanization.

Mr. Park was a member of the AMERICAN CHEMICAL SOCIETY (1917), having served the Akron Section as Secretary, Chairman, and Councilor, the American Institute of Chemical Engineers, the American Institute of Chemists, and Alpha Chi Sigma fraternity. His hobbies were gardening and music, and he was active in the civic affairs of his community, being a member of the City Council of Silver Lake, Ohio. He was a member of Akron Torch Club and the Akron Friends of Music.

He is survived by his wife, Kathryn, one son, John, age 15, of Silver Lake, Ohio, and his mother and sister of Tiffin, Ohio.

High Polymeric Reactions. Their Theory and Practice. *H. Mark* and *R. Raff.* 476 pages. Interscience Publishers, Inc., 215 Fourth Ave., New York, N. Y., 1941. Price, $6.50.

THIS book is Volume III of a series—Volume I related to the collected papers of W. H. Carothers on "High Polymeric Substances", and Volume II on "Physical Chemistry of High Polymeric Systems".

The scope of the volume, which is divided into two parts, may be indicated by the table of contents. Part 1, General, comprises (*A*) The Structure of High Polymers, (*B*) Some Data on Experimental Methods, (*C*) The Fundamentals of Reaction Kinetics, and (*D*) The General Theory of the Mechanism of Polyreactions; Part 2, Special, (*A*) Polymerizations, (*B*) Polycondensations.

Under *A* in Part 1 the authors classify polymers as having chain, net, and space configurations; for example, the chain polymers include substances such as rubber, cellulose, and silk, while the net and space polymers include substances which form rings in two or three dimensions such as the synthetic resins. In this same section the authors discuss some fundamental concepts such as homopolar covalence and properties of this type of linkage, both from the classical and the quantum mechanical viewpoints. Under Section *B* of Part 1 various experimental methods are presented, including the determination of specific properties both physical and chemical. Section *C* gives a rather complete discussion of fundamental reaction kinetics, including the various orders of chemical reactions, reaction rates, and activation energy. In Section *D* the general theory of the mechanism of polyreactions is discussed. The authors assume that such reactions take place either in steps or according to a chain mechanism. They also developed equations for the rate of formation of polymers. A considerable number of algebraic equations have been presented for the rates of chain reactions, and the authors have discussed the nature and function of the double bond in polymerization reactions. In Special Part 2, Section *A*, the authors review the experimental work on polymerization in the literature with reference to a large number of compounds, including olefins, diolefins, acetylene and its derivatives, and other types of compounds. Section *B* of Part 2 deals with polycondensations, which differ from polymerizations in that the combination of the primary constituents is made up by splitting off simple molecules such as H_2O, NH_3, and HCl. The formation of polyglycerols and glyptals (reaction between phthalic anhydride and glycerol) are examples of these types of reactions.

The book contains 436 pages of text and has a large number of references and a systematically arranged author and subject index. It is well written and has a sound theoretical and practical basis. The subject is timely.

J. C. MORRELL

Analytical Chemistry of Industrial Poisons, Hazards, and Solvents. *M. B. Jacobs.* 661 pages. Interscience Publishers, Inc., 215 Fourth Ave., New York, N. Y., 1941. Price, $7.00.

THE book is a useful text for students of industrial hygiene, industrial and preventive medicine, although perhaps somewhat large to be used in its entirety as a college textbook.

The author, through 134 pages, deals with the classification of the industrial poisons and the sampling of gases. In these 134 pages, many instruments for sampling are described, proper credit being given to the individual designers as well as to the manufacturers of the sampling devices. It is a thorough and all-inclusive introduction.

The chapters following describe the chemical and microscopical examination of dust with a critical analysis of the various methods. The author describes not only the various known chemical methods of analysis, but the relative toxicity of various compounds. The methods described for one particular toxic substance, for example, lead, are many. The lead sulfide method is outlined, then the diphenyl-carbazide estimation, the dithizone method, and the electrolytic separation of lead; determination of lead, also when the lead is present in the form of a true vapor or gas as is the case with tetraethyl lead, is given.

Some methods have their limitations, for instance, pyridine; the recommended determination consists of back titration of the consumed 0.1 *N* sulfuric acid by the pyridine. If other alkaline vapors, such as ammonia, are present in the air this determination fails and would have to be modified. No mention is made of this.

The chapter on chemical warfare agents and their determination is particularly recommended. The work is thorough and deserves a space in the library of physiological chemists, plant chemists, and physicians interested in industrial hygiene.

NICHOLAS M. MOLNAR

Chemical Engineers Handbook. *John H. Perry,* Editor-in-Chief. 2nd ed. 3029 pages + xviii. McGraw-Hill Book Co., 330 West 42nd St., New York, N. Y., 1941. Price, $10.

THE second edition of the Chemical Engineers Handbook is similar in appearance to its eight-year-old predecessor which it exceeds in size by some 400 pages. The general plan and content are exactly the same, each section or subject has been written by one or more contributors and more than 90 individuals are responsible for the 29 sections.

In the preface the editor-in-chief states that all sections except four have been rewritten or thoroughly revised. Those four are Mathematics, Factors in Chemical Plant Location, Accounting and Cost Finding, and Reports and Report Writing. Perry also states that the following new material has been added: a table of physical and chemical properties of inorganic chemical compounds, and a table of gages for wire and sheet metal; sections on solvent extraction; shotting, granulation, flaking, sprays and spraying; bulk packaging; and sublimation. There are new chapters on Thermodynamics; Mechanical Separations; and Pipes and Tubing.

Several physical features should be corrected. The handbook is extremely difficult to read: first, because type size is small (though this is to be expected), and second the paper readily transmits the illustrations and text on the underlying page. This condition existed in the first edition but it seems more pronounced in the present offering. Halftone cuts are the chief offenders in this respect and should either be discontinued in favor of line drawings or the handbook printed on heavier paper and divided into two sections as exemplified in Kent's Mechanical Engineers Handbook. When a book approaches 3.25 inches in thickness, as does this volume, it ceases to be a handbook as originally defined and ought to be made more convenient for the user.

It is impossible to comment on the accuracy of the technical data or even to have an opinion on every section, and it is unfair to single out individual offerings.

However, in all technical writings, accuracy depends on the competence of the author and Perry has done a masterful job in assembling a group of qualified men to write, advise, and criticize.

New Crops for the U. S. A.

A BULLETIN recently published by the National Farm Chemurgic Council, 50 West Broad St., Columbus, Ohio, discusses United States imports as possible new crops for experimentation and large-scale domestic cultivation. After an introduction by Wheeler McMillen, president of the council, and a preface by Robert T. Willkie and Paul J. Kolachov, the authors, the bulletin lists 131 imports, with 23 literature references to the subject. The bulletins are 25 cents each.

Journal of Chemical Education for January

THE *Journal of Chemical Education* for January 1942 contains the following articles among others:

LIU-SHENG TS'AI. A Transparent Phase Rule Model.
EVA V. ARMSTRONG AND CLAUDE K. DEISCHER. Johann Rudolf Glauber (1604–70), His Chemical and Human Philosophy.
HARVEY A. NEVILLE. Synthetic Resins and Plastics.
HAROLD F. SCHAEFFER. The Iodoform Reaction by Methods of Microscopy.
ALEXANDER SILVERMAN. Stoichiometric Calculations on the Basis of Crystal Lattices.
DOROTHY BARTON. Edwin Emery Slosson, a Chemist of the West.
H. A. SPOEHR. Origin and Transformation of Carbohydrates in Plants.
W. F. LUDER. Acids and Bases, Their Relationship to Oxidizing and Reducing Agents.
A. L. KUEHNER. Monomolecular Film Demonstrations.
W. H. DORE. Calculation of the Valence Angle.
J. W. GREENE, A. L. OLSEN, AND W. L. FAITH. A Laboratory Course in the Chemistry of Powder and Explosives.
M. G. MELLON AND D. R. MELLON. Problems of Teaching Quantitative Analysis. II. Students' Laboratory Records.
PHILIP F. WEATHERILL. The Valence Angle of the Carbon Atom.
R. H. BOGUE. Portland Cement and the "Plastic" Concrete.
J. A. V. BUTLER. John Maclean, Charles Macintosh, and an Early Chemical Society in Glasgow.
J. HERBERT WARD. An Experiment in Chemistry Teaching.

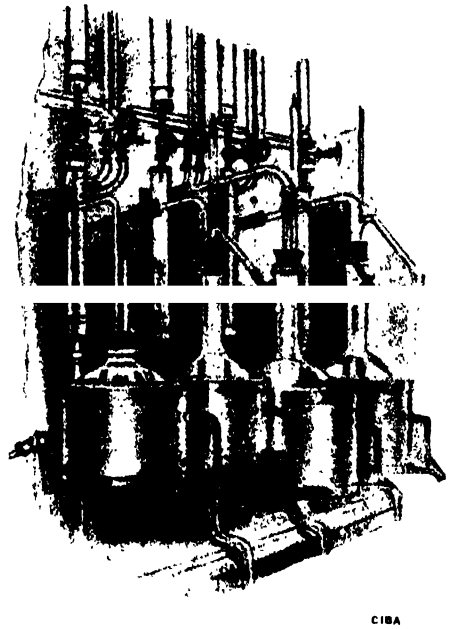
Chemical Reviews for December 1941

THE December issue of *Chemical Reviews* contained the following papers from the Symposium on Reactions and Equilibria in Chemical Systems under High Pressures, which was held under the auspices of the Division of Physical and Inorganic Chemistry at the 100th Meeting of the AMERICAN CHEMICAL SOCIETY, Detroit, Mich., September 9 to 13, 1940:

R. E. GIBSON. Introduction to the Symposium.
L. H. ADAMS. Equilibrium in Heterogeneous Systems at High Temperatures and Pressures.
BENTON BROOKS OWEN AND STUART R. BRINKLEY, JR. Calculation of the Effect of Pressure upon Ionic Equilibria in Pure Water and in Salt Solutions.
R. WIEBE. The Binary System Carbon Dioxide–Water under Pressure.
H. H. STORCH. Chemistry of Coal Hydrogenation.
W. B. KAY. Some Peculiarities in the *P–T* Border Curves of Mixtures of Hydrogen and a Petroleum Naphtha.
ALLEN E. STEARN AND HENRY ERYING. Pressure and Rate Processes.
L. J. GILLESPIE. Thermodynamic Calculations of Pressure Effects in Gaseous Reactions by the Equation of State Method. A Brief Review.

This issue also contained a paper by H. B. Hass and Elizabeth F. Riley, The Nitroparaffins.

Bibliography of Nomographs Dealing with Acids and Alkalies



THE following references are drawn from "A Bibliography of Chemical Engineering Nomographs", 84-page Document 1599, compiled by Roy Myllynen and D. S. Davis of Wayne University and filed with the American Documentation Institute, Science Service Building, 1719 N St., N. W., Washington, D. C. It is obtainable on microfilm for $1.04 or in photocopies readable without optical aid for $8.60.

The references given here do not include titles listed under the headings of Vapor Pressure and Viscosity.

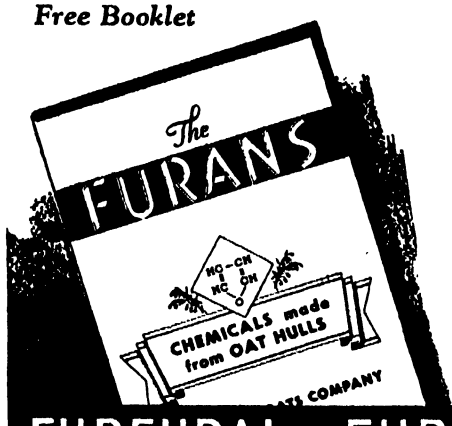
5 WAYS to MAKE RESINS

1. Furfuryl Alcohol + mineral acid
2. Furfuryl Alcohol + acidic salts
3. Furfuryl Alcohol + heat (reflux)
4. Furfuryl Alcohol + water + heat (reflux)
5. Furfuryl Alcohol + Furfural + acids

Furfuryl ALCOHOL

The Furans

FURFURAL
FURFURYL ALCOHOL
TETRAHYDROFURFURYL ALCOHOL
HYDROFURAMIDE



Coating compositions, heat-setting binders, and cements are being made successfully from Furfuryl Alcohol resins. The coatings based on the resinification with acids possess much resistance to corrosive substances including nearly all mineral acids and alkalis. By control of the kind and amount of catalyst and temperature one may form thermo-setting resins.

Other uses for Furfuryl Alcohol are based on its solvency for dyes and resins. It finds use as a penetrant and flotation agent intermediate. Here are typical properties:—

Specific gravity	1.130 (25/25°C)
Boiling point	167–77°C(95%)
Flash point	75°C (open cup)
Surface tension	38.2 dynes/cm.
Color	Yellow to amber

Write for a test sample of Furfuryl Alcohol and ask for your copy of the free booklet describing all the Furan compounds. A word concerning the nature of your company's interest will help us to supply pertinent data.

Left. Running a test on cellulose acetate material in laboratory at Derby, Conn.

Below. A general view in Farrel-Birmingham's testing laboratory at Derby, Conn.

Farrel-Birmingham Opens Testing Laboratory

To aid industry in the development of new processes and materials, Farrel-Birmingham Co., Inc., Ansonia, Conn., has expanded the testing facilities at its Derby plant by completely re-equipping the laboratory that has operated there for some years. It is not intended to compete with established commercial laboratories, but is operated solely to help the company's customers develop new products or improve old ones, with the view that expanded use of these products will create a greater need for the machinery built by the company.

The new laboratory was started about August 1, 1941. Since that date an average of three independent companies a week have made use of the testing facilities. Many experiments have been performed with such materials as rubber, synthetic rubber, various kinds of plastics, such as cellulose acetates, resinous compounds, and phenolic condensation products, asphaltic materials, linoleum, cellulose products, paints, and enamels. Many of the more recent formulas for plastic articles have been developed. Production-size machines as well as experimental machines have been installed so that, when formulas are developed and tested on a laboratory scale, tests can be completed at once in the same size machines used for production. Users of the laboratory have complete privacy, and secret processes or formulas need not be disclosed. Schedules are so arranged that no two clients are there at the same time.

The main room is 36 feet wide by 90 feet long. With the exception of the lower part of the walls and floor, the entire interior and the machinery are painted white, providing good lighting under most daytime conditions. Fluorescent lamps give bright illumination when artificial light is necessary.

The machinery includes a size 3-A Banbury with two-speed drive so that it can be operated at speeds of 34 and 68 r. p. m. The Banbury is mounted over a 22 by 48-inch heavy-duty, two-roll mill, which can be used for sheeting out the stock from the mixer or for other milling operations. An elevator and conveyors carry materials from the main floor to the operating platform of the Banbury mixer. Next to the Banbury mixer and sheeting mill installation is a tilted refiner with 21- and 24-inch by 36-inch rolls. This machine is driven by an individual motor and arranged to operate at either 20 or 61.44 r. p. m.

The experimental size equipment consists of two laboratory Banburys—a size B and a midget; a 6- by 13-inch two-roll mill; a 6- by 13-inch three-roll calender; a 3-inch plasticator, and an 8- by 8-inch hand-operated hydraulic press with electrically heated plates.

A 15-horsepower, automatic, gas-fired boiler provides steam pressure to a maximum of 150 pounds per square inch. Laboratory scales with metric graduations, portable scales of 1,000-pound capacity, tables, stock bins, shelves, and cupboards make the laboratory equipment complete for handling the materials being processed.

Outside the main laboratory another room has been provided for storage of both raw and processed materials.

American Drug Firm Launches Latin American Campaign

Inauguration of an economic war against Nazi control of the drug trade in Latin America has been announced by Sterling Products (Inc.), American manufacturer and distributor of drugs, pharmaceutical supplies, and allied products.

The drive was launched in Mexico with the largest sales and advertising campaign ever undertaken in that country. The campaign is to be extended to other Central and South American countries, under direction of 60 men trained for foreign commercial service, through Sterling's subsidiaries, the Sydney Ross Co. and Sterling Products International, Inc. Personnel of these companies is largely Latin American.

Surveys show that until recently Germany controlled 75 per cent of the Latin American drug business; the United States only 20 per cent. The remaining 5 was divided among Great Britain, Italy, Japan, and others. The German organization is strongly intrenched with large stocks of drug supplies on hand.

SYNTHETIC RESIN PLYWOOD ADHESIVES

TEGO-UFORMITE AMBERLITE

The development of resin-bonded plywood over the past ten years is one of the less-heralded, but none the less spectacular, accomplishments of synthetic resins, and one which is still in the early stages of growth. It would be a gross understatement to say that this development has resulted merely in a greatly improved product, for it has actually brought about a revolution in plywood. This is true not only from the standpoint of *production*, where the advantages of the resin bonding process are immediately apparent, but also from a standpoint of *design*, since engineers have been provided with a new structural material.

The cornerstone of this development was TEGO Resin Film, a thin sheet of a special phenol formaldehyde type resin which, under heat and pressure, yields plywood proof against boiling water, mold, heat, and freezing. TEGO Resin Film still remains the outstanding quality adhesive, with millions of square feet being used today in aircraft and marine plywood alone. For example, the United States Navy patrol torpedo boats make wide use of TEGO-bonded plywood in their construction.

TEGO was followed by the urea formaldehyde adhesive, UFORMITE, widely used in the manufacture of furniture and radio cabinets where it has proved far superior to older type adhesives under extreme service conditions. UFORMITES of various types have been evolved for use in both hot and cold pressing of plywood, replacing casein and animal and vegetable glues in many applications.

Recently, AMBERLITE PR-14, AMBERLITE PR-23, and AMBERLITE PR-28, water-soluble phenol formaldehyde powders, have been developed to meet the adhesive needs of the Douglas Fir plywood industry on the one hand, and molded plywood, as typified by the so-called plastic plane, on the other. Interest in these products is not limited to their use in plywood manufacture. For example, AMBERLITE PR-28, created to meet the need for a phenol formaldehyde adhesive curing at the relatively low temperatures required for rubber-bag techniques, represents an entirely new type of resin, possessing wide possibilities as a binder in a variety of applications.

Literature which describes in detail the properties of synthetic resin adhesives and their application in the plywood field is available upon request and our technical staff will gladly discuss special problems without obligation.

OTHER DEVELOPMENTS OF THE RESINOUS PRODUCTS LABORATORY

Ion Exchange Resins

The use of synthetic resins as ion exchangers—developed in the laboratories of the Department of Scientific & Industrial Research, in Great Britain—represents the newest field of application of synthetic resins. The Resinous Products & Chemical Company, sole licensee for the United States under basic Holmes and Adams patents, is now producing these resins. Their use on a commercial scale, both for the softening of water and the removal of cations and anions as salts from solutions is now being widely investigated.

Synthetic Resins in the Coatings Industry

More than fifteen years ago, AMBEROLS (modified oil-soluble phenol formaldehyde resins) paved the way for the modern, quick-drying varnishes. Since then, DURAPLEX alkyd resins, UFORMITE urea formaldehyde resins, and ACRYLOID polymers of acrylate and methacrylate esters have extended the use of synthetic resins in paints, varnishes, lacquers, printing inks, coated fabrics, and floor coverings.

Resin Emulsion Paints

Six years ago, work was begun on the development of alkyd resin emulsions as clear coatings, primers, and in pigmented form—as paints. This emulsion, AQUAPLEX, is now in wide use as the base of an entirely new type of paint.

The Paraplex Family of Resins

The PARAPLEX resins are a unique class of the alkyd-type resins. They are tough, rubbery products of varying degrees of softness and are outstanding resin plasticizers for nitro-cellulose and ethyl-cellulose. Special forms are adapted for use in caulking and sealing compounds and in the modification of synthetic rubber.

Versatile Urea Formaldehyde Resins

UREA formaldehyde resins are proving to be the most versatile of the synthetic resin types. Produced as dry water-soluble powders, as aqueous solutions, as modifications soluble in ethyl alcohol and butyl alcohol, octyl alcohol and hydrocarbons, these resins are finding a widening use as plywood adhesives, in the treatment of textiles and paper and in baking finishes for wood and metal.

Complete Technical Advisory Service

Upon request, interested chemists will promptly receive technical literature on any of our products. In addition, a member of the Resinous Products' trained technical staff will consult with chemists on proposed applications of any of our products. This service, which includes the facilities of the Resinous Products Laboratory, is offered without obligation. Write today, stating what cooperation you would like us to render.

THE RESINOUS PRODUCTS & CHEMICAL COMPANY
WASHINGTON SQUARE, PHILADELPHIA, PA.

Wanted—Defense Production Inspectors

THE latest examination announcement to come from the U. S. Civil Service Commission is for inspector positions in the Defense Production Protective Service of the War Department. Salaries range from $2,600 to $5,600 a year. Applications will be rated as soon as possible after receipt at the U. S. Civil Service Commission, Washington, D. C.

The title "Inspector, Defense Production Protective Service" implies the urgency of this examination. These inspectors will be responsible for making recommendations to prevent interruptions or delays in the production and delivery of all types of defense material when these interruptions may be caused by major accidents, explosion, or other hazards inherent in manufacturing plants. No written test will be given. Applicants will be rated on their education, experience, and personal qualifications. The requirements are:

(*a*) General experience in performing inspectional and professional engineering advisory services for manufacturers, as inspector in a property insurance rating bureau, as plant protection supervisor or master mechanic in a large industrial establishment, or as professional engineer specializing in plant protection work.

(*b*) Chief and principal inspectors ($5,600 and $4,600 a year) are also required to have had responsible administrative experience not necessarily in connection with plant protection inspections.

Provision is made for substituting appropriate college study for part of the prescribed experience.

Although applications will be accepted until further notice, qualified persons are urged to apply at once. Copies of the announcement and application forms may be obtained at any first- or second-class post office or from the Civil Service Commission, Washington, D. C.

Types and Sizes of Drums for Liquids Reduced

THE chemical industry has accepted specific recommendations of the Manufacturing Chemists' Association covering extensive reductions in sizes and types of metal barrels and drums for liquid products during the national emergency. These recommendations are that:

Single-trip drums for liquid chemicals be restricted to the 5- and 55-gallon sizes.

Returnable drums (12- to 16-gage) for liquid chemicals be restricted to the 10-, 20-, 30-, and 55-gallon sizes. Four specific sizes are stipulated because of Interstate Commerce Commission requirements for specific hazardous liquids such as bromine and hydrofluoric acid.

Shippers specify a wall thickness not heavier than 13-gage for 110-gallon aqua ammonia drums and not heavier than 14-gage for 55-gallon drums on future orders.

No further orders be placed for 110-gallon drums, except in the case of aqua ammonia.

Freezing of Gas Pipe Lines Investigated

FREEZING" of natural-gas pipe lines in cold weather by the formation of snowlike compounds called "gas hydrates" is being investigated by the U. S. Bureau of Mines through temperature surveys of certain western pipe lines, according to a report submitted by R. R. Sayers, director of the bureau.

The bureau in cooperation with the American Gas Association is seeking to eliminate gas-hydrate obstructions in the pipe lines, thus contributing to national defense by permitting an uninterrupted supply of this vital fuel to cities and industries far removed from gas fields.

Bureau chemists established temperature-reading stations on a 340-mile natural-gas pipe line extending from the Texas Panhandle gas fields to Denver, Colo., and control stations where temperatures were recorded at the surface and at various depths to a maximum of 10 feet below the ground level. Measurements for nearly 4 years showed that the temperature of the gas in the pipes generally approximated the temperature of the ground at the depth of the center of the pipe.

Hand operation of hoist and carrier on straight line process system.

WRITE FOR Blue Book illustrating hundreds of MonoRail installations

PUT your floor space to better use by putting your carrying jobs overhead. Eliminate floor congestion. Relieve your men from lifting and carrying—they'll accomplish more by giving their full time and skill to production. These are but a few of the benefits derived from American MonoRail Equipment.

At no obligation an American MonoRail Engineer, through long experience, may be able to show you how to speed up your production.

Announcing——

a departure

to meet the needs of today and tomorrow, National Oil Products Company departs from its long-standing policy of producing only natural-source vitamin products, and announces the first of its synthetic vitamins:

Calcium Pantothenate Dextrorotatory-Nopco

Pharmaceutical and food manufacturers who desire to increase the pantothenic acid activity of their products will find Calcium Pantothenate Dextrorotatory-Nopco a dependable source of this B Complex factor.

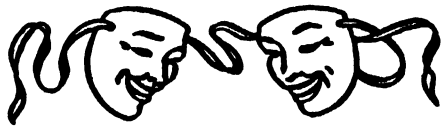
Natural Gas Consumption

THE marketed production, or consumption plus exports, of natural gas in 1940 reached the highest peak ever recorded, according to the U. S. Bureau of Mines. This was partly due to an increased demand by defense industries, although the largest gain was recorded in the oil and gas fields for drilling, pumping, gas lift, and operating natural gasoline and recycle plants. The total production was 2,660,222,000,000 cubic feet, an increase of 7 per cent over the peak recorded in 1939. The consumption of natural gas reached a new peak of 2,654,659,000,000 cubic feet, also 7 per cent over 1939.



The average value of natural gas at the wells decreased from 4.9 cents in 1939 to a new low of 4.5 cents per 1,000 cubic feet in 1940. The average value at points of consumption increased 0.1 cent and was 21.7 cents.

Glass Carboys Standardized

THROUGH efforts of the Container Standardization Committee of the Manufacturing Chemists' Association, all members of the chemical industry have agreed to specify only 13-gallon boxed glass carboy bottles for transportation of acids and other corrosive chemicals. Previously approximately 70 per cent of new carboy production has been of the 13-gallon standard M. C. A. type, the balance of the 12-gallon type.

Owing to unprecedented demand for acids and other liquid chemicals needed by defense industries, requirements for additional carboys greatly exceeded productive capacity.

Universal adoption of the 13-gallon carboy will increase by 8 1/3 per cent the volume of liquid shipped per container and add to the productive capacity of the carboy bottle plant by at least 10 per cent through elimination of lost time and breakages necessitated by size changeovers.

EMANATIONS

Pyrometry—by Wood and Cork

THE book on Pyrometry, written by Messrs. Wood and Cork and reviewed on page 1370 of the NEWS EDITION for 1941, has appealed to one of our readers as an example of appropriate names that has tickled his funny bone.

The Chemist and His Ken

How open-mouthed with wonder
The people hearken when
The Chemist turns his thunder
On things within his ken.

"Oh, marvel of the ages,
Oh, cynosure of men",
The people say, "How sage is
The Chemist in his ken".

Alas, it often follows
The Chemist swells up then,
And passionately bellows
Of things beyond his ken.

The people blink and wonder
At this rare catechumen,
"The Chemist, too, can blunder
When strayed beyond his ken?"

Let's draw the saving curtain;
Repent, and say "Amen",
His punishment is certain
Who strays beyond his ken.

BERZELIUS BEAKERTONGS

GAST ROTARY AIR PUMPS

ANHYDROUS ALUMINUM CHLORIDE

in

ORGANIC CHEMISTRY

By

CHARLES ALLEN THOMAS
Central Research Director, Monsanto Chemical Company

In collaboration with
Mary Baluk Moshier, Herbert E. Morris and R. W. Moshier
Thomas and Hochwalt Laboratories,
Monsanto Chemical Company

American Chemical Society Monograph No. 87

This volume has been eagerly awaited for some time by all those concerned with the catalysis and isomerization of organic compounds. The reactions of aluminum chloride with hundreds of compounds are discussed in detail; and a feature of the book is the presentation of the exact changes which occur in structure. A résumé of the work of Friedel and Crafts, who did the pioneer work in this field, is included. This is indeed a monumental compilation which will be invaluable to research workers in the fields of petroleum, plastics, rubber, synthetic coatings, flotation agents, dyes, fats and waxes, cleansing and dry-cleaning agents, perfumes and textiles.

990 Pages **Illustrated** **$15.00**

Notice!

Owing to manufacturing difficulties the publication date of the new third edition Condensed Chemical Dictionary, completely revised, has had to be advanced from January 15, 1942 to January 31, 1942

Because of this postponement we will continue to accept orders at the prepublication price of $10.00 up to January 31, 1942. Thereafter the list price of $12.00 will be strictly maintained, subject to usual trade discounts.

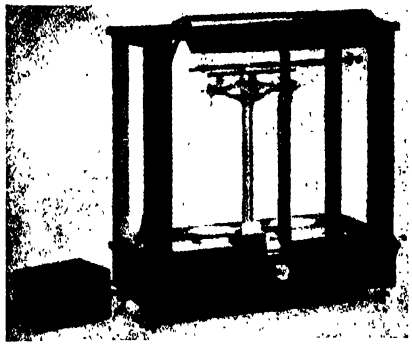
PHENOMENA AT THE TEMPERATURE OF LIQUID HELIUM

***by* E. F. Burton, H. Grayson Smith *and* J. O. Wilhelm,**
Dept. of Physics, University of Toronto

THE FIRST BOOK ON THIS INTRIGUING SUBJECT!

It is of the greatest importance for both physicists and chemists to be familiar with the peculiar action of matter at excessively low temperatures. An understanding of the modern phases of low-temperature research requires discussion of the means of the producing low temperatures and of measuring both the temperature and the properties of the substance involved, as well as a general presentation of experimental results already obtained. This fundamental material is given in the early chapters.

The essence of the book is found in the latter half where are presented the results of the impact of curious low-temperature phenomena on modern theories of matter, the nature of superconductivity, the behavior of specific heats and magnetic properties of matter and the freakish antics of liquid helium below 2° K. Particular attention has been given to the definition and measurement of temperature, and to the intriguing problems of the approach to the absolute zero.



The experimental work discussed in this timely book was performed at the McLennan Laboratory in Toronto, one of the best equipped physical laboratories in the world! The authors are pioneers in low-temperature research, and their work will be of the greatest interest to chemists, physicists, engineers and metallurgists.

CONTENTS—Historical Introduction. The Liquefaction of Gases. The Measurement of Temperature. The Physical Properties of Liquid and Solid Helium. Superconductivity. Specific Heats at Low Temperatures. Magnetic Properties. Temperatures Below 1° K. Electrical and Thermal Conductivities. The Nature of the Superconducting State. The Transformation in Liquid Helium and the Nature of Helium II. Appendixes. Author Index. Subject Index

CHICAGO, ILLINOIS

Visirecord Card Index System

Tenite strips replacing aluminum in card index are cut in lengths to fit vertical edges of divider cards and once snapped and riveted into position serve to support and protect the cards. Indexes and subdivisions can be identified quickly by using different colored Tenite strips.

THE Canadian munitions industry has delivered over 150,000,000 pounds of finished explosives, and in 1942, it is said, will reach an output of 70,000,000 pounds per month of chemicals and explosives, with complementary materials.

Valdura Black-Out

A BLACK-OUT paint for darkening windows and skylights of industrial and commercial properties, where it would be impractical to extinguish lights at the sound of an air-raid warning, is announced by American-Marietta Co., 43 East Ohio St., Chicago, Ill.

The paint had been undergoing development in the company's laboratories for several months with the thought that it might find application in some outlying United States possessions. Final tests were speeded with the Japanese attack on United States possessions in the Pacific, and commercial production started 10 days later. First shipments were made to distributors on the Pacific, Atlantic, and Gulf Coasts.

The paint is being marketed in paste form, and, when cut 50 per cent with water, can be sprayed or brushed on windows to prevent all passage of light. Coverage is 800 square feet to the gallon. It dries within 40 minutes, providing a flat surface that will not flash back or glare when hit by artificial light used within the room. In interior applications, a single coat may be covered with a white paint where large glass surfaces make the higher reflection properties of a white surface necessary.

Removal of the product, termed Valdura Black-Out, is made without damage to the glass. It is being packed in 1- and 5-gallon containers.

Processing Machine for Aluminum Alloys

A TWO-STRAND, cross-rod conveyorized Detrex processing machine has been designed by the Detroit Rex Products Co., 13005 Hillview Ave., Detroit, Mich., for the cleaning and treatment of metal parts. It follows an approved U. S. Army and British procedure for the treatment of aluminum alloy sheets used in aircraft to make them less pervious to the effects of air and to provide a better paint bond. This machine incorporates hot alkali wash, hot water rinse, hot chromic acid dip, hot water rinse, and oven dry off. It has the advantages of a compact self-contained unit that eliminates special handling systems and tanks spread out over a large floor space.

Rubber Swimming Pool Paint

UNTIL recently the amount of rubber that could be introduced into paint was very small. With a better knowledge of the proper treatment of rubber to fit it for painting requirements, it has been possible to develop paint which is really based on rubber.

The research chemists of the Truscon Laboratories, Detroit, Mich., have produced a paint known as Paratex, suitable for concrete. Because of its toughness of film, waterproofness, resistance to weathering, Paratex provides the type of protective and decorative coating for outside pools that concrete swimming pool owners or operators have been seeking.

Service Pins for Employees

A TOTAL of 8,810 years of service will be recognized by Standard Oil Co. of Indiana by presentation of gold pins to 501 employees during the first six months of 1942.

Eight will be awarded pins for 40 years' service each; 41, 30 years; 274, 20 years; and 178, for 10 years.

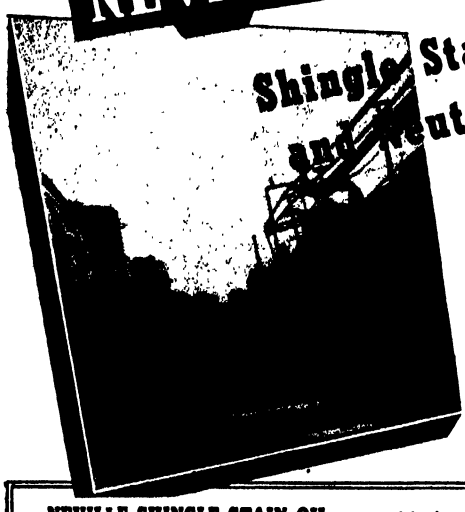
MORE PEOPLE SAY "EASTERN" For HUSKY MIDGET PUMPS

Every day new applications are discovered for this amazing line of pumps.



Eastern Midget Pumps for Every Use

*Open impeller centrifugal, or positive displacement (1½ to 9½ gallons per minute. Maximum pressures from 3 to 35 lbs. per square inch).
*High speed Universal or non-sparking induction motors (1/100 to 1/3 H.P., A.C. or D.C. models in standard or special voltages).
*Air driven, belt driven or Underwriters' approved explosion proof units also available in midget sizes, and in various metals and alloys.
*Sizes as small as 4½" long × 2¾" high × 2½" wide.
*Weights 2¾ lbs. to 14 lbs.
*Metals and alloys to fit the needs of any application.
*Prices from $9.50 up.

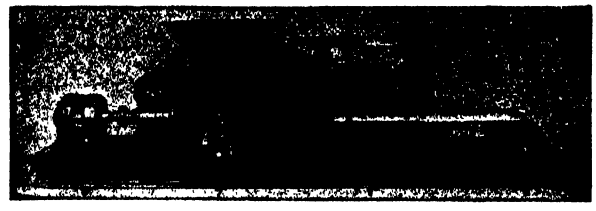
Write for Booklet describing complete line of 8 basic models.

EASTERN ENGINEERING COMPANY
41 Fox St., New Haven, Conn.

NEVILLE

CLEAR, clean dark red oils. Non-corrosive and of low volatility

NEVILLE SHINGLE STAIN OIL is suitable for thinning low cost high-baking japans. It is an excellent vehicle for pigmented shingle stains.



NEVILLE NEUTRAL OIL serves as cut-back solvent for tars, asphalts, and other bitumens. Important as inexpensive vehicle for tar acids, or cut-back solvent for tar acid oils, in manufacture of emulsifying-type coal-tar disinfectants, cattle and sheep dips.

• *Inquiries solicited for drums and tank cars. Send for complete brief leaflet "Neville Coal-Tar Products."*

THE NEVILLE COMPANY
PITTSBURGH • PA.

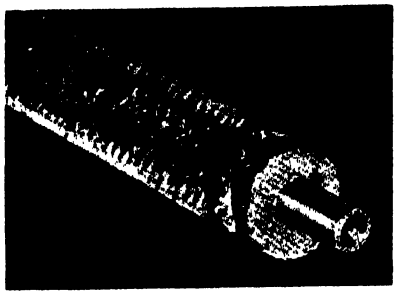
A BLENDER A MIXER
AND UNEQUALLED IN ITS EXACTNESS

THE AUTOMATIC FEEDER-WEIGHER-CONVEYOR

Schaffer Poidometers will proportion or feed your bulk material automatically with a high degree of accuracy. They are now being used for proportioning of feeding materials in the following industries—Cement, Process, Ceramic, Oil Refining, Feed, Soap, Ore, Gypsum, Lime and many others.

If you are handling a variety of materials, arrange your Poidometers in batteries—set one for each material and for the proportion wanted—then forget it! The Poidometers will do your bidding better than your most loyal employee. If any machine is not getting its full quota of material, the entire battery will automatically stop. Space does not permit of a thorough explanation of the many cost-saving qualities of Schaffer Poidometers.

We are in Chemical Engineering Catalog



Will handle any free-flowing, pulverised, granular or crushed material containing up to 4" cubes.

Install Schaffer Poidometers and Watch Results.

Write for catalog No. 3

SCHAFFER POIDOMETER CO.

New Insulation Product

PROBLEMS encountered in insulating small diameter heating lines on large airplanes have resulted in development of a new product known as Insutube by Union Asbestos & Rubber Co., 1814 South 54th Ave., Cicero, Ill. Light weight, small size, and ability to stay put under severe shock and vibration are listed as features.

The material is made in the form of a seamless braided tube of long fiber asbestos with a wall thickness of 0.5 inch, and is supplied either plain or with a water- and grease-repellant coating.

Electric Condensate Return

ADDITIONS to the line of condensate return and boiler feeding systems are announced by the W. M. Acker Organization, Inc., Cleveland, Ohio, in the form of single and dual electric systems. Adaptable to any conditions in plants operating up to 250 pounds, the single system automatically returns condensate and supplies make-up water to boilers when actuated by mercoid switch at the water column. Make-up water is admitted to the certified A. S. M. E. receiver tank by float-operated valve when condensate reaches a predetermined low level or is insufficient to satisfy the needs of the boiler. The dual system handles high- and low-pressure condensate and make-up water automatically.

Chinaware Decalcomanias by New Process

A NEW process for making chinaware decalcomanias, which substitutes photolithography for hand-lithography in preparing plates from which decalcomanias are printed, has been developed by E. I. du Pont de Nemours & Co., Inc. In the new process, artists' designs are photographed through color filters and reproduced on sensitized metal plates, instead of being tediously stippled by skilled craftsmen on soft stone. The designs are then transferred by use of a special offset lithograph press.

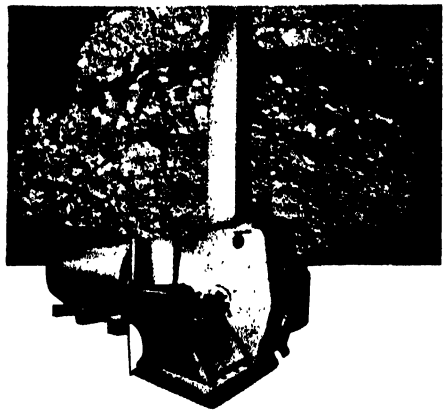
"GOLDEN WEDDING"

BONDED BUILT-UP ROOF



The 35,290 square feet of concrete roof deck of the six-story warehouse, is covered with roof insulation and a 3-ply, CAREY Built-Up Roof, bonded for 10 years.

● Makers of famous products are consistent buyers of other famous products. Accordingly, Jos. S. Finch & Co., Inc., Distillers, Schenley, Pa., selected a CAREY Bonded Built-Up Roof for their six story warehouse No. 15–16. The re-roofing job was done by Frank Limbach & Company, Roofing Contractors of Pittsburgh, Pa.

CAREY Roofs wear longer—cost LESS per year. Whatever your roof problem, put it up to CAREY for economical service. Write for details, address Dept. 64

INVESTIGATE THIS PROVEN DRYING METHOD

The basic principles of heat and agitation are embodied in the Turbulaire Dispersion Dryer. Unlike spray dryers having comparatively small diameter, high speed atomizers, Dispersion Dryers are built in larger sizes with slow speed rotors. The drying medium may be indirect heat, super heated vapor or waste heat. Due to the high temperature differentials, the thermal efficiency of the Turbulaire is especially high. Automatic operation reduces labor costs. The entire process is dustless. Turbulaires handle slimes, pulps and other colloids that cannot be filtered, press cakes, dewatered cake from centrifugals, insecticides, industrial wastes and many technical chemicals.

WRITE TODAY

Get your copy of this latest bulletin on the Turbulaire Dispersion Dryer showing in detail operation, applications and advantages.

[a] Source of statistics in first seven items: Federal Reserve Board.
[b] Preliminary figures.
[c] U. S. Department of Labor.

The December issue of the bulletin of the Federal Reserve Board reported that for the first 9 months of 1941 the earnings, after taxes, of 416 companies were 31 per cent higher than in the first 9 months of 1940. The largest increase was reported in the durable goods field, 40 per cent increase compared to 19 per cent in the nondurable field. In the field of industrial chemicals 25 firms reported profits of $144,700,000 in 1941, compared to $135,200,000 in 1940, or an increase of 7 per cent. In drugs, the increase amounted to 21 per cent and in oil producing and refining, to 46 per cent. The report stated that 122 industrial companies, on which data are available since 1939, set up federal tax reserves during the first 9 months of 1941 equal to 53 per cent of their net before taxes, compared with 17 per cent in the preceding comparable period. The major part of the increase in earnings that has accompanied the defense program has been set aside as reserves to meet federal taxes.

For the period January 1, to November 5, 1941, the American Hard Rubber Co. reports net profit of $525,087 after charges and provision of $500,000 for federal income and excess profit taxes. For the year ended December 31, 1940, net profit was $456,475.

North American's Dallas Plant
DEPENDS ON LAYNE WELLS AND PUMPS

Startling the Nation by going into production just one hundred and twenty days after construction began, the Dallas plant of North American Aviation, Inc., is now rolling out their famous Army AT-6A and Navy SNJ-3 Scout Trainer Planes. Factory and assembly space is completely air conditioned as an aid to accuracy, speed and efficiency in manufacturing.

As was the case with defense projects throughout the Nation, North American chose Layne Wells and Pumps for their water supply. Something over 1,400,000 gallons of water daily is available from their two Layne Units . . . and that capacity can go on day after day, month after month for years to come. In efficiency and dependability Layne Wells and Pumps have no parallel.

When the final chapter of America's greatest war is written, the part played by Layne Wells and Pumps will be a very absorbing story. Certainly in all the world, as hundreds of installations testify, there are no finer Well Water Systems. To meet the country's urgent demand for more and more production you may need more water. Act now! Communicate with Layne. Wire or address,

SYNTHETIC

"DISTILLED" WATER

by chemical treatment

WITHOUT HEAT!

OPERATION — Water passes through two reactor tanks. A chemical reaction in first tank removes positive ions, such as calcium, magnesium, and iron, substituting hydrogen. Water then passes to second tank where the hydroxyl (OH) ion is substituted for negative chloride and sulphate ions, etc. This OH ion then combines with hydrogen to form H_2O. The minerals removed from water are retained in reactor tanks until flushed to drain. Treated water contains small amounts of dissolved carbon dioxide gas which can be dispelled easily by aeration.

1,000 gallons for less than a dollar!

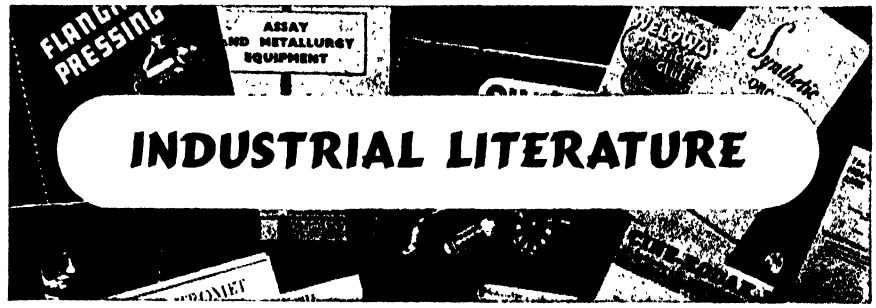
Synthetic "Distilled" water meets all requirements for chemical and industrial purposes. Some of America's largest and best known industries are today relying on ILLCO-STILL units for their "Distilled" water supply.

Completely automatic (between periodic regenerations) — water is not evaporated so no heat is required — pipes will not lime up — minimum maintenance cost. A unit delivering 300 gallons an hour occupies space about 4 x 10 feet. Made of finest material to protect purity of water. Available in units affording from 150 gallons an hour to 5000 gallons an hour.

Investigate the savings and other advantages of ILLCO-STILL as applied to your requirements.

TESTED IN THE LABORATORY · ILLCO-STILL · SYNTHETIC "DISTILLED" WATER · PROVED IN THE FIELD

ILLINOIS WATER TREATMENT CO.



845 Cedar St., Rockford, Illinois

Anglo-Chilean Nitrate Corp. for the fiscal year ended June 30, 1941, shows distributable profits of £373,224, compared with £664,006 for the preceding year. Earnings have been affected by war conditions, which have restricted or completely closed many markets. International money settlements have also been continued with difficulty. Net proceeds are sufficient to pay the 4.5 per cent interest on sterling first mortgage bonds and United States dollar income debentures.

For 16 weeks ended October 4, 1941, the **Mead Corp.** shows net profit of $651,646 compared with $301,665 for the comparable period of 1940. For 40 weeks ended October 4, 1941, net profit was $1,418,004 after taxes, etc., equal after preferred dividends to $1.72 a share on common, compared with $1.02 a share in 1940.

Sherwin-Williams Co. sales for November 1941 are reported as 40 per cent above those for November 1940, while sales in September and October were 31 per cent above the preceding year.

During its fiscal year, ended September 30, 1941, the **York Ice Machinery Corp.** reported an increase of 64 per cent in orders booked over the previous year. Sales completed amounted to 22 per cent more than in 1940. Of the current year's carry-over 63 per cent consisted of orders for national defense.

Listed publications should be requested directly from the company concerned. Use business stationery, mention bulletin numbers, and refer to this journal. Publications will be sent free unless otherwise noted.

Acid Pumps. A 6-page bulletin sums up important operating characteristics and construction features of a pump designed to handle hot and cold acids and other corrosive solutions. The manufacturers point out that the pump has the simplicity and efficiency of a high-grade centrifugal water pump. A rubber base composition is bonded to the cast-iron casing and covering. A soft form of this material can be applied where abrasive particles are carried in the liquid being handled. The pumps are available in 3 sizes, 1.25, 2, and 4 inches. Each type can be furnished with either direct or V-belt drive. *Bulletin 308 IE.* OLIVER UNITED FILTERS, INC., 33 West 42nd St., New York, N. Y.

Boiler Feedwater. This bulletin discusses supplementary treatment of boiler feedwater, feedwater line, that may be necessary after an ordinary external water treatment. Purposes and advantages of the various materials are discussed. Flow-sheet drawings show various hook-ups by which the chemical feeding equipment can be attached to the system. The booklet describes both the proportionating feed and the non-proportionating feed. *Bulletin 2420 IE.* PERMUTIT CO., 330 West 42nd St., New York, N. Y.

Cast Steel Valves. A new 56-page catalog gives complete information on design, dimensions, and metallurgical descriptions of cast-steel stop, check, and stop-check valves. Stop valves are available in sizes for pressures up to 2,500 pounds. Check valves are horizontal, vertical, angle, and "Y" in sizes from 2.5 to 14 inches for all pressures. Engineers will find an interesting section of the catalog supplying current pressure-temperature adjusted service ratings, flange facing information, drawings, and helpful tips on valve usage. *Bulletin 12 IE.* EDWARD VALVE & MFG. CO., INC., East Chicago, Ind.

Chlorination. A series of data sheets is available describing equipment and giving question and answer treatment on protecting water supply with chlorine. This bulletin will be particularly useful where new conditions indicate immediate treatment of water supplies to prevent pollution. *"Stop Gambling With Health" IE.* %Proportioneers, Inc.%, 9 Codding St., Providence, R. I.

Colloid Mills. An interesting 8-page catalog describes the various models in a well-known line of colloid mills. Specification tables and detailed engineering descriptions will help the prospective purchaser make an intelligent decision as to the particular model needed. An interesting feature is a page on a recently developed line of mixers. Three models in this line are designed to handle quantities ranging from 5 to 50 gallon lots of materials. *Bulletin C-41-5 IE.* PREMIER MILL CORP., 110 East 42nd St., New York, N. Y.

Distilled Water. A 4-page leaflet gives an interesting series of photographs of water distillation equipment. The types illustrated range from a small 2-gallon-an-hour still for a research laboratory to a 500-gallon-an-hour unit in a distilling plant. *Bulletin 103 IE.* BARNSTEAD STILL & STERILIZER CO., INC., Lanesville Terrace, Forest Hills, Boston, Mass.

Fabrication of Clad Steel Plate. This excellent technical bulletin gives valuable information on the strength and permanence of bond, mechanical properties, standards of cladding, sizes, and finishes.

Mercury bichloride, cryst., drums, 50 lbs. or more	lb.	2.39
Mercury, flasks, 76 lbs.	flask	212.00
Meta-phenylenediamine, kegs	lb.	.65
Meta-toluylenediamine, kegs	lb.	.70
Methanol, pure, synthetic, drums, frt. allowed, c/l.	gal.	.34½
Tanks, frt. allowed	gal.	.28
Methyl acetate, 97-99%, tanks	gal.	.09½
Chloride, cylinders	lb.	.32
Formate, l. c. l., drums	lb.	.89
Hexylketone, drums, tech., wks.	lb.	.60
Salicylate, drums	lb.	.35
Monoamylamine, drums, c/l., wks.	lb.	.50
Monobutylamine, drums, l. c. l., wks.	lb.	.40
Monoethanolamine, drums, wks.	lb.	.24
Naphthalene, crude, dom., 74 deg., bags, c/l., wks.	100 lbs.	2.50
Nickel salt, single, bbls.	lb.	.13
Niter cake, bulk	ton	16.00
Nitrobensene, drums	lb.	.08
Nitrocellulose, alcohol-sol., bbls., wks.	lb.	.28
Nitrogen solution	unit	1.2158
Octanol, normal, drums	lb.	.85
Oil, castor, No. 3, tanks	lb.	.11½
China wood, dms.	lb.	.36
Coconut, crude, tanks	lb.	.09½
Cod, Newf., bbls.	gal.	.78
Corn, crude, tanks, mills	lb.	.12
Cottonseed, cooking, bbls.	lb.	.15¾
Linseed, raw, tanks	lb.	.1020
Menhaden, crude, tanks, f. o. b. Baltimore	gal.	.60
Neat's-foot, pure, bbls.	lb.	.17¾
Oiticica, bbls.	lb.	.22½
Oleo, No. 1, bbls.	lb.	.13¼
Olive oil, denat., bbls.	gal.	4.00
Edible, Calif., drums	gal.	5.00
Palm, Niger, bbls.	lb.	.09
Sumatra, bulk	lb.	.08
Peanut, crude, tanks	lb.	.13
Perilla, drums	lb.	.22½
Rapeseed, tax incl., bbls.	gal.	.15¼
Red, bbls.	lb.	.12
Soy bean, crude, tanks	lb.	.11¾
Sperm, 38°, bbls.	lb.	.1270
Whale, bbls., natural, refined	lb.	.1070*
Ortho-dichlorobenzene, drums	lb.	.06
Ortho-nitrochlorobensene, kegs	lb.	.15
Ortho-nitrotoluene, drums	lb.	.09
Ortho-toluidine, bbls.	lb.	.19
Para dichlorobensene, drums, c/l.	lb.	.11

Metal slabs, at N. Y.	lb.	.0865
Oxide, Amer., bags	lb.	.0725
Stearate, tech., bbls.	lb.	.30
Sulfate, cryst., bgs., c/l., wks.	100 lbs.	3.40

* Nominal.

RATES to be paid in advance. Standard setting 5c a word, minimum charge $2.00 each; include 8 words for box address. Exceptions see ⟶ Display, $7.50 per column inch. No discounts or allowances.

SEND advertisements with remittance to INDUSTRIAL AND ENGINEERING CHEMISTRY, 332 West 42nd St., New York, N. Y., to reach there not later than 10:00 A.M. on the 10th and 25th, closing dates for NEWS EDITIONS of the 25th and 10th, respectively. Insertions made in order of receipt provided necessary remittances are complete.

Employers are requested to mention in their announcements the section of the country in which the open position is located to ensure replies only from those who are geographically available.

In printing these advertisements the SOCIETY assumes no obligations as to qualifications of prospective employees or responsibility of employers.

Unemployed members of the AMERICAN CHEMICAL SOCIETY seeking employment for themselves are allowed in one calendar year 3 free announcements, one per issue, set in standard style and limited to 50 words each, including 8-word box address. Excess words 5c each. Additional standard announcements 50% of regular rate.

Employed members of the AMERICAN CHEMICAL SOCIETY seeking new positions are permitted 3 standard announcements during the calendar year at 50% of the regular rate—include 8 words for box address.

Employers seeking chemists and chemical engineers are permitted 3 standard announcements, not to exceed 50 words each including box address and not more than one per issue, during the calendar year without charge, provided they agree in writing to acknowledge all replies (excess words 5c each), otherwise full rate applies.

The AMERICAN CHEMICAL SOCIETY is vitally interested in the welfare of its members and in seeing that the chemical industry is manned with competent chemists and chemical engineers. These pages are part of our service in that connection. In addition most of the larger sections of the AMERICAN CHEMICAL SOCIETY and several of the smaller ones have active employment committees. Local section secretaries in your area will inform you as to any employment aids that may be available locally.

An Employment Clearinghouse is operated at each national meeting of the SOCIETY for the purpose of bringing together representatives of industry looking for chemists and members and student affiliates in attendance wishing to make such contacts. For further details, consult the preliminary and final programs as printed in the NEWS EDITION prior to each meeting.

In the New York area, special employment facilities are offered by the Employment Bureau of the Chemists' Club, 52 East 41st St., New York, N. Y., and by the Chemist Advisory Council, Inc., 60 East 42nd St., New York, N. Y. In the Chicago area, the Chicago Section maintains an employment service at 413 Stevens Hotel, Chicago, Ill.

Those replying to announcements should be careful to send copies and not original documents. Advertising circulars will not be forwarded and to that end all letters will be opened at the forwarding office.

SITUATIONS OPEN

Those announcements in which the letter "I" is part of the address key have paid in full and are not committed to acknowledge replies. The Society regards acknowledgment by employers of all applications as an act of common courtesy but can assume no responsibility for their failure to do so.

EXECUTIVES, CHEMICAL ENGINEERS AND CHEMISTS with exceptional backgrounds of experience should use our confidential and individual method of contacting responsible employers. No limit to territory. We negotiate all overtures. Established 1915. The National Business Bourse, 20 W. Jackson Blvd., Chicago, Ill.

RUBBER CHEMIST wanted by large Eastern concern engaged in manufacture of synthetic rubber. Must be graduate chemist or chemical engineer with three to five years of experience in rubber industry both in non-routine laboratory work, and factory compounding and processing. Opening offers opportunity in research, manufacture and sales. Recent snapshot, personal information and salary requirements requested. Our own personnel has been advised of the appearance of this advertisement. Applications will be treated in strictest confidence.
Box 64-NP-12, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL LABORATORY supply house wants man having sales and purchasing experience in this line.
Box 54-TP-12, Ind. & Eng. Chem., Easton, Pa.

GRADUATE ASSISTANT wanted beginning with the second semester to do part time laboratory teaching and to work toward the Master's Degree. Salary $60 per month. Exemption from fees and tuition except $25 per semester. For application blanks, write to H. D. Newton, Head, Department of Chemistry, University of Connecticut, Storrs, Connecticut.

ORGANIC RESEARCH chemist, Ph.D., under 30, with wide experience in synthetic organic chemistry for development of research department in large mid-west industry. Submit full details of education, experience and complete personal data. Include salary expected and recent photo.
Box 14-N-1, Ind. & Eng. Chem., Easton, Pa.

WOMAN CHEMIST for research laboratory of mid-western detergents manufacturer. Training, intelligence and initiative to carry on independent work required yet cooperation with others necessary. Sound technical training essential and industrial experience desirable. Include photograph and give fully reply first letter.
Box 15-N-1, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER for research and development on unit processes in grain alcohol manufacture and in by-product recovery. Require man with doctor or master degree and about one year additional experience. State qualifications and salary expected in letter and enclose small photograph. Midwest location.
Box 18-NP-1, Ind. & Eng. Chem., Easton, Pa.

ANALYTICAL CHEMIST for small industrial research laboratory. Prefer man with doctor's degree and about one year additional experience. Mostly organic materials requiring some microanalyses. Location Midwest. Send outline of record, salary expected and photograph.
Box 19-NP-1, Ind. & Eng. Chem., Easton, Pa.

WANTED BY large Eastern concern for immediate employment: Chemists or chemical engineers for research and development work in petroleum and polymer chemistry. Our own employees have been advised of this advertisement. Replies will be treated in strictest confidence.
Box 22-N-1, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST wanted. Location, New Jersey. Relatively recent graduate. In first letter of application, state age, experience, if any, education, religion, citizenship, marital status.
Box 23-N-1, Ind. & Eng. Chem., Easton, Pa.

POSITION TEACHING "General Chemistry," "Teaching of Chemistry," "History of Chemistry," in large, fully accredited, mid-western university. Success will be measured by teaching results, activity in Division of Chemical Education, effectiveness in contacting and leading secondary school science groups. Send full particulars in first letter.
Box 24-N-1, Ind. & Eng. Chem., Easton, Pa.

EXPERIENCED RUBBER Chemist and technologist for an Eastern Company. Must have full and varied background in synthetic rubbers as Neoprene, Hycar, Thiokol, etc., both with dry rubber compounding and cement manufacture. State age, experience, etc.
Box 38-NP-1, Ind. & Eng Chem., Easton, Pa.

INORGANIC ANALYTICAL Chemist with recent B.S. or M.S., north Philadelphia suburb. Opportunity to become chief chemist. Must be familiar with modern technique and capable of devising new time-saving methods. Knowledge of microscopy and optical analysis desirable but not essential. Some research work. Reply giving full details on education experience, personal data, availability, references, salary expected. Enclose full length recent photo. Gentile only.
Box 44-NP-1, Ind. & Eng. Chem., Easton, Pa.

BIOCHEMIST Bachelor or Master, must have outstanding scholastic record and good foundation in physical and organic chemistry. Applicants should give educational history, experience, age and other personal data, and recent photo. Excellent opportunity for qualified person in research laboratory of prominent food organization.
Box 47-NP-1, Ind. & Eng. Chem., Easton, Pa.

SITUATIONS WANTED
(A.C.S. MEMBERS)

CHEMIST, BIOCHEMIST, bacteriologist. A.B., 16 years' experience in foods, biological and bacteriological products, plant management including production, maintenance, personnel, and accounting. Successful research and sales records. Patent experience. Age 39, married, Protestant. Continental U. S. preferred.
Box 66-T-10, Ind. & Eng. Chem., Easton, Pa.

FOOD CHEMIST with over twenty years wide experience in the food industry, in direction, research, process development, quality control, and factory problems. Desires a responsible position.
Box 48-T-11, Ind. & Eng. Chem., Easton, Pa.

CHEMIST B.S. 1940. One year towards M.A., A.C.S. approved universities. Single, 23, draft deferred. Analytical, physical, crystal structure, and some organic research. Read French, German. Desire research, development, or position leading thereto. Far west preferred, but will consider anywhere. Available immediately.
Box 76-T-11, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, PHARMACIST, age 43, single, Marquette University, 20 years' Drug and Chemical experience combined with selling. Sales manager for a liquor wholesaler. Desires analytical or plant operation position in an ordnance, pharmaceutical or distillery plant. Middle west desired but not essential. Will consider plant representative sales.
Box 30-N-12, Ind. & Eng. Chem., Easton, Pa.

SALES DEVELOPMENT Engineer available for South America. Chemical engineer, graduate work business administration. Experience in sugar and oil refining. At present employed as sales development engineer for large chemical company. Married, no children, age 27. Will require several months notice.
Box 41-N-12, Ind. & Eng. Chem., Easton, Pa.

BIOCHEMIST Ph.D. 1924 with 17 years' experience in development and production of glandular and vitamin products. Special interest in development of new products and clinical uses. Desires position in either laboratory and plant development or promotion and sales. Available immediately.
Box 13-T-12, Ind. & Eng. Chem., Easton, Pa.

PRODUCTION CHEMIST. Graduate chemical engineer with 20 years' diversified experience in heavy chemicals, acids, purified cellulose fibre, nitrocellulose, viscose-cellulose film, paper coatings, lacquer formulation. Positions held: chief chemist, pilot plant design and development engineer, production department chief and plant superintendent. Primary interest in production supervision.
Box 30-T-12, Ind. & Eng. Chem., Easton, Pa.

ELECTROCHEMIST-CHEMICAL Engineer. Ph.D. thesis accepted and course work completed at large Eastern university. Three years experience as assistant to prominent consultant; now employed. Successful prosecution of patents; development of metal recovery processes. Several publications; honor societies. Age 28, married. College teaching, industrial research, or specific problems on a consulting basis.
Box 10-N-1, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER, B.S. Fifteen years experience in plant research, pilot plant development, and plant control. Experience includes design, construction, installation, development, operation and maintenance of a number of processes and a diversified list of equipment for organic and inorganic chemistry. Primary interest is in development.
Box 11-N-1, Ind. & Eng. Chem , Easton, Pa.

ANALYTICAL, INORGANIC chemist available for teaching or industrial position. Ph.D Experience covers college teaching, supervision of analytical methods, wide variety of analyses, inorganic projects. American, adaptable, publications, honor societies. Location immaterial.
Box 16-N-1, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, Ph.D. Woman. Six years research and analytical experience. Training in biochemistry, bacteriology and medical fields. Five languages fluently. Desires research analytical or literature position. Preferably in East.
Box 20-N-1, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST finishing M.S. in synthetic and theoretical organic chemistry. B.S. 1939. Phi Beta Kappa. Age 24, single. Desires position in research or production. Available immediately. Location immaterial, although vicinities of Philadelphia or Cleveland are preferable.
Box 26-N-1, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, Ph.D., 1933, post graduate work organic synthesis in University in Switzerland, industrial experience in research and development of synthetic waxes, resins, coating compositions, emulsions, surface active agents. Literature research in 4 languages, age 33, married, 2½ years' in U.S.A. and employed (first papers) desires change for greater opportunity.
Box 27-N-1, Ind. & Eng. Chem., Easton, Pa.

(Continued on page 74)

Address communications to the box number indicated and Mail to Easton, Penna.

The American Chemical Society has no information concerning the position advertised—or in regard to those seeking employment.

(Situations Wanted Continued)

FOOD CHEMIST, Ph.D. 1941, large eastern university, desires industrial position. Special experience in chemical vitamin analysis, with thorough training in physical chemistry. Age 24, single, 3A in draft, available Feb. 1.
Box 30 N-1, Ind. & Eng. Chem., Easton, Pa.

PROFESSORSHIP Ph.D., Phi Beta Kappa, listed in Who's Who, Protestant. Experienced in teaching General, Organic, and Industrial Chemistry, also as industrial research laboratory director. Now employed, but interested in return to teaching because of opportunity for essential constructive work.
Box 31-N-1, Ind. & Eng. Chem., Easton, Pa.

EXPERIENCED PHYSICAL Chemist, excellent scholastic standing, available for research position. Eleven years' successful research in gas reactions, hydrocarbon chemistry, catalysis. Many publications, patents. Author of books recognized as standard works in their respective fields. Married, 35. First papers obtained (British subject).
Box 32-N-1, Ind. & Eng Chem., Easton, Pa.

PHYSICAL and INORGANIC Chemist, Ph.D. Cornell, with teaching experience in general chemistry, research work in insecticides and fertilizers, publications and patents, and experience translating and abstracting, desires teaching or research position.
Box 35-N-1, Ind. & Eng Chem., Easton, Pa.

CHEMIST, ORGANIC, Ph.D. in 1942 from Eastern University. Available immediately. Research in enzyme chemistry and analytical organic. Publications. Broad background in major field including synthetic organic. Minor in physical and biochemistry. 4 years' experience in teaching organic and inorganic. Eastern location preferred but not essential.
Box 36-N-1, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST Chemical Engineer: A.B., M.A., 3½ years' towards Ph.D. (evenings). 5 years' experience industrial research, principally in organic chemical lines, cosmetics, and pharmaceuticals. Wants position in production or research with good chance for advancement. Draft deferred. Available immediately.
Box 37-N-1, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL MICROSCOPIST. Organic chemist. Minor in physical Chem., M.Sc. from an eastern university plus year of recent graduate study. Decade of college teaching. Publications. Biochemical background. Available February.
Box 41-N-1, Ind. & Eng. Chem., Easton, Pa.

INORGANIC and ANALYTICAL chemist, B.A., M.S., 1941 USC, age 25, single American, draft exempt. Languages. References. Graduate research on beryllium. Expert in mineralogy, assaying rare, precious and common elements. Rocks, ores and metallurgical analysis. Desires position with consultant or to do research and development testing. Immediately available. Los Angeles vicinity. Ed Calderon, 206½ E. 24 St., Los Angeles, Calif.

SITUATIONS WANTED
(NONMEMBERS)

GRADUATE WOMAN Chemist, age 32, excellent knowledge German, French, some Spanish; also medical and engineering phraseology. Experienced research and executive office routine. Writing ability. Wants position combining research and office, or research and laboratory, or reporting for trade paper. No straight abstracting or stenography wanted.
Box 40-N-12, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL PATENT Attorney, New York City is interested in part time connection.
Box 12-T-12, Ind. & Eng. Chem., Easton, Pa.

PATENT ATTORNEY'S assistant. Lawyer, 13 years broad general experience; intensive appellate experience; working toward M.P.L. and B.S. in chemical engineering; excellent potentialities for patent work. Desires connection specialising chemical patents, Chicago area.
Box 21-N-1, Ind. & Eng Chem., Easton, Pa.

CHEMIST, B.S., 1940, now employed in pharmacy and doing own research on quinine synthesis, desires opportunity in chemical laboratory. Knows Spanish and German. Age 23. Draft deferred.
Box 33-N-1, Ind. & Eng. Chem., Easton, Pa.

ELECTROCHEMIST: Chemical engineer, Columbia; fourteen years' industrial experience; general consulting laboratory, electrodeposition, metal finishing, and allied fields; installation, process development, research. Several outstanding developments. Available part time, temporary and consulting. Full time position considered.
Box 39-N-1, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER, Ph.D. 1933 desires responsible research or development position with progressive organization. 4 years' academic research and 8 years' industrial experience in new process development (wetting agents, detergents, higher alcohols) and oil refining technology. Many patents and publications. Age 35, married.
Box 42-N-1, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, B.S in Chem. Eng., ten years' experience in compressed gas industry. Experienced gas analyst, likewise organic research. Married, 39.
Box 43-N-1, Ind. & Eng. Chem., Easton, Pa.

Industrial Literature

CONTINUED FROM PAGE 70

Also included are instructions for cold working, hot working, annealing, design, fabrication, arc welding, and surface cleaning. *Bulletin T-4 IE.* INTERNATIONAL NICKEL CO., INC., 67 Wall St., New York, N. Y.

Hand Pumps. The hand pumps described in this 4-page bulletin are designed primarily for operating hydraulic jacks and other small hydraulic tools as well as for testing purposes. Pressure capacities shown range from 1,500 to 30,000 pounds per square inch. Ten different types of pumps are illustrated, including single and double plunger types, the latter for use where high speed of initial movement is required. Construction features of each are described. *Bulletin 240-A IE.* WATSON-STILLMAN CO., Roselle, N. J.

Heat Transfer Equipment. In this 4-page bulletin the manufacturers have given brief but informative data on a new line of heaters, coolers, and condensers. Flow diagrams are widely used to illustrate operating characteristics. Six different types of equipment are described. *Heaters, Coolers, Condensers IE.* DOWNINGTOWN IRON WORKS, HEAT TRANSFER DIVISION, Downingtown, Penna.

Industrial Pumps. This bulletin is planned as an aid to the proper adaptation of these vertical pumps to widely varying operating conditions. The manufacturers point out that these pumps have earned a reputation in such operations as booster, transfer, condenser, circulating, agitator, vat, sump, vacuum lift, vaco-process sinking, caisson dewatering, dredge transfer, air conditioning, filter wash water, sewage treatment, and fire protection. The bulletin emphasizes simplicity of construction, ease of installation, non-overloading characteristics, and variable capacity. *Bulletin 29-A107 IE.* POMONA PUMP CO., 120 Broadway, New York, N. Y.

Liners—for Ball Mills. This 8-page engineering bulletin is devoted entirely to a discussion of the various types of liners required for different industrial work. The bulletin discusses design, gives interesting comparisons on tonnage handling, and deals with a variety of installations. *Bulletin 1141L IE.* AMERICAN MANGANESE STEEL DIVISION, Chicago Heights, Ill.

Manometers. An 8-page catalog includes not only manometers but also draft gages, flow-meters, mercury pressure and tank gages. Equipment is discussed in relation to its service in measuring pressures, vacuums, and flows of liquids and gases. *Bulletin C-10 IE.* MERIAM CO., 1955 West 112th St., Cleveland, Ohio.

Mills, Mixers, and Sifters. A 4-page bulletin describes this equipment in relation to its service for the drug and cosmetic industries. The line includes large pebble mills for production work as well as smaller jar mills useful for operations on small quantities of material. Size and capacity tables are supplied for both sifters and mixers. *Bulletin 39 IE.* ABBE ENGINEERING CO., 50 Church St., New York, N. Y.

Motors. This new bulletin gives a complete technical discussion, devoted entirely to a working description of construction and operation characteristics, of a well-known line of single-phase, direct-current, and small polyphase motors. The illustrations include both drawings and cut-section photographs showing the details of design in relation to operating characteristics. *Bulletin M U-183 IE.* WAGNER ELECTRIC CORP., 6464 Plymouth Ave., St. Louis, Mo.

Orthosil. This little booklet is devoted to the practical use of this cleaning agent. Use recommendations bear directly on the cleaning of metal surfaces before finishing operations are undertaken. *Orthosil IE.* PENNSYLVANIA SALT MFG. CO., 1000 Widener Bldg., Philadelphia, Penna

Pebble and Ball Mills. A 6-page booklet will make interesting reading for any engineer who is working with grinding or processing problems. After an initial discussion of the considerations determining the choice of equipment, the authors proceed with a well-illustrated discussion of operating characteristics and construction features. Capacity tables and a specification table will be of material assistance in selecting the right equipment. *Bulletin 55 IE.* ABBE ENGINEERING CO., 50 Church St., New York, N. Y.

Platinum Catalysts. A pocket-size booklet discusses the field of usefulness of platinum and palladium catalyst work. The booklet describes 32 types of catalyst combinations with recommendations as to the use of several. *Platinum Metal Catalysts IE.* BAKER & CO., INC., 113 Astor St., Newark, N. J.

Plywood. An interesting 8-page folder contains a brief history of the plywood industry, describes present-day methods of manufacture, and illustrates the widespread uses of this new structural material, including a discussion of its application in aircraft. *Folder IE.* DUREZ PLASTICS & CHEMICALS, INC., North Tonawanda, N.Y.

Pressure Filters. This type of filter is designed for production problems requiring filtering, clarifying, or polishing of chemicals, dyes, fruit juices, wine, beer, sirups, inks, and other fluids. Details of construction are covered by both photographs and line drawings. These filters are available in three sizes with areas of 25, 50, and 100 square feet. *Bulletin 123.* OLIVER UNITED FILTERS INC., 33 West 42nd St., New York, N. Y.

Protection Coatings. This little bulletin describes a line of coatings designed to

WANTED SCRAP

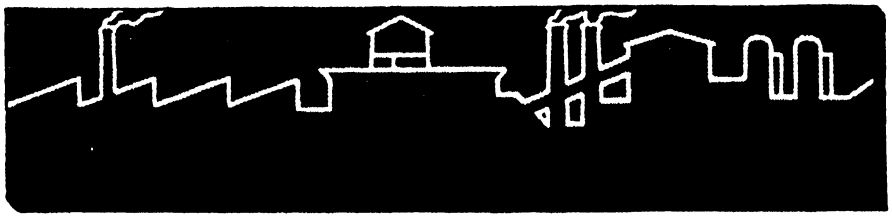
Nickel, Monel and Alloys, Residues, Oxides, Precipitates, Sludges, Containing Zinc, Tin, Nickel, Copper, Cadmium, Tungsten, Molybdenum, Vanadium.

Metallurgical Products Co.
Reclaimers — Processors — Established 1909
35th & Moore Sts. Philadelphia, Pa.

WANTED: "Acta Physicochimica," Volume 5, 1936. Please state price expected. Margaret Carlson, Librarian, American Cyanamid Company, Stamford, Connecticut

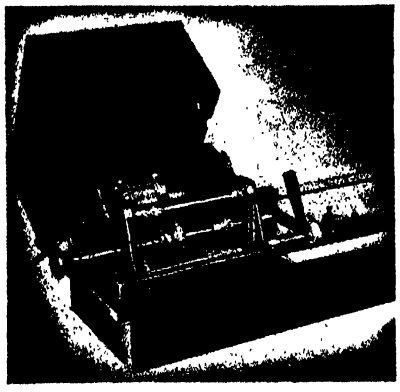
WE ARE interested in buying the following journals: "Chemisches Centralblatt," April 1914 to present with collective indexes; "Berichte der Deutschen Chemischen Gesellschaft," 1912 to present with collective indexes; Leibigs' "Annalen der Chemie," volume 407 to present, including indexes from volumes 308 to present; "Journal of the Chemical Society of London," 1900 to present with collective indexes; "Transactions of the Faraday Society," 1920 to present. Please give prices and state whether periodicals are bound or unbound, and indicate their condition.
Box 49-T-12, Ind. & Eng. Chem., Easton, Pa.

FOR SALE: Traylor lead blast furnace, 36 × 72". Condition good.
Box 25-N-1, Ind. & Eng. Chem , Easton, Pa.



FOR SALE: Chemical Abstracts, Volumes 1-27 (1907-33), with First and Second Decennial Indexes. Unbound and in excellent condition.
Box 28-N-1, Ind. & Eng. Chem., Easton, Pa.

FOR SALE: London Edinburgh and Dublin Philosophical Magazine and Journal of Science years 1798 to 1925 bound. Chemical Abstracts vols. 3 to 1939 with first and second decennial indexes. Wish to purchase: Intern. Critical tables, also complete Chemical Library.
Box 29-N-1, Ind. & Eng. Chem., Easton, Pa.

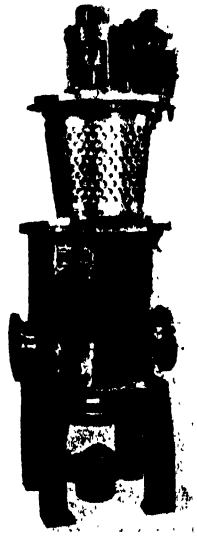


FOR SALE: "American Chemical Journal" (by Ira Remsen), complete set; "Journal, American Chemical Society": Vols. 16-60, complete, bound; "Chemical Abstracts"; complete bound set, with 3 Decennial Indexes, bound. A. Calvert, 221 Seaman Ave., New York, N. Y.

FOR SALE: Need Equipment? In a hurry we have available for immediate delivery at very low prices standard laboratory equipment. A few are listed, many others are available Write us your needs at all times. Hydraulic laboratory presses, International Centrifuges, microscopes, Zeiss and B & L Abbe Refractometers, Freas Ovens, Incubators, small and large single wall ovens, Analytical balances, Spectrophotometers, Hilger Spectrometer, Gaertner Photometer, B & L Dubosq, Colorimeters, Autoclaves, Stills Furnaces, Vacuum ovens, De Laval Separators, Colloid Mills, Saccharimeter, Hoskins Pyrometer, Testing Machines, etc. More than ever we are at your service for Laboratory Apparatus. Whether you wish to buy or sell, write or wire us for complete information. The Laboratory Exchange, 24 E. 21st Street, N. Y. C.

FOR SALE: 1000 lbs. Copper Fluosilicate, 5 tons Nickel Sulfate single 18%, 100 lbs. Calcium Levulinate, 100 lbs. Levulinic Acid, 20 grams d-Ribose, 25 grams Galacturonic Acid, 10 kilos Cystine, 1000 grams Germanium Dioxide, also Caesium, Rubidium, Indium, Gallium.
Box 45-N-1, Ind. & Eng. Chem., Easton, Pa.

Ductility Machine

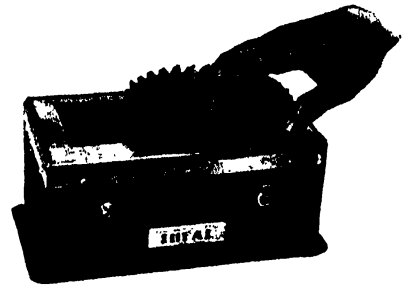


PRESENTING several new features, the new ductility machine announced by the Precision Scientific Co., 1750 North Springfield Ave., Chicago, Ill., complies with Designation D-113 of the American Society for Testing Materials, for testing the ductility of bituminous materials at speeds of 0.25, 1, or 5 cm. per minute. Having a depth of 5 inches, ample room is allowed for insertion of cooling coils or ice when conducting tests at reduced temperatures.

The selective gear-drive mechanism, fully enclosed in a metal housing, is of the automotive type, with all gears of bronze, on steel shafts. Bearings are of the oilless type, requiring no lubrication. Speed selection is virtually instantaneous, by means of a gear shift lever protruding from the gear-drive housing.

Ruggedness, coupled with accuracy, is achieved by utilizing a bronze lead screw, with Acme square threads free from sharp peaks, to avoid screw thread delicacy. A single lead screw occupies little space in the trough, and is above the water level so that agitation of the water does not occur. After the carriage reaches the 150 cm. limit, it automatically disengages the lead screw, and comes to rest.

Readings can be taken up to 150 cm. The scale is divided in centimeters and millimeters, and the indicating pointer is adjustable, so that it can be set to the exact zero position at the starting point.

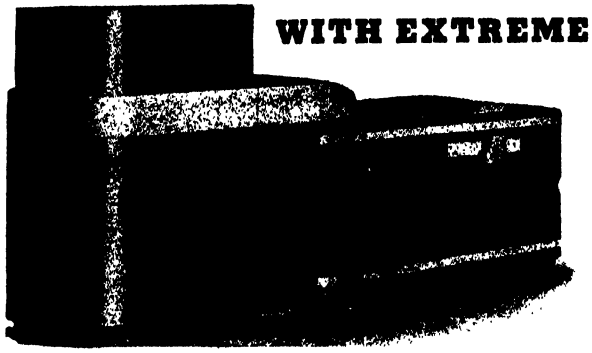


New Multipore Rubber Screening Medium

H. A. BRASSERT & Co., 60 East 42nd St., N. Y., announce that a new screening medium of Multipore rubber has been added to the media available for Brassert automatic strainers and complements those already available in glazed perforated porcelain and reinforced stainless steel screening.

The Brassert strainer consists essentially of a rotating drum fixed to a vertical shaft and centered within a cast-iron housing. The entire vertical surface of the drum is perforated, and into each hole a circular filtering disk is fitted. Liquid enters through the inlet, rises around the outside of the revolving drum, and passes through the screening media into the central section. It is then discharged from the bottom. As the drum revolves, the straining disks pass in front of a washout orifice, in the form of a vertical slot, which backwashes one row of disks at a time using strained water as the wash liquid and discharging into a separate basin. Units are available in capacities ranging from 110 to 24,100 gallons per minute using 80-mesh screen and a pressure drop of 1.5 pounds. In the small size there are 22 screening disks while the large requires 3,600.

New Demagnetizer

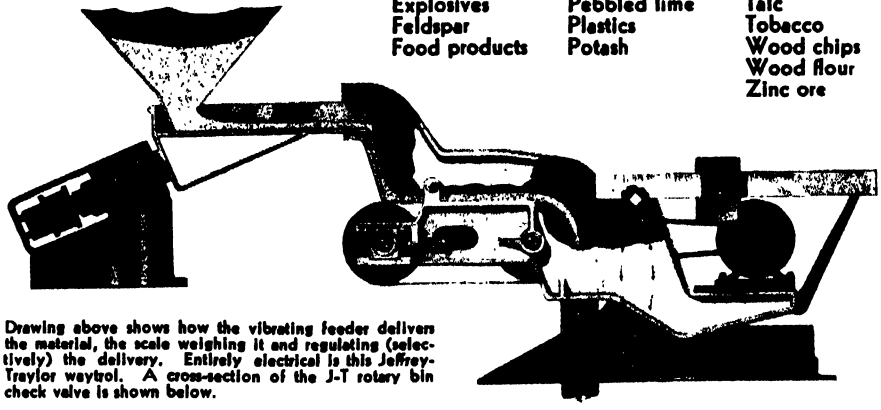


A NEW, powerful, portable demagnetizer is announced by the Ideal Commutator Dresser Co., 1347 Park Ave., Sycamore, Ill.

It quickly demagnetizes tools, drills, punches, dies, and work held in magnetic chucks. Abrasive particles such as metallic dust, flakes, fine chips, etc., are easily removed after a single pass across the magnetic poles.

Large parts may be demagnetized in a similar manner, except that the demagnetizer is moved over the heavy, bulky work.

CONTINUOUS FEEDING WITH EXTREME GRAVIMETRIC ACCURACY



Jeffrey-Traylor electric vibrating weytrols (Patented) give a much different conception to continuous feeding when extreme gravimetric accuracy is required. They will deliver a continuous uniform flow of a given weight per hour — eliminate the effect of bin load, material size and density variations, and other outside factors contributing to inaccurate feeding. May be remotely controlled, interlocked with processing equipment. Investigate.

Type 100 Jeffrey-Traylor weytrol complete with dust-tight housing.

PARTIAL LIST of materials being fed with J-T weytrols:

Activated carbon
Alum
Ammonium sulphate
Bauxite
Cement clinker
Chemicals
Clay
Coal
Explosives
Feldspar
Food products
Fullers earth
Gypsum
Cullet
Iron ore
Limestone
Pebbled lime
Plastics
Potash
Salt cake
Sand
Shale
Soda ash
Starch
Talc
Tobacco
Wood chips
Wood flour
Zinc ore

Drawing above shows how the vibrating feeder delivers the material, the scale weighing it and regulating (selectively) the delivery. Entirely electrical is this Jeffrey-Traylor weytrol. A cross-section of the J-T rotary bin check valve is shown below.

Jeffrey-Traylor electric vibrating equipment includes economical units for feeding, weighing, conveying, cooling, drying, packing and screening . . the basis for all is balanced high frequency vibration under absolute control. They provide a new conception to feed control—rate can be changed when unit is running—no mechanical adjustments required. Let us send you literature.

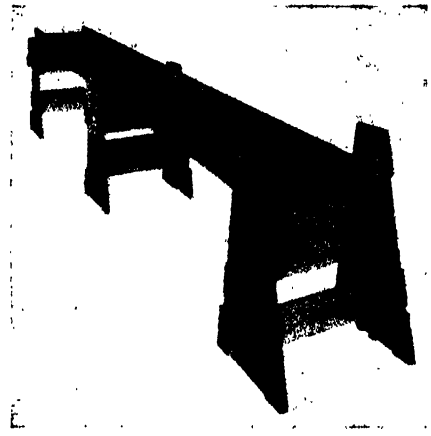
protect equipment against water, acids, alkalies, and corrosive gases. After discussing the composition of these materials, brief recommendations are made as to the choice of particular numbers for the problem in hand. *Prufcoat Protective Coatings IE.* PRUFCOAT SALES CO., 202 104th Ave., Hollis, Long Island, N. Y.

Solvamin, a natural source of riboflavin is the subject of a 13-page bulletin which describes the characteristics of Solvamin and deals briefly with importance of riboflavin in the human diet. The question and answer section will be of particular interest to food and pharmaceutical manufacturers. *Solvamin, Rich in Riboflavin, Booklet IE.* COMMERCIAL SOLVENTS CORP., 17 East 42nd St., New York N. Y.



Squeegee Type Pumps. These pumps, operating on a unique principle, are available in single- and double-stage. Single-stage pumps deliver 0.5 gallon to 50 gallons per minute and discharge pressures of 50 pounds. The essential operating element consists of flexible rubber tube units squeezed and released by the action of a circular rotator or rocker mechanism. Installations in service show that the pump can handle solutions containing a lot of solid as well as viscous or stringy solutions. *Bulletin 1041 IE.* DOWNINGTOWN MFG. CO., HUBER PUMP DIV., Downingtown, Penna.

Stainless Steel Electrodes. This 11-page, compact technical bulletin contains tables showing current values and deposition data as well as information on heat treatment and applications of stainless electrodes. A feature is the table of stainless weld metal data which gives a variety of applications and provides chemical analysis, physical properties, and heat treatment for each type of job. *Arcos Technical Bulletin 5 IE.* ARCOS CORP., 401 North Broad St., Philadelphia, Penna.

Stainless Steel Processing Equipment. Rather than attempt to sell equipment the authors of this bulletin have sought to guide the prospective purchaser in making an intelligent selection. Line drawings are used in interesting fashion to illustrate significant variations in favorable technic. *"What to Look For" IE.* S. BLICKMAN, INC., Weehawken, N. J.

Thickeners. A 4-page engineering booklet describes these thickeners designed for thickening, washing, and leaching materials that do not readily settle from a suspending fluid. Because of their compact design, they can be used on rapidly settling materials where the cost of special materials of construction would be too high if ordinary thickeners were used. Their greatest field of usefulness is on materials that settle slowly, owing either to a low differential in density between these materials and the suspending liquid or to their finely divided state. Applications include thickening, continuous decantation and washing, and counter-current leaching. *Bulletin 114 IE.* T. SHRIVER & Co., 810 Hamilton St., Harrison, N. J.

Wood Roller Conveyor

A WOOD roller conveyor especially designed for handling explosives in ammunition and armament plants is announced by the Standard Conveyor Co., North St. Paul, Minn. Rollers and frames are made of maple and brass. Bearings are either ball bearing or oilless bronze. Shafts and shaft holders are made of brass. Supports are made of wood and are adjustable for various heights. In fact, the construction throughout is wood and brass to prevent any sparks from friction.

Industrial Research in Foreign Countries during 1941

WILLIAM A. HAMOR

Mellon Institute, Pittsburgh, Penna.

War wears mechanical garb, and every opportunity is being sought to apply mechanisms to multiply the strength and speed of man and to conserve his energies for direction and control. Physical efficiency and intense research and technologic development characterize the present conflict. There has also been much investigational activity the world over because, whatever the outcome of the war, there will be heavy debt and it is generally realized that the only certain road to recovery is to increase industrial power.

That less is heard about chemistry in Great Britain and Germany than during the first world strife—less regarding chemical industry, shortage of this or that chemical, need for chemists and chemical engineers—is principally attributable to the prevision of the chemical profession and the chemical manufacturing field and to their prewar organization in those countries. These nations are equipped for offensive and defensive chemical combat.

Canada

Of 19 projects in the $105,000,000 program administered by Allied War Supplies Corporation, 14 are in production; not less than 12 types of chemicals and 8 explosives will be included in the final output. The staff of the National Research Council's laboratories at Ottawa has been almost doubled since the war began. The funds at the disposal of the council for 1941 have been some fivefold greater than for the last prewar year. In addition, other projects will involve about twice or three times as much again and a trust fund set up by the industries of well over $1,000,000 is available if needed. Research Enterprises, Ltd., is a wholly owned government corporation established by the Ministry of Supply to produce for the armed forces and for the industries devices developed by the council. Optical glass and instruments and radio gear are being manufactured; a new de-icing fluid for aircraft propellers has also been evolved by the council. Aeronautical laboratories have been constructed outside Ottawa. About 1,000 laboratories are being maintained by industrial establishments; close to 225 laboratories are in operation in universities. A Wartime Bureau of Technical Personnel has been set up in the Department of Labor to recruit competent persons for scientific work in the war industries.

Minerals and Metals

War minerals are being sought widely, and numerous discoveries have been made. Efforts toward the commercial production of graphite in Labrador are progressing. In Newfoundland exploration for fluorspar has been going on for over three years; the production of this mineral is about 15,000 tons annually. A large deposit of barite has been found near Windsor, Nova Scotia. Deposits of magnesite, tungsten, cobalt, antimony, and chromium were reported in British Columbia, where prospecting for manganese and bauxite was also conducted. Chromite deposits on the Fox Island River in Newfoundland were examined. The production of radium ore has been suspended because there is a two years' stock. The National Research Council has investigated extraction of radioactive substances other than radium from Great Bear Lake pitchblende, which contains 53 different elements. Ionium should be applicable in the preparation of luminous paints, but, like polonium, it is lost in the present Port Hope refinery process. The gypsum industry was further developed. A new type of gypsum wallboard is being manufactured in New Brunswick. The annual consumption of refractories is about $3,000,000. Refractory products are being made from the dolomite of Kilmar and from the brucite of Wakefield, P. Q.; silica is losing ground to magnesite brick in metal-smelter roof service; special types of basic and neutral refractories are under investigation by the National Research Council. Despite the reported development of a type of ceramic aviation plug to replace satisfactorily mica plugs, the latter still continue in use. A group of cast-iron enamel ground coats containing 80 per cent nepheline syenite and 20 per cent flint was shown to approximate an all-feldspar coat. Steel production is expected to reach an annual rate of 2,500,000 tons early in 1942. Research on the production of pure uranium metal and the ferroalloy has been continued. Steel parts of airplanes are cadmium-plated before painting. The Arvida plant of the Aluminum Co. of Canada has been producing about 1,000,000 pounds of aluminum daily; the annual output was expected to increase to about 500,000,000 pounds by the end of 1941 and this production is to be doubled by 1943, when one sixth of all the electrical energy generated in the Dominion will be used in producing aluminum. By the close of 1942 sufficient aluminum will be made for 80,000 aircraft annually. Silver hardens aluminum; lead reduces the hardness of aluminum-silver alloys. The war demand for nickel, copper, and zinc is keeping the pertinent mining, smelting, and refining industries working at peak levels. Consolidated Mining & Smelting announced the production of tin on a semicommercial basis at its Kimberley plant.

NATIONAL RESEARCH COUNCIL OF CANADA

An aircraft engine crankcase of cast aluminum alloy undergoes x-ray inspection for internal defects.

Chemicals

Basic investigations on photosensitized reactions have been continued by the National Research Council. Experiments have indicated that the system $3CaO.Al_2O_3.1.5H_2O$–$3CaO.Al_2O_3.6H_2O$ would serve as an efficient drying agent at temperatures below 100°. A combination of selective absorption and anion exchange offers the best possibilities of removing fluorine from domestic water supplies; promising results have been obtained with oxides of magnesium and aluminum and orthophosphates of calcium and aluminum. The production of military explosives in 1941 exceeded the total output from 1914 to 1918. Twenty-five plants are making heavy chemicals and the production of synthetic ammonia was started in the first of three new factories. Large quantities of magnesia are to be manufactured from brucite in a plant near Wakefield. Work has continued at the Ontario Research Foundation on methods for securing organic acids by fermentation and also on the preparation of pure lactic acid. The production of ethylene glycol by direct oxidation has been under study by the National Research Council. Polyvinyl chloride is to be manufactured. Polyvinyl acetates, of which four are in large-scale production, are known as Gelvas; they are hydrolyzed to give bodies containing free hydroxyl groups, termed Solvars; about 10 acetal resins are in commercial production, including Formvar, Alvar, and Butvar. Synthetic drying oils are being made from oleic acid and also from unsaturated triglycerides; a fast-drying heat-reactive oil is prepared from blends of linseed, pilchard, and soybean oils. Brown and white factices have been supplemented by Amberex (vegetable oil lightly sulfurized in presence of an accelerator) and Factex (an aqueous dispersion of partially vulcanized oil). Tysonite, a special brown factice, is useful for protecting insulated wire from the ozone generated in corona discharges.

Fuels, Wood Products, and Textiles

Natural gas is used to provide atmospheres for bright annealing and gas carburizing. The daily production of petroleum in the Turner Valley field is 22,000 barrels; a new oil field was tapped about 120 miles east of Calgary. The first aviation gasoline of octane value 80 to 87 came from the crude oil of Turner Valley. A plan is under consideration to produce motor fuels from a combination of ordinary gasoline and wheat-derived alcohol. The Alberta tar sands are to be worked for oil, of which they can yield at least 100 billion barrels. The high average of 150 gallons of gasoline has been produced by hydrogenation from a ton of Alberta coal. A plant to produce toluene and xylene was opened in Nova Scotia. TNT poisoning has been studied. Only 10 per cent of the timber resources have been tapped. Gas from wood has been foreseen for small plants and rural homes. Birch is being used in the manufacture of airplane veneers; plywood production in British Columbia has greatly expanded during the past two years. Newsprint, with a value of over $160,000,000 a year, is a leading export; about 75 per cent of the output is sold to the United States. Pyrite will be used instead of sulfur in the manufacture of pulp at Hull. Studies on lignin and related compounds were pursued actively at McGill. Extraction of lignin by the alcoholysis of wood appears to hold promise of future technical application, and the recent development of processes using only aqueous solutions of organic acids, such as sodium xylene sulfonate, indicate that lignin removal can be accomplished by much milder means than hitherto was regarded possible. At the Ontario Research Foundation 18 manufacturers of fabrics and 80 producers of garments are cooperating in a quality control program. The output of rayon fabrics showed an increase of about 30 per cent; more than $25,000,000 are invested in plant and equipment for the manufacture of rayon. Limited amounts of Canadian-made nylon hosiery (from imported yarn) were placed on the market early in 1941. The production of nylon is not expected before spring; the capacity of the plant to be erected at Kingston is placed at 575,000 pounds an-

(Ten days' advance notice required.) "Missing from files" cannot be accepted as the reason for honoring a claim. Charles L. Parsons, Business Manager, 1155 16th St., N. W., Washington, D. C., U. S. A.

nually. Canadian Industries will also install equipment in a plant at Brownsburg for the manufacture of nylon monofilament. Natural dyestuffs have been investigated from the standpoint of competition with synthetic dyes. By reacting acid-formaldehyde liquors with cotton and rayon materials under baking conditions these fabrics have been given modified dyeing properties while they have acquired considerably increased resistance to creasing and to shrinkage during washing and laundering.

Foods and Marine Products

Recommendations for research by the Canadian Chamber of Commerce embrace production of starch and gluten from wheat, sunflowerseed oil, utilization of wheatgerm oil and of refuse grain screenings, production of alfalfa meal, dehydration of fruits and vegetables, utilization of whey, and cultivation of certain drug plants. A mill was built in British Columbia to manufacture starch and glucose from surplus potatoes. The British Columbia Fruit Growers' Association is considering the establishment of a research laboratory to work on the utilization of apples. Waxing apples reduces shrinkage in storage but induces scald on McIntosh and Delicious varieties. In Vernon, B. C., experiments are in progress on the preparation of apple powder from surplus apple crops. At the Central Experimental Farm in Ottawa the production of distilled cider vinegar was studied. Mapelit is a new flavoring. Many cheese factories are using fine salt rather than cheese salt. Solutions of calcium propionate prevent the mold of cheese. Improvement in the flavor quality of Wiltshire bacon can be had by the adoption of better handling and curing practices. As regards this bacon, it may be noted that 23 papers on the subject have been published in the *Canadian Journal of Research*. Spoilage in pork or bacon fat is primarily caused by oxidation. Articles have appeared on canned smoked oysters, spiced surf smelts, canned smoked salmon, chum salmon products, halibut "cheeks" canned in jelly, canned smoked abalones, and canned smoked black cod. Canning of whale and seal meat is under development in Newfoundland. The strands of gill nets, treated with a benzene solution of Parlon, plasticized with dibutyl phthalate, and containing copper naphthenate, were found effectively preserved. Sodium benzoate combined with sodium chloride is best for fish fillet wrappers. Sodium or potassium nitrite in 0.1 per cent concentration is most effectual in fish preservation. The Fisheries Research Board issued a comprehensive bulletin on the chemistry and technology of marine animal oils. The Canadian annual production of cod liver oil of all grades is usually more than 150,000 gallons, although this quantity is only 25 to 35 per cent of the output in Newfoundland. A chemical preservative for fish livers, during the period between the catch and return to the home port, came into use in eastern waters. Five cod liver oil refineries are in operation; many of the extraction plants have improved equipment. The processing of swordfish and tuna livers from the Atlantic coast is being investigated.

A machine in the leather laboratory of the National Research Council of Canada for making fatigue tests on shoe upper leather. The movement simulates that of walking, and artificial perspiration is automatically injected at intervals.

Brazil

The government, considering the great mineral resources and the need for the development of heavy industries, set up the National Council of Mines and Metallurgy. Mineral exports for 1941 are roughly estimated to amount to $12,000,000. Production of sulfur from pyrite and of potassium salts and about 20 other chemicals is being studied. Plants are manufacturing ceramic materials, paper, textiles, leather, quebracho extract, essential oils, vegetable oils, cellulose from sugar bagasse, and polishes. Six factories produce practically all the cement consumed in the country. Backed by a $20,000,000 loan of the Export-Import Bank of Washington and the promise of technical aid from the United States, Brazil has started the construction of a steel industry. The production of aluminum from Brazilian ores is being investigated by the government.

Mineral Products

Most of the rock crystal comes from Goyaz, Minas Geraes, and Bahia; some of this mineral is especially valuable for the manufacture of optical instruments. Many rivers of the Amazon Valley yield a variety of shells suitable for buttons and novelty articles. Brazilian diamond sales have been increasing. The asphalt deposit in Anhembi has a reserve estimated at about 775,000 tons. The production of apatite at Ipanema is still small. An effort is being made to interest American importers in Brazilian rutile. Production of mica has increased notably in recent years. Most of the mica that Brazil exports is in block, but processing is being attempted. The output of beryl can be encouraged by extending purchases from the small producers and by developing concentration methods for ores. The production of manganese ore from the centers in Minas Geraes may be increased from 30,000 to 50,000 tons a month, if transportation facilities can be improved adequately. The Urucum manganese deposits are reported to be extensive. The chromite deposits in Bahia have not been developed. Two deposits of tungsten are known—the more important in Encruzilhada and the other in Mariana. The government of São Paulo has made an arrangement with the Instituto de Pesquizas Tecnologicas for the construction and technical supervision of a plant for the treatment of lead and silver ores. Cinnabar is being mined at Don Bosco. Columbite and tantalite are produced.

Chemicals

A plant produces caustic soda from sea water by the electrolytic process. A project to erect a caustic soda plant, to use the Solvay process, has been studied seriously. Textile soaps and oils are being made

locally from domestic supplies. Sodium silicate is being manufactured but is not used extensively in soap. Small plants producing oxalic and formic acids are at work in Rio de Janeiro. The growth of the coal-tar dye industry is evident by the increase in imports of intermediates used in making aniline derivatives. The production of medicinal preparations is being increased. Four hundred fifty-two registered laboratories are said to meet 90 per cent of the demand for pharmaceuticals and biologicals. Botropase, extracted from the venom of species of *Bothrops*, is an antihemorrhagic agent that has been under investigation.

Woods and Fibers

With the exception of Spanish cedar, useful woods of the Amazon Valley forests are often inaccessible and widely scattered. The principal commercial plantings of black acacia are in Rio Grande do Sul. There are at least 200,000,000 eucalyptus trees in the entire country. Gasogenio is a fuel for trucks obtained by the use of wood or coal; eucalyptus has been found to make the best wood for the generation of gas. A firm in São Paulo produces from Pau bark a material resembling corkboard. A National Pine Institute has been established. A cellulose plant is being erected in the southern Parana pine region; another company has been formed to make newsprint. A study of technical methods used in processing agricultural materials has been undertaken for Brazil by the U. S. Department of Agriculture. The cultivation of plants suitable for large-scale production of fibers to substitute for imported jute is under way; the Agricultural Development Service in the State of São Paulo has started a campaign to increase the production of various fiber plants, particularly sisal and ramie. Efforts to cultivate Indian jute are said to be successful in the Amazon Valley. Guacimo mixed with jute fiber is used to some extent in the manufacture of bags. Experimental plantings of sisal in São Paulo are yielding satisfactory results; the production of ramie fiber is still in the preliminary stage. The first fiber to be classified and standardized is caroa; five grades have been defined. Attempts are being made to increase the output of caroa, which has proved satisfactory for admixture with jute for the manufacture of twine and cordage; caroa has also been combined with jute and other fibers in yarn for suitings. Notices were sent out regarding the commercial production of fibers from pineapple plant in Parahiba.

JAMES SAWDERS

Sorting room in the Brazilian Government's experimental station for the growing of tobacco

JAMES SAWDERS

This Amazon Valley worker is bleeding a rubber tree.

Vegetable Oils and Rubber

Brazil has approximately 20 varieties of vegetable oils. Stimulated by the shortage of tung oil and by assistance of the Bank of Brazil, the oiticica oil industry has advanced. Bahia was expected to maintain the 1941 castor-bean production at about the same level as 1940 (40,000 to 45,000 tons). Leaf wax of the palm *Cocos coronata* resembles carnauba; the nut oil of the same plant (licuri oil) is similar to coconut oil. An effort is being exerted to utilize cashew nuts; the oil is being produced. A division on rubber was formed in the Instituto Naçional de Tecnologia. Rubber plantations in São Paulo are receiving favorable reports from the experimental stations. Farmers are said to be recognizing the possibilities of rubber plantings for providing shade for other plants, for the production of a drying oil from the seeds, and for utilizing the residue in animal feeds and fertilizers. Amazonas is the largest producer of rubber, having an output close to 7,000 tons; the second largest is Acre, yielding 5,000 tons, and Pará produces about the same quantity. It has been repeatedly affirmed that the hard-fine Pará rubber from the islands and the Territory of Acre has special qualities of resistance and elasticity attributed to the smoking process which makes use of the oily nuts of the urucuri palm, said to contain iodine. Ford's 2,500,000-acre rubber plantation near Belém began tapping trees on the original 22,000 acres developed over the past 12 years at a cost of $12,000,000. Firestone has large experimental rubber plantations in Colombia and Guatemala; Goodyear has done similar work in Colombia and Peru. Chicle Development of New York is reported to be purchasing Massaranduba latex.

Other Plant Products

The cultivation of wheat is becoming urgent in the agricultural development scheme. Since compulsory use of alcohol with gasoline was begun, alcohol production has been growing from year to year and the control organization for alcohol has recommended that the increased output of anhydrous ethyl alcohol be used as motor fuel. Reports show that 1,178,963 tons of sugar and 101,865,190 liters of alcohol have been produced during the current crop year. A new cassava mill has been built in São Pedro. Oil is to be produced from tomato seeds and the residual cake utilized in fertilizers and animal feeds. Equipment has been installed for making by-products of citrus fruits, such as oil and juice concentrates. A process has been evolved for vitamin A extraction from urucú. Caffein is being produced from maté. Brazil will be a most important source of natural caffein if Caffelite is manufactured on a large scale: from the planned annual consumption of 5,000,000 bags of coffee, there will be an output of 2,500,000 kg. of caffein. Other by-products of the Caffelite industry are to include coffee oil and furfural. Government authorities are trying to find local outlets for Caffelite, especially for use in wall and floor coverings, furniture parts, small electrical accessories, buttons, and novelties. Fifty thousand bags of coffee can be treated annually in the pilot plant in operation. Estimates are that Caffelite can be sold in the United States for 7 to 10 cents a pound. Pyrethrum cultivation is a comparatively recent development, mainly by small farmers. Five plants in Pará are engaged in milling the Amazonian woody vine timbo.

Other American Countries

Argentina. Production of beryllium oxide by a new process, utilizing native beryl, was initiated. In Argentine and Venezuelan petroleums, vanadium was found if the oil contained asphalt; the highest amount of vanadium occurred in the less soluble parts of the oil and residues. These facts are taken as confirmatory of the theory that vanadium is the principal factor in the formation of the asphalt. Government Oil Fields opened a research laboratory in the Province of Buenos Aires.

Investigation has shown that unrefined sugar caramelizes more rapidly than pure sucrose because of the presence of mineral compounds. Government officials are urging the chemical utilization of corn; only one concern is producing alcohol from this cereal. Two companies are starting to manufacture acetic acid by the oxidation of acetaldehyde from the catalytic dehydrogenation of fermentation ethyl alcohol. Steps have been taken to encourage olive cultivation and to make soybean products. A committee has been appointed to study possibilities of developing the paper industry; a company has completed experiments in mixing wheat straw with bamboo pulp for making newsprint and also has succeeded in using domestic wood and wheat pulp. Tung trees are being grown. Medicinal herbs are getting much commercial attention.

Chile. A company has been formed to turn out 30,000 tons of potassium salts annually. There is governmental interest in establishing an industry for producing iodine derivatives. The question of additional cement plants is being studied. A Chilean steel factory will use a process employing finely ground iron ore mixed with charcoal, calcium carbonate, and alunite. The government is investigating a project for the manufacture of aluminum from aluminum sulfate, which is plentiful. A rayon factory has been erected at Quillota, using eucalyptus. The Instituto Médico-Técnico Sanitas is manufacturing some aniline dyes. An olive oil plant has been built. Fennel and boldu oils can be produced if markets are found.

Colombia. Undeveloped beryl deposits exist in Cundinamarca. A soda plant is to be constructed at one of the government-owned salt mines. Abarco, a hardwood, is said to be a practical substitute for teak. Tanners are seeking a substitute for formaldehyde as a pigment-fixing agent in the production of shoe leather.

Cuba. The Minister of Agriculture announced the establishment of a Laboratory of Mines, equipped to make analyses and experiments and to serve as a source of data on domestic mineral deposits. A company was organized for deriving motor fuel and other products from asphalt. To aid farmers and to test new varieties of seeds, a horticultural demonstration station was founded at El Cano. Sugarcane research has brought out that difficult clarification results if the nutrition of the plants is unbalanced. The government is encouraging the production of textile fibers, particularly ramie.

Guatemala. The government is investigating cultivation of cinchona, derris, guaiac, paprika, and valerian. Plantations of cinchona trees have been set out, provided by American capital. The tea plantations are capable of much expansion.

Mexico. The problem of building an adequate iron and steel industry has been studied. At present one company is producing pig iron; two other concerns are making steel from scrap. The Governments of Mexico and the United States have been cooperating in a survey to determine prospects for expanding the output of Mexican crops. Coyol nuts are cracked mechanically to provide a substitute for coconut oil; a similar replacer for the latter is Costa Rican royal palm oil. The Mexican production of candelilla wax ranges from 1,500 to 2,000 tons annually. A shark-liver industry has been started in Lower California.

Peru. The employment of river shells in the manufacture of buttons and other articles has been considered. A pilot electrolytic zinc refinery was started at Oroya. Peru has joined the ranks of fiber flax raisers, with a crop of about 500 tons. Energy is being devoted to methods that

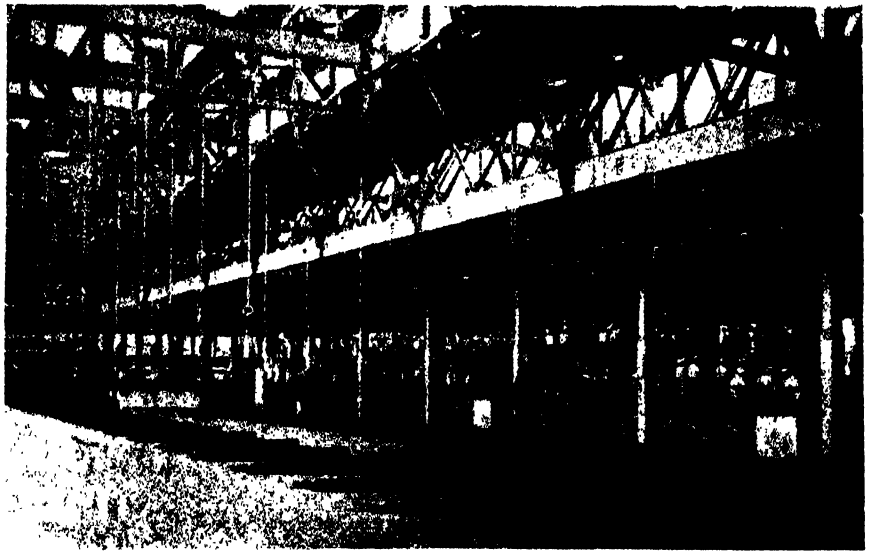
ARGENTINE INFORMATION BUREAU

State oil wells on the eastern Argentine coast

ARGENTINE INFORMATION BUREAU

A corner in an electric light bulb factory in Argentina

will result in higher yield and lower cost in rubber production. The National Institute of Animal Biology was created by the government. Ten tanners have made steady progress in recent years.



Great Britain

Scientific research in Britain's war effort has three main pillars—the Department of Scientific and Industrial Research, the Medical Research Council, and the Agricultural Research Council. Some twenty fields are being given associative investigation under the auspices of the department. Two research associations have annual expenditures of £100,000. The government is cooperating with the United States in scientific matters pertaining to national welfare. An Engineering Advisory Committee was appointed to assist in solving engineering problems connected with the war. The British Standards Institution issued emergency specifications to meet conditions from restrictions in the supply of materials and also advice on fire-detection devices for combating incendiary bombs. The Gas Research Board was formed. Approximately 14,000 persons are listed on the Ministry of Labour's register of chemists. The chemical industry continues to meet essential requirements, but a number of important materials must be imported, including pyrite, phosphates, and potash. A Chemical Control Board is engaged in coordinating the work of the various raw material controls. Women account for 23 per cent of all labor in British chemical plants. In 137,294 factories, in each of which less than 250 persons are employed, representing 52 per cent of the workpeople of the country, there is no industrial medical service. The maintenance of ventilation in plants has been defined because the application of blackout measures brought about an increase of accidents from gas and fumes. Ozone is used in some air-raid shelters.

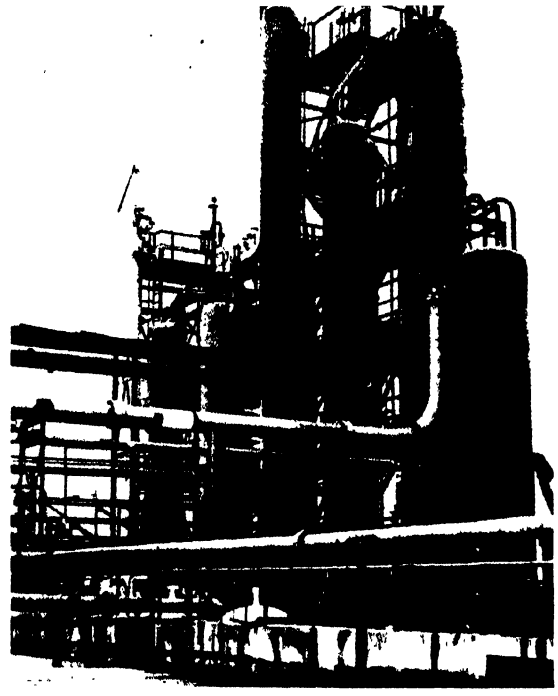
Coal, Coke, and Petroleum

The proposal has been made that coal seams of low range be exploited by underground gasification, as in the U. S. S. R. The mild degradation of lump coal was investigated with the help of the general knowledge of coal breakage. Starch flocculants are used in the removal of pyrite from coal-washery refuse. The disadvantages of hydrogenating low-rank coals are said to be less than anticipated. In the purification of water gas and coke-oven gas, peat containing sulfur bacteria is employed with iron oxide. Gas undertakings are seeking to combine more hydrogen sulfide as ammonium sulfide in their ammoniacal liquor. Much remains to be done in developing a satisfactory method of coking pitch. The possibilities of the



ODHAM FROM BLACK STAR

A fair munition worker sewing up bags of cordite in Woolwich Arsenal

process of activating coke with sodium carbonate are in need of research.

Apparatus for the recovery of light oil from the gas produced in small works is an important recent development. Picric acid was suggested as a retarding agent in the building up of resinous deposits within benzene still columns. Coumarone-indene resin is now being produced. A report was published on possibilities of utilizing home-produced fuels for Diesel engines; Scottish light creosote is being employed satisfactorily in road-transport Diesels. A method was evolved for preparing β-methyl-naphthalene from tar oil. The 3,4-benzophenanthrene compounds are more active carcinogenically than the benzanthracenes. For the use of methane as an airplane fuel a satisfactory container for the liquefied gas is needed. In motor vehicles a supply of compressed methane is preferable to storage in a balloon on the roof. Methane is obtainable in Scotland. It was rumored that the discovery of a method of obtaining large quantities of petroleum by synthesis was imminent. Asbestos shields on lifeboats of tankers protect crews from torpedoed ships surrounded by burning oil and can also be used as sails. Studies became available on the separation of paraffin waxes, on improvement of mixed cresols for inhibitor purposes, and on the effect of alkyl substitutions on the efficiency of phenols as inhibitors of gum formation. Mesitol as an inhibitor of gum formation in Iranian cracked gasoline was six times as efficient as *o*-cresol. In low-octane blends the addition of small proportions of furan caused a big rise in octane number. Attention was given to the reclamation of used lubricating oils. Swift Oil and the Adcols are metal-cutting lubricants. Clock Oil R.304 has been evolved by Stafford Allen and Sons in conjunction with the Admiralty Research Laboratory. Lubrivac is a vacuum-joint grease. A mode of applying asphalt by spraying a powdered compound through a flame-gun was described. Ledphalt damp courses consist of bituminous sheeting interleaved with lead.

Ceramic Products

A magnesite from Kenya was found to be an excellent substitute for the Swedish material. Diatomite from Kenya and the Shetlands and vermiculite from Kenya and Western Australia have good possibilities. Necophyl is a china clay; Stockalite and Devolite are colloidal kaolins. In Supreme kaolin 70 per cent of the particles are not above 1 micron in size; Speswhite kaolin has 50 per cent of its particles not larger than 1 micron. Talcolin is a mixture of Speswhite and talc; Talcolite is a low oil-absorption material of similar type. Kalytes is finely ground

ODHAM FROM BLACK STAR

A 60-ton acid open-hearth furnace at the Vickers Works in Sheffield

Cornish chinastone; Molochite is a calcined china clay used as a refractory. Fullogel is a treated fuller's earth, a substitute for bentonite. The Building Research Board issued reports on general principles of wartime building and on precautions for concreting and bricklaying in cold weather. Included in the shipbuilding program are a number of concrete vessels. Elcol is an oil dressing for dustproofing concrete. Porsulex is a plaster-composition roofing slab. The war has given a decided impetus to the use of chemical stoneware in the manufacture of foods, paper, textiles, dyestuffs, soaps, and cosmetics. The resistance to thermal shock of semidry pressed bricks is greater than that of wet-plastic products. Molten and vaporized magnesium disintegrates silicon carbide refractories by forming magnesium silicide. The search for satisfactory one-coat enamels has continued; consequently much study has been given to opacifiers. Glazes containing natural rutile or artificial titania are liable to become blue upon firing in oxidizing conditions. Lewcoglass is glass-insulated wire. Thousands of pre-stressed- or toughened-glass insulators are performing better than the old-type annealed glass products. Toughened glass is being considered for hot plates and tops of hot kitchen cabinets. Hysil is a heat- and chemical-resistant glass used in lubricated glass valves. The application of glass in reinforcing concrete was found suitable for static but not impact loads. At least 50 per cent of window surface must be covered with a suitable protective agent to prevent splintering of glass subjected to blast. There are about 80 replacers for glass in panes; cotton-net fabric impregnated with cellulose acetate is widely used. Surface mirrors of rhodium, chromium, and silicon were studied.

Metals

The Rakos electric fusion welding process is being tried for industrial purposes. Chemag is an immersion process for preserving and coloring ferrous surfaces. Nicosilal is a special cast iron for use in tar stills, said to give three times the service of stainless steel; Nicosilal and Ni-Resist have good resistance to deflection at 850° C. Tantiron Special contains not less than 16 per cent silicon, equal to Krupp Thermisilid E in practical properties. Ferrocite automobile valve guides are made from iron powder. Phosphates, either alone or in conjunction with silicates, are being favored by platers for cleaning steel. Creep-resisting steels of carbon-molybdenum and chromium-molybdenum compositions were described. The chromium - molybdenum steels are particularly useful for autoclave bodies: Hecla 153 is of this type. The formation of martensite is an important cause of failure in haulage cables. Koolex is an incendiary-bomb extinguisher. Quenching stresses in aluminum alloys and also unsoundness in gravity die-cast silicon-aluminum alloy pistons were investigated. Research was published on the constitution of alloys of aluminum with magnesium and silicon. In melting magnesium, fluxes comprising magnesium chloride, magnesium fluoride, and calcium fluoride are employed. A promising method of magnesium recovery is based on the use of a high-frequency induction furnace and a solid reducing agent, such as ferrosilicon or calcium carbide. Magnesium sheets made by rolling direct from castings have mechanical properties at least equal if not superior to those manufactured from extruded slabs. Antimony-magnesium alloys are readily melted and easily cast, but antimony does not cause any improvement in the mechanical properties or corrosion-resistance of magnesium.

The British Non-Ferrous Metals Research Association is investigating the character of the oxide film on aluminum-base magnesium-aluminum alloys and the influence of selenium and tellurium on the properties of copper. I. C. I. scientists studied the influence of crystal structure on the cold rolling and annealing of copper strip. An investigation was made of the effect of prolonged heating on copper wire. Silbralloy (Ag-Cu-P) is suitable for joints on copper and copper-base alloys excluding cupronickel. L. M. S. Railway released a report on the corrosion of copper and some copper alloys in atmospheres highly polluted with coal smoke.

Shipbuilding on the Clyde

Precipitation in copper-beryllium alloys was studied. Substantial interest has been shown in electrical contacts of tungsten copper made by powder metallurgy. Alloys of zinc 60, manganese 25, and copper 15 per cent in the extruded form have exceptional machining properties. A study was conducted on the effects of progressively increasing amounts of cold work on the properties of phosphor-bronzes. The causes of porosity in tin-bronze castings were investigated. Speculum plating is obtained by the electrodeposition of a tin-copper alloy containing about 45 per cent of tin. Bronzes with good properties have been made by adding aluminum to tin-rich bronzes. A process was developed for coating hardened lead foil with tin. An alloy of 91.35 per cent tin, 8.5 per cent zinc, and 0.15 per cent nickel was found to yield a strong and ductile foil. A new bearing alloy of tin is for employment in sea water. In nitriding, tin is being used to provide temporary protection to surfaces which have to be kept in an unhardened state, so that they are still machinable after the rest of the surface has been hardened. Ersin is a resin-cored solder. Progress is being accomplished in finding alternatives to palm oil and tallow as covers for tinning baths by adding fluxing agents to mineral oils. A protective film is produced on tin plate by immersion in a hot chromic acid solution after preliminary degreasing, or by immersion in hot alkaline phosphate–chromate solution, which simultaneously degreases and films the tin plate. Designs are being worked out for automatic plant for the oxide-filming of cans. For export purposes, a flattenable tin can has been developed.

BRITISH PRESS SERVICE

Working on 40-mm. guns for countering low-flying attacks

Chemicals

The Chemical Society introduced a scheme to facilitate the supply of fine chemicals. Studies of sensitized explosions were published by the Royal Society. Liquid nitrogen tetroxide and liquid nitrosyl chloride were put on the market. Kessler-type concentrators have been improved so that they produce 97 to 98 per cent acid from spent mixed acid with about 13 per cent fuel consumption. Base-exchange materials were prepared from domestic fuller's earth and glauconitic sand. The Ministry of Aircraft Production specified triethanolamine phosphate as the inhibitor for ethylene glycol. Galanthol is an ice-formation preventive for aircraft. Halothenes are halogenated derivatives of polythenes. Magnesium, calcium, and barium salts increase just as readily as sodium salts the detergent power of products of the sulfonated alcohol type but are effective in lower concentrations. The S. A. F. E. process for bleaching palm oil employs sulfuric acid and fuller's earth. Research on fats was continued at Liverpool University with aid from the industries. Mixed fatty acids and naphthenic acid are serving occasionally for stearic acid. Use of accelerators with antiaging properties reduces the consumption of antioxidants. Nipantiox is a group of esters employed as antioxidants in oils and fats. Synthetic menthol was introduced. Monochlorothymol is effective in preserving starches, casein, and glues. Penicillin has been stressed as a bactericide. Pressure distillate is a good antimalarial oil. An antiseptic with the physical properties of spindle oil is needed for hospital floors. Ylangone is synthetic ylang-ylang oil. The Imperial Institute published a survey of wartime drug supplies and empire production; the Medical Research Council issued a report on economy in the use of drugs in wartime; the Ministry of Health has been studying the cultivation and collection of vegetable drugs; a special section within the Ministry of Supply is concerned exclusively with drugs and medicinal chemicals. The cultivation of drug-producing plants is being encouraged by the Pharmaceutical Society and the Ministry of Agriculture, and nine commercial drug-plant farms are in operation. It appears that cascara sagrada and also ergot, gentian, dill, and lobelia can be produced. In Scotland school children are collecting medicinal plants. Therapeutic Research Corp. has been formed by five pharmaceutical manufacturers.

Foods

To hasten the application of promising research results to farming practice is the task set to the Agricultural Improvement Council. The dietary has required on British yields about 1.6 acres of land per head of population, while in Germany 1 acre of land feeds an individual. The I. C. I. agricultural research station is collaborating with the government in attempting to increase domestic food production. Mobile canning units are in operation. Instructions for the protection of food from contamination by poison gas have been disseminated. Ammonium bicarbonate has been proposed as a wartime alternative to ammonium sulfate as a fertilizer. Research has been undertaken on the effect of low temperatures in preventing damage to wheat stored with high moisture content. Unground wheat starches contain a small quantity of water-soluble material of high reducing power. Wheat starch ground dry in a ball mill for 2,000 hours is almost completely soluble in cold water. Results obtained on commercial batches of vitaminized bread indicated a loss of B_1 during manufacture of not more than 10 per cent. A large vitamin B_1 plant was started at Welwyn Garden City. B_1 increases the anaerobic fermentation of baker's yeast. Exposure of living yeast cells to ultraviolet light results in the liberation of nitrogenous materials that stimulate growth. It has been urged that more rye be grown and that more potato flour be produced. British people are being encouraged to use more potato flour as a food. It is believed potato starch might be utilized extensively as a source of glucose. A high nitrogen and low potassium ratio in the soil or fertilizer will cause blackening of cooked potatoes. Dried carrot meal might be of value in biscuits; inclusion of carrot in marmalade has been suggested as a war

measure. The Ministry of Food has proposed the use of sodium bicarbonate for cooking fruit to reduce sugar consumption. Depectinized purees are dried to make satisfactory fruit powders; plum powder can be made into jam at any time of the year. Black currant sirup is said to contain five times as much vitamin C as orange juice; the employment of hedgerow products as sources of vitamin C is being encouraged. It has been suggested that for food purposes the opium-poppy would be an appropriate crop; the seeds contain about 50 per cent of edible oil and 20 per cent of protein. Bracken roots may be converted into protein with the aid of *Torula utilis*. Straw-pulp plants installed on farms by I. C. I. number about 250. Waste food is dried for use as animal fodder. Factories for converting seaweed into cattle and poultry feeds may soon be set up in West Scotland. Macova is an egg substitute; Alimil is a powdered dried milk; Yolac is a preparation of soybean flour and dried milk. Addition of 0.3 per cent of lactic acid prevents softening of pickles. The cheese-making industry is to be cultivated by the application of rheological methods. A product for the baking industry has been originated in Scotland from cheese whey. In nature the heat required by a colony of bees is produced by the consumption of honey, an expensive fuel; hence it is thought the electric heating of beehives might be of advantage.

Paper and Leather

Bothered with "showing through", resulting from the use of thinner pages necessitated by rationing, periodicals have solved the problem by adopting titanium-treated paper. Pectate pigments may be employed in printing inks. Bracken was studied for papermaking purposes. At Leeds University it was found possible to produce satisfactory paper from strawy rhubarb. Young teak does not yield an easily bleachable pulp, it was learned in experiments for Trinidad plantations. The effect of a large number of naturally occurring gums and mucilages in dispersing long-fibered pulps has been examined: among the most successful deflocculants are such gums as deacetylated karaya and bassora, and mucilages from rosemallow, marshmallow, cactus, and hyacinth. Acetylation makes kraft pulp more difficult to disintegrate. Waste paper recovery has gained more and more response. Blends of paraffin wax with liquid oxidized rubber and isomerized rubber are suggested as coating agents for paper cartons. Castwood is a woodcrete or artificial wood, especially for use in unsinkable packing cases. Mellopad is a constructional material consisting of laminated strips of lead and wood pulp. Secolith is a bituminized building board. Ilford Multigrade photographic paper is coated with an emulsion, part of which is not color-sensitized, while the remainder is sensitized to the blue-green region of the spectrum. Chloral hydrate is useful in restoring documents "knocked out" by fire. Some 3,000,000 acres in Great Britain is woodland; accordingly there is opportunity to build better markets for firewood and charcoal as well as turnery timber. A synthetic tannin is obtained by fusing phenol with alkali and sulfur. A modified two-bath chrome tanning process was described. In manufacturing chrome-tanned leather under a strict wartime economy, reduction of dichromate with sulfur dioxide is the best method of preparing one-bath liquors. Use of wool grease is suggested as a substitute for cod oil and tallow in currying and stuffing leather. In oil-tanning, water in the pelts may be dispersed in the oil during processing and removed during heating-off.

Textiles

The Textile Institute published a report on the identification of fibers. Ramie can be processed on flax-preparing and -spinning machinery, if suitably degummed, without impairing the properties of the fiber. Palfpap is a sheet of jute cloth, paper, and bitumen for use in building to replace glass. Meritex is impregnated felt for roofing. The rate of transmission of heat through fabrics was measured. The dissolution of chemically modified cotton cellulose in alkaline solutions continued to get research. Mercerizing of cotton was claimed to be improved by replacing caustic alkali with silicate of soda. I. C. I. developed a method of rotproofing sandbags by saturating the fibers in a basic copper carbonate suspension. Micronil is a series of aqueous zinc and copper naphthenate emulsions for the protection of textiles against deterioration by exposure and rot. The sodium salt of oleyl-*N*-methyltaurine has been found effective as an auxiliary agent in the processing of cotton. A method for dyeing cotton with mineral khaki consists of development of the pigment with potassium chromate and washing the dyed material for at least 24 hours. To combat attack by microorganisms, the pigment on mineral khaki-dyed yarn should be neutral and contain an appreciable amount of chromium soluble in warm 10 per cent sodium hydroxide. A preparation enables wool printers to produce as bright colors as are obtained on other fabrics. The bisulfite-papain treatment is particularly advantageous for the treatment of silk-wool fabrics; the silk is degummed and the wool is made nonfelting. Wheat and barley straw was advocated as a raw material for rayon. Synthetic resin and resin-starch finishes are useful, apart from crease-resistance properties, in avoiding shrinkage and in increasing durability of spun rayons. Certain tin compounds reduce the loss of strength of undyed cotton and rayon yarn on exposure to ultraviolet light. Cisalpha, Fibramine, and Lacisana are fibers of regenerated cellulose containing protein. Vistra XT, Lanusa, Floxalan, and spun-dyed Fibro are physically modified viscose staple fibers. Rayolanda X is obtained by introducing a synthetic resin into the viscose spinning mass; its special feature is its affinity for wool dyes; this fiber is suitable for admixture with wool. The range of shades offered in spun colored Fibro is being gradually increased. Lynophane is I. C. I. nylon. Nylon cordage is under specification by the Ministry of Aircraft Production. Beryllium alginate has been found to be the most satisfactory alginic salt for textile manufacture. Further stability may be found in an organic replacement of the carboxyl group, decomposition of which constitutes the principal weakness of the alginic acid molecule. Dyes containing sulfonic groups form insoluble precipitates with sapamines; this property is utilized for improving the fastness to water of dyed materials. The dyeing and processing of blackout curtains have continued to get attention. Azomel A is a dispersing and wetting agent for pasting and dissolving Brenthols. Lamoa T. S. is used in the kier boiling or scouring of fabrics before dyeing. Perpentol is a kier boiling and bleaching assistant. Suedelaine and Luana are textile finishes. Tennace is an oil textile-softener. Raynamine is a textile softener; Raynaquol is a textile processing agent; Raynowex is a wetting-out agent. Flexo is a preparation for combating laddering and stranding in artificial silk materials. "Triple-three" is the crease-resisting finish of the Bradford Dyers' Association. Polythene is used as a glaze for chintz and similar materials. British Bead Printers apply urea resin as drops, in a prearranged pattern on a fabric, which on hardening give a beaded effect. Dellite is an emulsion giving films which resist mustard gas, gasoline, and water. Fabrone is a fireproofing preparation. Newtrell and Rayncoso are soaps for use in dry-cleaning. Daster is a white odorless wax extracted from Hartolan wool wax.

Rubber

The plantation rubber industry, of vital importance to Malaya and Ceylon, took steps to apply research methods with the object of raising the output per acre and reducing costs. The shortage of formic acid was overcome in Malaya by the adoption of acetic acid from Canada; the State Council of Ceylon authorized a pilot plant to produce acetic acid for use in coagulating rubber. The addition of fibrous pectate to latex accelerates creaming. Other innovations include special organic dyestuffs for marking uncured stocks of rubber and a method for deammoniating latex with formaldehyde. The rubber industry is searching for home-produced materials which can be used as substitutes for imported com-

pounding ingredients especially carbon black. Rubber armor has been found to protect persons exposed to air raids by taking up and dispersing the pressure wave. Molded rubber fenders are coming into increasing use on trucks and busses. Rayon tire cords are inferior to cotton in adhesion to rubber. Impregnation of rayon with a resin is useful; simultaneous impregnation with latex is desirable. A process for reclaiming rubber has been announced whereby the cotton is destroyed, the rubber plasticized, not by alkali, but by a secret agent, and the product is heated under pressure in the presence of oxygen. Semtex is a chemically resistant cementing material with a basis of specially treated latex. Alloprene is I. C. I. chlorinated rubber, similar to I. G. Pergut. Detel is a chlorinated rubber dissolved in a mixture of high-flash aromatic hydrocarbons for use as a corrosion-resistant paint. Isobutylene where highly polymerized resembles natural crepe rubber but deteriorates less on aging. It is expected that the supplemental development of synthetic rubber will have a stimulating effect on the processing of natural rubber.

Other Plastics

British Plywood Manufacturers set up a division for the production of major components and stressed parts of airplanes. Wood impregnated with plastic material is being used for the construction of airplane stamping dies. In aircraft, plastics are employed for undercarriage, hydraulic ram and pump, and power-operated gun-turret bearings. In the automobile industry 30 components of a car, including water pump, stub axle, pivot pin, and clutch thrust bearings, are made from plastics. In marine engineering, rudder post, stern tube, and pump bearings are manufactured from these materials. A company found that resinoid laminated fabric bearings lasted 10 times as long as bronze bearings; it was concluded that the savings in power consumption were approximately 25 to 30 per cent. Permali, a resin-impregnated laminated material, is employed as a supporting grid for holding mixing vessels. Pytram is a laminated cellulose material bonded with special adhesives. Work continued on the production of plastic pistons for internal-combustion engines. Use of metal powders may prove advantageous in outer layers of laminated plastics in moving parts to reduce wear and slip. Machines that could be run at 150 r. p. m. with metal cams have been speeded up to 450 to 500 r. p. m. by using plastic cams. Luminous plastics have attracted much interest. Cellulose acetate sheets containing a variety of fluorescent dyestuffs are available. Plassitil is glycerol monolactate-triacetate, used as a plasticizer for nitrocellulose and cellulose acetate. An architectural creation, Isol-umen, consists of a corrugated sheet of cellulose acetate cemented on another sheet. Isoflex is a multilayer insulating material made from cellulose acetate. Transparent cellulose and cellulose acetate films afford good antiscatter treatments for windows if film of adequate substance is suitably stuck to the glass. Lactophane is a cellulose sheet. Lassolite is a cellulose acetate sheet reinforced with cotton fabric for use as a glass substitute. Luxoid consists of woven glass fibers impregnated with a synthetic resin. Shieldex, a glass substitute, is reinforced synthetic resin sheet. Splindow and Visi-Lite are textile-fabric-reinforced cellulose acetate sheets. Wamilite is a glass substitute made of synthetic resin reinforced with cotton fabric or wire netting. Some 9,000 distinct molds are being produced to make available surface-hardened polystyrene eyeglass lenses for men in military service who must wear spectacles.

The use of phenolic plastic sheet in fish-plate insulators on the track of electrified lines is under close study by the B. S. I. and Electrical Research Association. In terms of phons the reduction of noise in factories by the use of phenolic plastic gears is about 65 per cent. Bakelite fabric pulleys appeared almost unchanged after 40 months of service with copper alloy wires in railway signals. Vinyl resins, either acetate, chloride, or co-polymer of both, will become increasingly employed in the future. Tenafoil is Tenaplas vinyl chloride in sheets or strips. Polyvinyl chloride extrusion compounds are in considerable demand by aircraft manufacturers; Welvic is a polyvinyl chloride resin. An excellent resin is formed by polymerizing the 3-component system vinyl ester–butadiene body–maleic ester. Perspex, the I. C. I. methyl methacrylate resin, has become a synonym for organic glass in the R. A. F. A process has been developed for melamine resins which, it is claimed, yields 90 per cent of the theoretical output and does away with the need for expensive high-pressure plant. Casein plastics are being used in the aircraft industry chiefly for the production of spacers, small handwheels, instrument knobs, and name plates; conduits made of such resins are employed on fighter planes. B. I. P. Beetle cement is widely utilized in plywood manufacture; a powder form was introduced during the year. Posamax is a casein of Argentine origin. Portex is a plastic for dentures. Duralain is a plastic electrical insulation. Filatex is a prepared textile filling material for use in plastics. Hair clippings are being collected for possible application in plastics technology. Work was published that threw light on the problem of chitin formation. Methods were reported for silvering plastics. Ardux is a cement for joining synthetic resins.

Paints and Varnishes

In the present conflict, camouflagists are aware of the importance of the principles of countershading and dazzle. An investigation of fluorescent and phosphorescent materials has been undertaken by the Civil Defence Research Committee. Luminous paints are of two basic types: the permanently luminous variety, which contains minute amounts of a radioactive substance, usually radiothorium or mesothorium; and the temporarily luminous type, which must first be activated by sunlight or ultraviolet. It is claimed that practically any pigment can be pro-

BRITISH PRESS SERVICE

Production of de Haviland Tiger Moth training planes

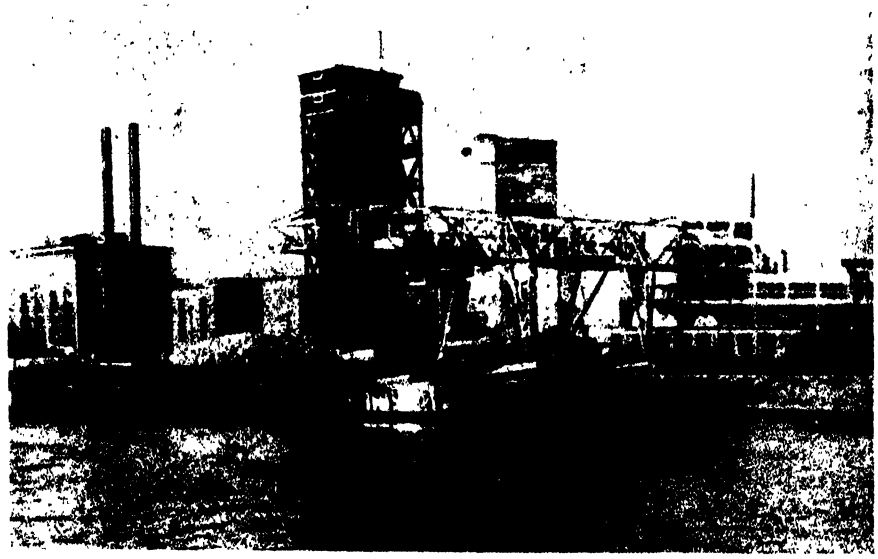
METCALF FROM BLACK STAR

A camouflaged model of a factory. The angle would be equivalent to an aerial view from about 500 feet. From a plane at a height of 10,000 feet the whole factory would likely dissolve almost entirely into the surrounding country. The object is to prevent telltale surfaces and shapes from catching the eye of an aviator flying at that height at a speed of 200 or more miles an hour.

duced in flake form by a new process. Webko is a whiting. Blancophone, another pigment, consists of 70 per cent barium sulfate and 30 per cent calcium carbonate. Tocarba is a titanium white for exterior use. A study was published on the gelation of polymerized linseed oil films in the presence of cobalt. Hyptis seed oil from Sudan and Nigeria was said to have possibilities as a linseed oil substitute. Tung oil from Nyasaland is evidently worthy of commercial development; the experimental plantations of tung trees started in Cyprus in 1931 have been making good progress. Doboline, octadecadienoic triglyceride, is a succedaneum for tung oil; Chi-Woo is another tung oil substitute. A thermosetting impregnating varnish consists of xylenol-formaldehyde resin and tung oil. A thermoplastic white-line material for roads is of promise. Sposs is a varnish to fill up pores in wood. Damasol is a purified dammar resin; Hal resin resembles dammar but is of inferior solubility. The Synolac resins are oil-modified glyptal products. The addition of 5 to 10 per cent toluene or higher alcohols to lac solutions prevents crazing for long periods. Plasticizers which prevent crazing do not also prevent blushing; plasticizers containing hydrophylic groups are unsatisfactory; hydroaromatic phthalates and tartrates are superior to the aliphatic esters. Pale colored resins have been produced from aconitic acid by simultaneous condensation with a terpene and a drying oil.

Eire

The government set up the Emergency Scientific Research Bureau, to deal with technical problems involved in the provision of substitute processes and materials. Activated charcoals were prepared from peat and two processes were developed for the manufacture of wallboard from seaweed.



Netherlands

The Cuma water-treating system consists of weak solutions of silver produced by electricity. Sulfur dioxide is used to control rinder scab of cattle. Liquid sulfur dioxide acts on certain oils as a hardening agent without benefit of hydrogen. Linseed oil, activated with sulfur dioxide, is much more sensitive to heat than the original oil, yielding stand oil in a comparatively short time without any extra catalyst. The heat stability of asphalt-rubber mixtures has been investigated. The kinetic characteristics of the oxidation of normal butane have been studied at 220° to 270°. The thermal decomposition of acetic acid esters is employed as a method for preparing unsaturated hydrocarbons; researches on pyrrole derivatives have also been pursued at Amsterdam.

Sorption of hydrogen by wool has all the characteristics of adsorption, but sorption of air is distinctly different, a process of chemosorption being set up. The dyeing of silk with an acid dye has been explained by density measurements. Intensely colored condensation products of isatin chloride with phenol, secondary amines, and aromatic tertiary amines have been prepared at Leiden. Parinarium oil has been described. Davitamon K is an extract from alfalfa. All yeasts investigated at Amsterdam contained free aneurin, originally present and not formed during processing.

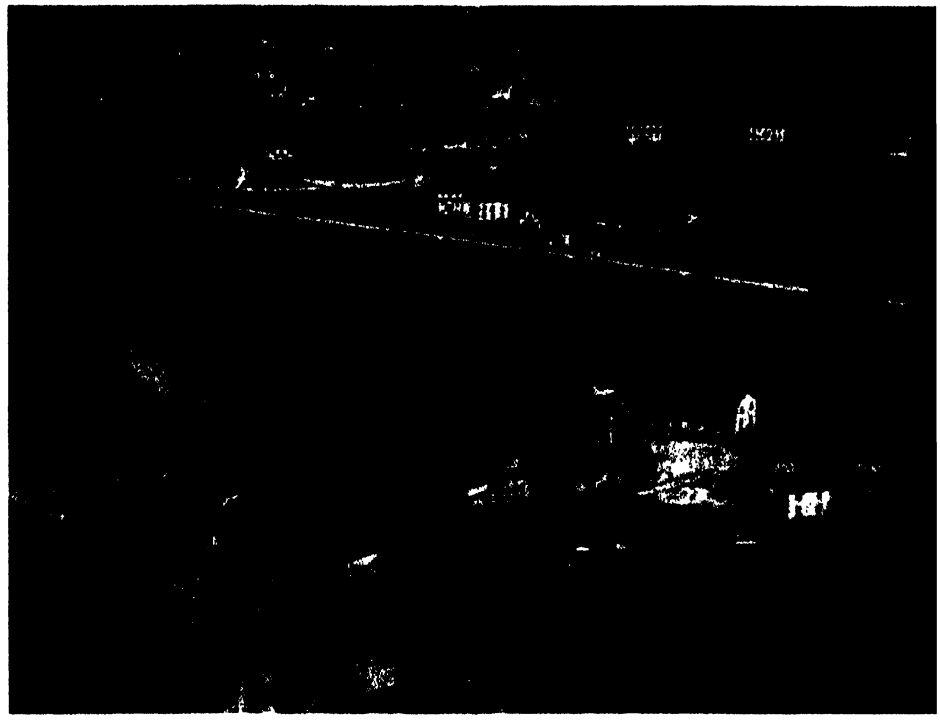
Belgium

An Antwerp company has been studying the more extensive use of gas for ve-

A sulfite cellulose plant in Strassburg

hicle propulsion. The linen industry is working at 70 per cent of normal output; it is the only branch of textiles for which raw material is available. An Ostend factory is making flour from grass, clover, and alfalfa; beet leaves and roots will be tried.

France



Peat is dried from 90 per cent moisture content to 15 to 18 per cent, briquetted, and then used as fuel for gas generators for automobiles. It has been urged that automotive producer gas be made from coal concentrated by flotation so as to ensure the highest quality motor fuel of this type A strong concrete is produced by incorporating sand and gravel in a special asphalt emulsion. Early in the year papers appeared on the basic Martin process and on the properties and uses of rare-earth metals and their compounds. Electrolytically prepared permanganate was reported to be cheaper than that made by straight chemical processes.

Researches were published on the synthesis of diacetone alcohol, on the ethers and esters of glycol and glycolic aldehyde, on the condensation of phenylacetic and phenylformylacetic esters, and on the nitration of cellulose. France is making plans for cellulose manufacture from straw and has a mill for producing fiber from Spanish broom. A process to modify viscose by reaction with formaldehyde in an acid medium compares with the tanning of proteins; it results in greater tensile strength of viscose where wet, reduced swelling, and resistance to wrinkling. The incorporation of dyes or pigments into the spinning solution has been studied: thus the color is dispersed throughout the formed thread and is fast to washing. Little progress has been made in the production of synthetic alcohol or of alcohol from hydrolyzed wood. Before being dried, a paper related, yeast must be washed with sodium carbonate to remove the bitter taste; drying can be done in vacuum or at normal pressure; finely dispersing the yeast by spraying or blowing in hot air gives good results; the water content should not exceed 8 per cent.

In Algeria olive oil is doing duty as a lubricant for machinery. North African milkweed is being studied as a source of a rubber substitute. Natural phosphates mined in French West Africa are being ground and applied to the soil, without acidulation, in an experimental way.

Spain

The production of manganese ore is in need of revivification. Efforts are being made to start aluminum and magnesium manufactures; provisions have been defined for the organization of an aeronautical industry. A national institute for housing has been authorized.

U S DEPARTMENT OF COMMEI

Yarzo plant of Società Fratelli Galtarossa of Milan where ferroalloys are produced by electric furnac

The Spanish National Rice Syndicate reported that cyanamide could be used for rice cultivation instead of ammonium sulfate. Methods have been developed to manufacture a fabric consisting of 20 per cent hemp and 80 per cent esparto for use in packing and shoes, to replace jute cloth. Work was started on a plant for producing cellulosic fibers from eucalyptus trees. Cork strippings are not expected to equal the 1940 total of 31,000 tons; the trees have been in better condition but labor problems have handicapped production. It is believed Spanish sources of essential oils and crude drugs will increase in importance. Some soaps are made from oil from cull filberts. Glycerol is to be obtained from green sulfur oil.

Italy

Molybdenum cast iron is used where the higher wear resistance after heat-treatment at 450° justifies the greater expense. In the stainless and heat-resistant steels, chromium-nickel steel is replaced by chromium and chromium-manganese steel, if necessary with the addition of a slight amount of nickel, or by chromium-molybdenum, chromium-silicon, or chromium-silicon-aluminum steel. A saving of tungsten in tool steels is effected by alloying with vanadium, molybdenum, or both these metals. By the melting-down of nickel coins withdrawn from circulation 4,500 tons of nickel have been recovered. A plant for obtaining vanadium oxide from bauxite is in operation; Italy produces about half its normal vanadium requirements.

Metals

A method of coating small objects by copper carbonyl was described. Research has been active in the production of pure zinc and zinc alloys. By alloying zinc with copper, aluminum, and magnesium in a total amount not exceeding 3 per cent, the metal Zama is produced. Small amounts of impurities increase the rate of corrosion of zinc alloys notably; copper improves tensile strength, elongation, and weldability; magnesium in zinc-aluminum and zinc-aluminum-copper alloys tends to counteract the injurious effect of any lead addition by retarding intercrystalline corrosion. Although Italy possesses considerable bauxite the country has conducted extensive experiments on the employment of leucite as an aluminum raw material: by such use it is hoped not only to supply a part of the aluminum requirement but also to obtain considerable quantities of potash salts. The utilization of alunite also has been considered. Magnesium production has been estimated to be around 1,800 tons a year, although it was announced the output would be 3,000 tons by the end of 1941. A government-sponsored concern in the Italian Alps is building a plant for the manufacture of metallic magnesium from local dolomite.

Fuels

The annual production of electric energy is some 17,000,000,000 kilowatts. The yield of gas in the fermentation of town refuse is about 90 liters per kilogram; the gas contains about 60 per cent of methane. A factory compressing 1,500 cubic meters

of methane a day began operation at Rovigo. Vetrocoke, Milan, installed a plant for recovering phenol from ammonia waters of its cokery and for compressing methane, and Vetrocoke, Venice, enlarged its works for distilling coal tar and producing methyl alcohol. Crushed coke with tar binder is formed into brick and used for the construction of pickling vats. Experiments have been carried out with coal gas as a fuel for airplanes. A pilot plant is extracting fuel oil from the asphalt-bearing rocks in Abruzzi; several new works have been erected for producing shale oil. A method of making isooctane in successful use consists in alkylation of butylene with isobutane in the presence of 98 per cent sulfuric acid.

Chemicals and Plastics

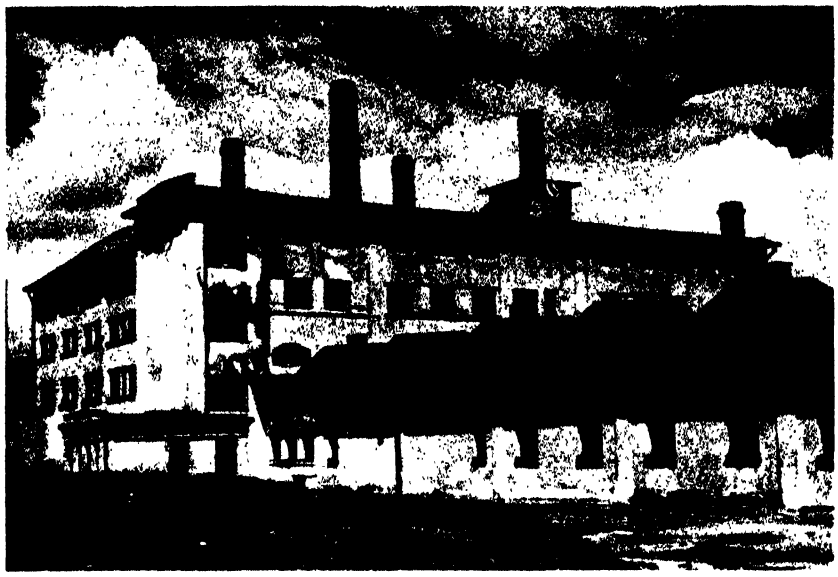
Porcelain containing sodium feldspar is less transparent than that containing potassium feldspar; thermal expansion is higher in sodium feldspar enamels. In 1933 Italy made only 70,000 tons of sulfuric acid, but with plants under construction or enlargement production in 1942 will be more than six times that quantity. A new factory for the annual output of 600,000 quintals of calcium carbide and cyanamide was opened. In the electrolytic production of sodium chlorate increased yields are obtained by acidification and by operating the cells under slight pressure. Italy produces 6,000 tons of borax and boric acid a year, consuming 3,000 tons at home. The oxalic acid plant of the A. C. N. A. was started. The Linate manufactory has maintained production of tartaric acid and hydrosulfite. The output of acetaldehyde, acetone, and acetic anhydride has been favorable. The manufacture of phthalic anhydride was increased further and the production of other coal-tar derivatives was considerable. Anthraquinone is being made satisfactorily by the catalytic oxidation of anthracene. A plant at Novara began the manufacture of polyamid resins. Fluosite, Reflite, Tessilite, and Fenoplast are phenolics; Gabrite is an aminoplastic; Xilocolla is an adhesive resin; Sibitle is an amino resin with a cellulose filler; Scarabeo, an amino resin with wood flour filler; Canevasit is used in gears, Isotex in bearings, Flexil in cable sheathing. The production of chlorovinyl resin (Vipla) has proceeded.

Plant Products

The cultivation of the castor plant is being encouraged; reports indicate that castor oil is to be used in the production of airplane lubricants. A new method for the chemical utilization of wood differs from that of Scholler in that the material to be decomposed is subjected only to preliminary treatment with acid, the actual decomposition being accomplished by means of superheated steam. By treating cellulose with solutions of sodium and potassium sulfides, the Na and K ions are adsorbed from the solution and an alkalicellulose is formed. The extraction of cellulose from the stems of sunflower has not given good results. Jutital is a jute substitute made from the Typha plant; Ginster is another jute replacer, to which authorities seem to attach more importance. Typha was tried without success in Germany during World War I, but a better method of decorticating the fiber has been evolved in Italy. The fiber of the lupines, either alone or mixed with jute, offers, it is thought, a suitable material for coarse fabrics, cord, and rope. Research progress has been effected in light-resisting dyestuffs and basic colors. The production of a new series of leather dyes was begun and advances were reported in the employment of soluble dyestuffs for acetate rayon. Nuova-Era is a tanning extract, a substitute for quebracho.

Italy is producing glycerol from treacle in the sugar factories of the Padua district. There will soon be a production of 10,000 tons of oil annually from grapeseeds. An experimental station is conducting research toward utilizing native essential oil plants. A process of treating wheat by electricity consists of the use of high-tension current generating an intermittent field to stimulate the reproductive qualities of the seeds. Organic compounds of mercury in many cases are more effective than copper salts in disinfecting and stimulating seeds. Cultures of several species of *Penicillium* and *Mucor* give yields of 15.45 to 25.4 per cent of fats (calculated on the dry weight of the mycelia). For the destruction of flies a mixture of molasses and sodium arsenate, called "miafonine", is used. Aluminum arsenate has been found practically as good as lead arsenate in control of codling moth on apples.

Switzerland



The leading task of the War Industries and Labor Office is to safeguard the raw materials supply and industrial production. The number of persons employed in the chemical industry has nearly trebled during the past 50 years. The Society of Chemical Industry in Basel has attributed its success under present conditions to a policy of decentralization.

Ninety-nine per cent of the buildings and homes are wired for electricity. It has been proposed to utilize the excess water power available in summer to generate and store heat for winter. The use of lignite has received inventive development. Plants have been authorized for liquid-fuel production from wood. The limited supplies of calcium carbide and methanol have rendered it necessary to restrict the number of motor vehicles operating with substitute fuels. Inability to obtain parts from the United States has tended to encourage local production of automotive equipment. The Secheron Works at Geneva has been active in improving electric welding apparatus. Steam-cleaning and lacquering make it possible to re-use undamaged old tin cans. A new machine for grinding high-grade precision lenses on a mass production basis has been developed at Aarau. Radiamant is a hard-metal substitute for bort. Studies have been reported on the recovery of nitrogen oxides with silica gel and on the chemical action of electric discharges.

Various restrictive measures pointed to a decline in output in the textile industry, notwithstanding a sustained demand for fabrics, but the first of three new staple-fiber plants commenced operation. The wetting agent Arosin has been investigated. Twenty factories produce about 30,000 tons of paperboard annually, mainly from old paper. An apparatus is available for cleaning and regenerating old and damaged motion-picture films. Plans have been approved for the construction of the first wood saccharification plant. Work on corn starch led to the study of amylose and amylopectin. Postonal, a polymer of ethylene oxide, is in use as a substitute for cacao butter. The production was begun of leathers which hitherto had not been available in sufficient quantity or suitable quality. Researches were continued on sesqui-, di-, and triterpenes. At Geneva the molecular weight and constitution of caoutchouc were studied. Investigations were published on amidon, steroids, vitamin F, and the enzymatic oxidation of carotin. Switzerland depends on imports for about one fourth of its food, particularly wheat, sugar, and feed grains. Swiss waters yield an average of 4,000,000 pounds of fish annually.

Hungary

Fuller's earth is improved by drying, boiling with water under pressure, and treating with mineral acids. Bentonite-like clays are used for laundering and in the place of cutting oils in the metal-working industry. Cacao butter has been replaced by a mixture of waxes and hydrogenated vegetable oils, mainly sunflower oil, which also serves as a substitute for sesame oil in many applications. Carthamus oil is available for producing soaps, varnishes, and margarine. Sheep tallow is preserved by treating with small amounts of sodium carbonate, hydrazine sulfate, and thymol. Condensation products of aromatic amines and aliphatic aldehydes are used in making resin preparations. A method tries to supersede wood tanniferous material in the leather industry by combining chromium compounds and extracts of sulfite waste liquors. Scrap leather is being utilized in the manufacture of leatherboard. Keratin can be transformed into various colored azo dyes. Nikotex is nicotine-extracted

Bohemian porcelain works, near Carlsbad

tobacco, out of which 7,000,000 cigars and 100,000,000 cigarets are made annually. The area planted in poppies has been enlarged considerably; it is claimed Hungarian poppies contain a third more morphine than those raised in Yugoslavia Turkey, or Macedonia. An ointment consisting of 3 parts glycerol, 2 gelatin, and 3 water is suitable for protecting the feet of animals in traversing land contaminated with mustard gas. A meat substitute concocted of 12 vegetables enables a dinner for four to be served at a cost of less than 20 cents.

Germany

The Association of German Engineers has been active in saving strategic materials, particularly fuels. Prizes are being offered for new machinery to speed up coal output in the direction of an ultimate goal of 10 tons a man per shift. By combining screening and electrostatic methods larger coal sizes can be cleaned without the use of wet processes. Research was carried out on coal-dust engines. To prevent glare from coke ovens during discharging at night the red-hot coke is covered by a screening hood. Large area smoke-screen installations have come into use over industrial cities. Coke dust is successfully added to gas and coking coals before carbonization. Benzene-scrubbing plants are using tar oil. The importance of low-temperature carbonization is attested by the fact that its annual production of tar exceeds 1,000,000 tons, of which 98 per cent is from treatment of lignite. A plant combines low-temperature carbonization with power generation: coke and excess gas are burned in the power plant; tar products are cracked to produce motor fuel. Peat treated with lime is used in place of slag in trickling filters (Ca-To process); Collactivit is usually made from sawdust, but a better product can be obtained from peat. Petroleum prospecting is going on in Hungary, Greece, and Bulgaria. Tixoton is bentonite prepared for employment in petroleum production. Germany has available about 50,000,000 barrels of crude petroleum a year from her own and controlled territory, with 80 per cent of this quantity coming from Rumania; in addition, there are 70 plants manufacturing oil from coal, making 36,500,000 barrels annually. Since 1938 the Reich has succeeded in trebling synthetic oil output; this product costs two to three times as much as natural petroleum. German planes have to fly mostly on 87 to 92 octane gas. An improved motor fuel has been obtained by heating benzene in an autoclave to 225° under a pressure of 20 to 25 atmospheres for several hours. More than 1,000,000 cubic meters of wood were distributed for motor fuel during the year. Acetyl benzoyl peroxide displayed a higher activity in Diesels than diacetone diperoxide where added to commercial gas oil. Mineral oil sulfonic acids and sulfonates are used in the production of emulsions, mainly for the textile industry; the free acids are applied in the splitting of fats. The catalytic reduction of naphthenic acids was studied.

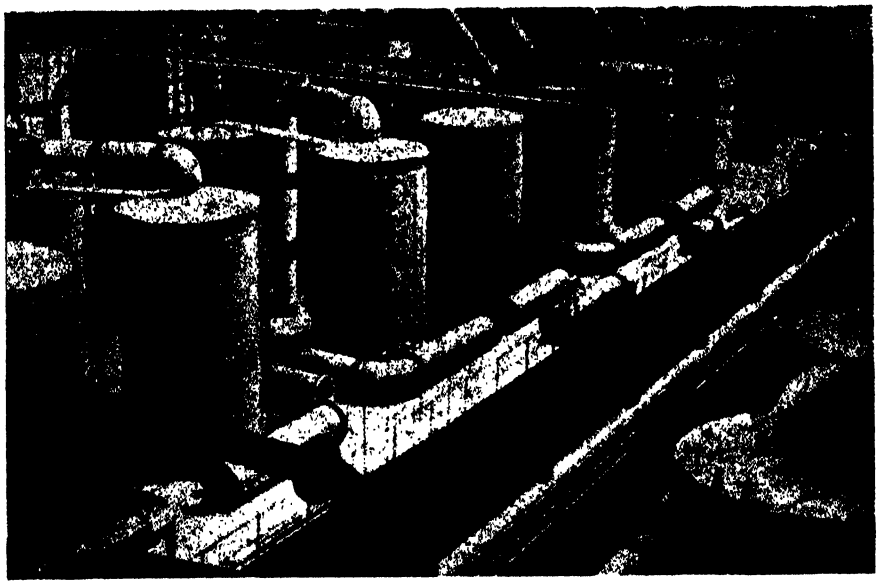
Ceramic Products

Ceramography has the same relationship to ceramics as metallography has to metallurgy. Work in black-marble quarries was found to entail no danger from silicosis and the examination of 251 slate workers revealed no signs of this disease. Slurries of kaolin, cement clinker, and lignite can be filtered much faster with the aid of konjak flour. Reinforced concrete tanks with plastic linings are replacing lead and coated wooden tanks. Asbestos-cement pipes are used in large and small sizes. A central bureau for controlling size and quality of brick products has been established in Berlin; its field especially covers light brick made of pumice and blast-furnace slag. A new carbon brick and mortar will withstand hydrofluoric acid and alkaline solutions. Silicon carbide brick is used in boiler plants. An exhaustive survey was made of possible compositions for chromite brick on the basis of constitution diagrams. Protective atmospheres in tunnel kilns may be attained by a suitable oil. Mixtures of iron powders with water and organic binders have been employed in laying magnesite or chrome-magnesite brick. Barium carbonate is a good enamel flux, does not greatly affect thermal expansion. The difficulties in making satisfactory white enamel without borax can be overcome to a great extent if prefused materials which act as fluxes are used, such as powdered glass and glass frits, as "milk glass meal". As an acid oxide titania is especially suitable as a substitute for borax. Zirconium

A metal works at Hamborn

silicate instead of tin oxide as an opacifier gives an enamel more resistant to impact. The homogeneity of a glass melt before refining is increased by briquetting the mix. Experiments on the effect of replacing soda by lithium carbonate in the smelting of soda-lime silicate glasses and the addition of lepidolite showed that the use of lithia as a constituent of the batch has advantages. A good decolorizer for glass contains magnesium chloride, barium peroxide, and fluorspar. Only Ultrasine and gray-green glasses gave effective ultraviolet protection. In sulfur and selenium glasses zinc oxide is able to combine sulfur and selenium to a pronounced extent. The cementing of glass plates to a transparent plastic interlayer is improved by application of a high-frequency electric current. A research institute was formed to work out improvements in safety glass and glass fiber manufacturing processes.

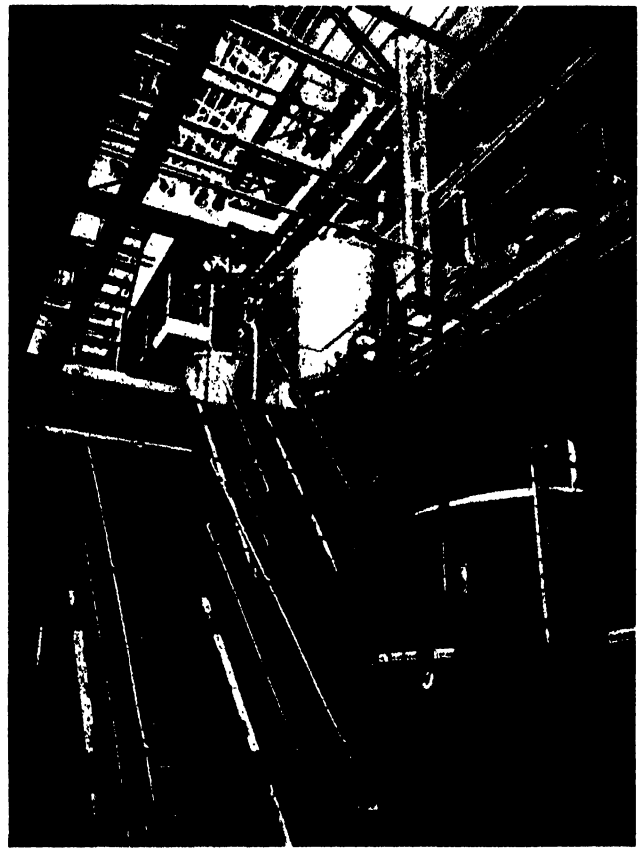
Iron and Steel



To produce arsenic-free iron, arsenic is best removed from the ore before reduction. Nitriding improves wear, especially in alloy cast irons. The addition of 5 per cent aluminum to cast iron increases its resistance to oxidizing gases at 800° to 875°, but to obtain the most satisfactory mechanical properties at temperatures up to 900° an aluminum content of 8 to 18 per cent is desirable. The properties of cerium-treated cast iron were studied. Mischmetal is used in tracer shells and bullets; the alloy is also utilized in photoelectric cells and detonators. Because of the superior heats of formation of the rare-earth oxides, Mischmetal has been proposed as a substitute for aluminum in thermite incendiary bombs. Future possibilities were considered in intensifying and hastening steel-making reactions through the use of the low-frequency stirring principle in conjunction with the arc furnace. Desulfurization of steel in basic-hearth furnaces must rest upon desulfurization of the fuel and an accurate proportioning of the fluxes. Many steel alloys have been developed especially for castings; castings of electric-furnace steel have been particularly successful. Hardening by brief immersion in a salt melt is applicable to any steel now treated by the torch method. A new hydrochloric acid–resistant steel contains 11 to 18 per cent antimony, 0.1 to 0.3 per cent beryllium, up to 5 per cent molybdenum, and 5 per cent tungsten. Manganese steels can be substituted for chromium-molybdenum airplane structural steels; whether they can replace chromium-nickel-molybdenum steels is not certain. In electric machines higher manganese steels have replaced manganese-nickel steels. Nickel carbonyl has been used in acid, open-hearth, basic electric, and induction melting operations for the production of steels, cast irons, and nonferrous alloys. Inkromizing is effected by the chrom-diffusion of steel with chromic chloride. Research has been done on the conditions to be met by carburizing agents for chromium steels. The use of nitrogen in chromium-manganese steel stabilizes the austenite and gives better processing properties; it also can be employed in place of nickel in chrome-nickel steels. Chromium-nickel austenite steel which contains tantalum and columbium carbides is superior to copper, iron, or aluminum for vessels for cracking fats and oils, for oxidation of paraffins, and for distillation processes. A search for inhibitors to lower acid consumption and avoid metal losses in pickling baths has brought out dibenzyl sulfoxide.

Other Metals

If plans are carried out, aluminum eventually will largely replace tin in the production of containers. About 93 per cent of the 250,000,000 tubes produced were of aluminum. Zinc foil has displaced tin foil for packaging cigarets. In an ingot-casting method for aluminum a special type of chill (cooled by circulating water) is lowered into the molten metal, which solidifies against it, and is then lifted out. Hydrokollag is a graphite dressing for facing chill molds for aluminum alloys. The Seo photographic process is applied on anodized aluminum. Aluminum can be protected by 0.05 to 0.1 per cent sodium fluosilicate against attack by dilute soda solutions. The eutectic aluminum-silicon alloy Silumin is unattacked by boiling linseed oil or fat acids. The corrosion resistance of aluminum-magnesium-silicon alloys is contingent upon purity; they must be free of copper and nickel. Anticorodal is aluminum-magnesium-silicon; Avional is aluminum-copper-magnesium. Alva 36 is a manganese-(copper, iron, silicon) aluminum alloy with additions of lead and antimony or calcium. In many cases brass wood screws can be replaced with such alloys as $ZnAl_4$, $ZnAl_4Cu_3Li$, $ZnCu_4$, $ZnAl_{15}$, $ZnAl_{10}Cu$. $ZnAl_4Cu_3$ is suitable for parts demanding high tensile strength and great hardness but where precise dimensions are not necessary; $ZnAl_4Cu$ is appropriate in apparatus requiring moderate strength and dimensional accuracy; and $ZnAl_4$ is adaptable where dimensional exactness is essential. Uses of magnesium include telephone switch parts, optical instruments, microscopes, and bus bars. Automobiles, streetcars, and tanks offer some of the most important outlets for magnesium alloys. Increasing employment of magnesium alloys in machine parts, railway and automotive vehicles, and aircraft has made strength a vital problem. The Elomag process (anodic oxidation in alkaline solutions) combined with subsequent lacquer impregnation provides good protection to magnesium. Neomagnal A is mainly magnesium, zinc, and aluminum; additions of manganese and silicon and sometimes lead are made. The three-component system aluminum-magnesium-manganese used as forging and casting alloys contains up to 2 per cent manganese and 15 per cent magnesium. Cuprema is copper tubing armored with resin-impregnated paper. Fused copper alloys can be freed from oxygen by treatment with briquets of 10 to 20 per cent red phosphorus and 90 to 80 per cent zinc. Aluminum has been largely supplanted by zinc in slide fasteners which are being used on military uniforms. To recover indium, zinc blende is roasted so that the indium is not volatilized in the oxidizing atmosphere. Aluminum wool, Sinterit, and Mundit are satisfactory for packing bell-and-spigot joints as substitutes for lead wool. A soft solder containing 6 to 8 per cent cadmium and small quantities of zinc, copper, tin, and phosphorus or arsenic compares favorably with the usual tin solder. Palid bearing alloys (11 per cent Sb maximum, 7 As, rest Pb) and Quarzal (15 per cent Cu maximum, 10 Si maximum, + Mn, Fe, Ni, Cr, Mo, rest Al) show promising bearing properties. Alloys containing approximately silver 80, manganese 10, and tin 10 per cent make electric resistors. Copper-tungsten contacts and aluminum-nickel magnets are offspring of powder metallurgy. New types of sifters are available for obtaining various grain sizes of powders.



Chemicals

It is known that large quantities of war gases are ready. New techniques would enable gas attacks on a wider scale than any seen in World War I; for instance, fleets of airplanes equipped with chemical tanks could spray large areas with vesicant liquids. That gas attack is regarded as possible at any time is evidenced by the fact that all the belligerent nations have equipped their armies with masks. Supersorbon is a carbon activated by the zinc chloride process. Several brands of dry cells contain activated carbon. The underground storage facilities in salt mines are being utilized in defense. Sodium is an excellent conductor of electricity and wires consisting of sodium cores provided with copper mantles have been finding increasing applications. Strontium carbonate is used to produce special alloy steels and in the manufacture of glass, ceramic glazes, and enamel. Strontium chloride powder is employed in refrigerators working on the solid absorption principle. Magno iron sol, iron hydroxide containing calcium and magnesium chlorides, in 10 per cent suspension, is being utilized for facilitating water softening in boiler operation and to remove oil emulsions from boiler water. A process for clarifying sewage by treatment with iron filings and carbon dioxide was tested. Reclaiming silver from used photographic fixing baths is said to be easier with a new I. G. product, Agfargan. Triolith U and Basilit U are Wolman salts treated with chromium compounds to decrease their solubility;

Evaporators for fertilizer salt at Ludwigshafen

Tanalith U and Basilit UA contain arsenic in addition. Tritox, trichloroacetic nitrile, is a fumigant. Glyzerogen is an I. G. glycerol substitute. Compounds based on triethanolamine are used to combat rancidity as induced by bacterial action. Zephyrol 345, for sterilization of surgical instruments, is an alkyldimethylbenzylammonium chloride. Sagrotan, an antiseptic, is a combination of saponified vegetable oils and *p*-chloro-*m*-cresol with *sym*-chloroxylenol. Neo-moscan, for dairy apparatus, is a mixture of soda, sodium silicate, and sodium hypochlorite. Microformin, used particularly in the fermentation industry, is a neutral, stabilized formaldehyde. The antiseptic properties of essential oils are increased by exposure to radiations of the wave lengths 3050 to 3075 Å. from a dihydroxyanthracene lamp. Soaps from crude tall oil may be used only for industrial purposes; more than 25 per cent tall oil usually leads to soft soaps. A sidelight to soap rationing is the trend toward electric razors. Dibromol, a bromo-isocyclic sulfonic acid derivative, is a dermal disinfectant. A substitute for tincture of iodine, Iodana, consists of complex bromine-iron rhodanides and methylated halogen phenols in a 10 per cent alcohol solution. New sulfonamides, such as Orsulan, were synthesized.

Indanthrene plant at Ludwigshafen

Foods

An Institute for Agricultural Labor Science investigates mechanization in farming. Another new establishment is concerned with vitamin testing and research. Manufacturers of margarine must incorporate vitamin A concentrate in their product. The consumption of vitamin C has increased since the outbreak of war; school children have been systematically supplied with tablets and the diet of the armed forces includes ascorbic acid in prepared foodstuffs. The use of fresh potato juice is recommended for feeding infants and children. Cabbage, spinach, carrot, or onion juice is added to dough to make noodles. Besides dried fruits and vegetables, such as dried sliced potatoes, army diet items embrace sauerkraut, dried and compressed to brick form, and powdered tomato soup, apple sauce, and marmalade, to which water is added prior to use. Vollsoja, a soybean flour, is employed to supplement other foods. Progress has been made in the quick-freezing process for preserving foodstuffs: 14 large refrigeration establishments are engaged in such work; in addition, there are 74 quick-freezing units in 27 canning factories and 67 in the course of construction. Hydrogen peroxide increases the germinative energy of barley. The processing of grape seeds has been extensively developed as a source of oil, and an annual production of over 1,500 tons is expected by simple pressing and by extraction by naphtha or trichloroethylene; the extracted oil is suitable for certain edible purposes. Table rapeseed oil was marketed on a large scale. Research is reported to have been successful in improving tobacco types. Approximately 3,000 tons of natural nicotine-free tobaccos were harvested for mixing with other tobaccos. Essences similar to hyacinth oil are obtained from tobacco blossoms; 100 kg. of seed yield 33 liters of oil, employed for food purposes. Peppery taste in foods can be obtained with derivatives of *o*-phenylvaleric acid. Artificial cinnamon consists of 96 per cent cinnamic aldehyde and 4 per cent eugenic acid, incorporated in a carrier made from pulverized shells of hazelnuts or almonds, colored yellow; about 0.2 per cent of natural cinnamon oil is added. Hog-raising establishments have been encouraged all over Germany. Some 1,500,000 kg. of kitchen wastes are being collected every day and about 300,000 hogs are being raised yearly at 1,308 establishments. Filtered lard is not so stable during storage as lard which has not been so treated. Barley and malt meals act as antioxidants to olive oil and lard. Pemmikan is a concentrated food for emergency rations, containing smoked meat, soybean flour, dried fruits, tomato pulp, whey, yeast, and lecithin. The nutritive value of seaweed meal is low. If bran is fermented with yeast it can be used in rations in place of fish meal. Bergin Holzhydrolyse, with government subsidy, has been experimenting to develop a suitable cattle fodder by wood sugarization. An announcement that eight cellulose fodder factories are to be erected indicates that this substitute will be used on a large scale. Mineral acids serve to preserve green fodder if a neutral protective agent is interlayered.

Paper and Leather

An institute was founded to furnish information on various woods. Wooden "hardware" for doors, windows, and furniture appeared on the market. Engineers are at work to achieve satisfactory substitutes for cork. Among the substances tested for this purpose are pressed peat boards, plates of slag and glass wool, pine bark, hemp scraps, and porous concrete. About 30,000 tons of paper are required annually for food-rationing cards. The consumption of wood for cellulose manufacture has more than doubled during the past four years, but the cellulose output has not been sufficient to fill the demand of the rayon and paper industries; therefore recourse has been had to increased utilization of straw and waste paper as raw materials. Collections of waste paper from households are carried on by school boys. Mill runs show that de-inked, regenerated paper can replace 50 per cent of the usual fresh stock. As little as 1.5 grams of sand in 10,000 kg. of paper can have a deleterious effect. The change from spruce to beech and pine for pulpwood has made further progress; beech is more readily ground than spruce, and power and steam consumption are low; foaming during the grinding process has been overcome by the addition of oleic acid. Peat serves satisfactorily as an auxiliary material (up to 20 per cent) in board manufacture. The preparation of cellulose from cornstalks is much easier than from wood sources. Potato tops are being pressed into briquets for use by paper factories; admixed with straw, potato tops are suitable for the manufacture of coated paper; periodicals are being printed on this Solanum paper.

Sulfate pulps from woods cooked with potassium hydroxide and potassium sulfide were superior in physical properties to the usual kraft pulps. The sulfite industry, with few exceptions, utilizes about 50 per cent of its raw material and discharges the remainder in dissolved form into sewers. The difficulty encountered in the digestion of pinewood by the sulfite process is not the result of colloid-chemical conditions but is attributable to the presence of phenols. In the main sulfite pulps are far more sensitive to heat than soda pulps. Sulfite pulp bleached with hypochlorite has superior sizing behavior. The purification of pulp at low temperatures was described. The fat acid portion of tall oil contained only oleic, linoleic, and linolenic acids. A combined sheet iron and cardboard pail is being used for jams. Cardboard is being employed wherever possible to replace wood in boxes. Neutralit is an insulating substance for containers. Transparit is a beech cellulose sausage casing. Ultrasan is used for increasing the whiteness of wrapping papers. Cigaret paper can be made with as much as 50 per cent wood pulp, but only with cheap and strictly neutral fillers. Recent improvements in the Duxochrome process for making color prints on paper with films dyed in manufacture are said to include a purer color in the yellow film and the addition of a gray print. The Colorprint process involves the preparation of wash-off relief matrices with special dyes and a tanning developer. Germany is using tanned rabbit skins for belts and handbags. Tschamba-fii new, with the composition $C_{18}H_{30}O_{11}N_2S_3Cl_3$, is a tanning agent. Palatine fast dyes with chromium bound complexly to the organic dye molecule tan hide substance in proportion to their chromium content. Three general types of substitutes for leather are: Fagelan, a woven fabric impregnated with a lacquer; Fabinette, consisting of at least 50 per cent fibrous filler embedded in suitable waterproof bonding material, such as Buna; and Nifarin, the filler of which is nonfibrous in nature. Elefant is another leather substitute and Neocor is a fiber-latex product for employment in place of leather. Panplast, essentially a felt, impregnated with a nitrocellulose composition so as to be permeable by air and moisture, is a succedent to leather and cork in orthopedic appliances.

Textiles

Research was conducted on the use of flax and hemp wastes for making staple rayon, manufacture of cellulose from lignite, use of chestnut wood, willow bark, hops and beanstalks as cellulose raw material, preparation of keratin from wool dust, human hair and natural silk waste, making of textile fibers from tendons and horse meat, and production of fish-skin leather. In the manufacture of Cellulon yarns, the moist cellulose is divided into ribbons on the paper machine and then spun. Xylolin is the name for yarns from cut spinning paper; Textilose and Textilit are mixtures made from paper and fibers. "Cell jute" is used to manufacture sacks for flour and sugar and for coverings for cell wool; it has also found applications in the linoleum, carpet, and cable industries. It is estimated that 200,000 to 300,000 tons of waste paper are used yearly to be spun into these containers. The dry strength of paper yarns can be increased 20 per cent with spinning softeners and 30 to 50 per cent with impregnating agents. Hop vines have been found to be a good source of fiber for textile and other uses. The strength, uniformity, and yields of green flax products are somewhat higher than those of materials from retted flax; the working costs are approximately the same. The Kaiser Wilhelm Institute for Bast-Fiber Research was set up. By a newly developed process rags are machined to a long-fibered product which can be spun to fine yarns. Successful experiments were recorded for dry-spinning viscose from aqueous solutions; a special aftertreatment is required to render the fiber water-insoluble and to impart orientation to the cellulose chains. Proteins lower the sorption and raise the crease-proofness of rayon; substantive dyes added to viscose spinning solution act similarly; like results are obtained if finely divided metallic hydroxides are introduced during spinning. Artilana is a rayon containing urea resin. Trocolen is a vinyl polymerizate for the textile industry. Casein fibers, e. g., Thiolan, cannot be fulled like wool, swelling rapidly and becoming sticky. Work has been done on improving protein fibers by the use of gelatin, wool and silk wastes, and algin. Fibers resembling hair or catgut and leatherlike films of fibrin have been prepared by addition of calcium chloride to diluted plasma, drying, treatment with formaldehyde and glycerol.

As substitutes for olein, mineral oil and compounds containing it are useful for general purposes but are deficient in the manufacture of army cloth and felt. Leonil WS can be used for washing wool in a neutral medium. Tylose HBR is a clear cellulose product whose addition prevents discoloration of fabrics by frequent washing. Servital OL is an oiling and fulling agent. Data were given on fulling agents made from soaps, fulling methods involving the use of Calgon, water-soluble spinning oils, as Servital OL, Thianol, and Lamepon SB, and textile assistants having fulling properties, as Me-dialan and Ceropon. Hydrophobing has no material effect in reducing ultimate shrinkage; it lessens resistance to abrasion and tear; it is used in conjunction with impregnation to obtain waterproof fabrics. Water-repelling impregnations embrace the Inflos process, involving the employment of high-molecular isocyanates in organic solvents, use of Persistol LA and LB in organic solvents, and incorporation of urea resins. Tylose 4S, a water-insoluble, alkali-soluble ether of cellulose, is a finishing agent for rayon. Appretan H is a synthetic hat-sizing material. Zinc oxide can be used in textile-finishing agents, acting not merely as a filler but also as a preservative. Amicrol has high germicidal power. Dullit RK combats fabric shine. Natural fibers take up pigment more uniformly along their surfaces than do synthetic fibers. New methods for dyeing vat colors were developed by I. G. to improve results on rayon and staple fiber.

Sulfonated seal-blubber, shark-liver, and herring oils, alone or mixed with sulfonated vegetable oils, can be utilized in dyeing and finishing rayon. The Pentazikon products are useful for the dyeing of staple rayon. Favorable results were obtained in dyeing cross spools by the employment of the leveling and dispersing agent Pentasikon TS, followed with Ribanat for the soaping treatment. Iridescent color effects can be produced by dyeing smooth fabrics in such a manner that the viscose-rayon warp and the acetate-rayon weft are given different colors. The preparation

of some fluorene azo dyestuffs was reported.

Elastomers

Guttasyn and similar products were endorsed for fabricating containers for explosives. Aside from use in automobile tire manufacture—the latest creation is a soft solid tire—Perbunan is being employed for ink rollers on printing presses, in replacing leather rollers in the textile industry, for hoses in oil refineries and gasoline stations, and as a covering for wiring and a lining for containers in the chemical industry. Perbunan is particularly useful for preventing accumulation of static electricity in belts, gasoline hose, and other products. The cost of producing synthetic rubber is about 40 cents per pound. Hard Buna is equal to hard rubber products in chemical and mechanical durability and superior in heat resistance. Filter plates and certain parts for rayon machinery are made of vulcanized Buna. For jacketing electric cables Buna shows better aging behavior than natural rubber and greater heat resistance. Brake linings composed of Buna loaded with aluminum wool were officially recommended. Suitable antioxidants of rubber are phenyl-β-naphthylamine, aldol-α-naphthylamine, p-aminophenol, and various diphenyldiamine compounds.

Other Plastics

Celluloid made from high-viscosity nitrocellulose has better strength properties than that made from nitrocellulose of low viscosity. Unlike metals, plastics such as are used in bearings do not provoke chemical changes in oils. Delignit is a resin-wood product employed in constructing wood-gas busses. Calypsol, a laminated plastic, is employed in bearings for reciprocating machine parts. Duastria, Faktosit, Haulanit, Jolosteen, and Pluvex are plastic packings. Duskon is a vinyl polymerizate for similar utilization; Luvican is a polymerized vinyl carbazole. Polyvinyl chloride is used for corrosion prevention in coils and jacket-linings of condensers, in stirrer arms, and in pipe linings. Vinidur is being welded by an air or gas current of 230° to 270°. Gears are made of laminated fabric impregnated with phenolic resin; gears being developed are fabricated from wood impregnated with phenolic resin and cured under pressure. Promising experiments have been carried out with Mipolam and Kuprema for cold-water conduit. Tee joints and special plumbing parts are available in a number of resins, as is resin-clad steel tubing. A domestic gas meter is made almost entirely of a phenol resin. For lacquers for the protection of metals plasticised phenol resins are considered satisfactory. Polystyrene (Trolitul), Luvican, Igelit MP and PCU (Astralon and Vinidur), Oppanol B, and Lupamid can be used for surface coatings for metals, storage-battery cases, surgical goods, and combs. Tromipaste is an Oppanol heavy textile impregnant. The characteristics of concentric Styroflex cables were investigated to determine their suitability for transmission of high-frequency energy. Trolitul and Amenit are utilized in high-frequency insulators; Trolitul is also employed in hydrofluoric acid containers. Type faces are being produced from resin obtained by interpolymerizing styrene with acrylic or methacrylic nitrile. There are five or six kinds of plastic tubes for holding pastes and liquids. Molded mudguards are utilized on motorcycles; molded phenolics are being used in the manufacture of carburetors. Iporka is a urea resin in the form of foamed sheets; glass fibers are added to increase its strength. Ethylbenzylanilin is a clarifier in producing transparent casein plastic. With emulsifying oils iridescent effects may be obtained in synthetic horn. Neohekolith, a thermoplastic mixed-ester polymeride, has been approved as a denture material. Artificial teeth made of methacrylate resin are under study. Research on the condensation of malonamide with formaldehyde yielded a hard resin. The tabletting of synthetic resins was investigated with special reference to fiber-filled molded products. Relief globes, slide rules, sewing machines, and shingles offer opportunities for plastics. The much discussed question of making invisible airplanes goes back to World War I when Cellon machines were flown by the Germans on the front. Uses of plastics in aviation are in laminated bullet-resisting windshields, transparent cockpit covers, and instrument panels.

Paints, Varnishes, and Lacquers

The outer surfaces of new buildings must be painted or plastered with dark colors. An industrial air-raid precaution making blacking-out of windows unnecessary is a luminescent paint for vital apparatus, activated by special lamps emitting hardly any visible rays, independent of the regular light current. The proportion of drying oil used in making paints can be reduced from 30 to around 10 per cent without impairing durability by utilizing pigments having less oil demand and by formulating with synthetic resins. Work has been active in seeking substitutes for linseed oil. Through careful selection, the oil content of an improved white lupine has been doubled in the past few years, but an entirely satisfactory process for refining the oil or for getting a good fiber along with increased oilseed yield has not yet been developed. The following seed oils were suggested for possible employment in varnishes and lacquers: blueberry, cranberry, burdock, wild lettuce, raspberry, blackberry, currant, haw, asparagus, tomato, pumpkin, henbane, buckthorn, and ash. Evidence indicates that the action of microorganisms on oil paints may bring about the liberation of free acids having a deleterious action on wood. Alkyd resins are being more and more used in the painting of iron. Copal ester in general increases the gloss and hardness of varnish films in which alkyd resins are present. Mechanical tests indicate that oil-lacquer films containing

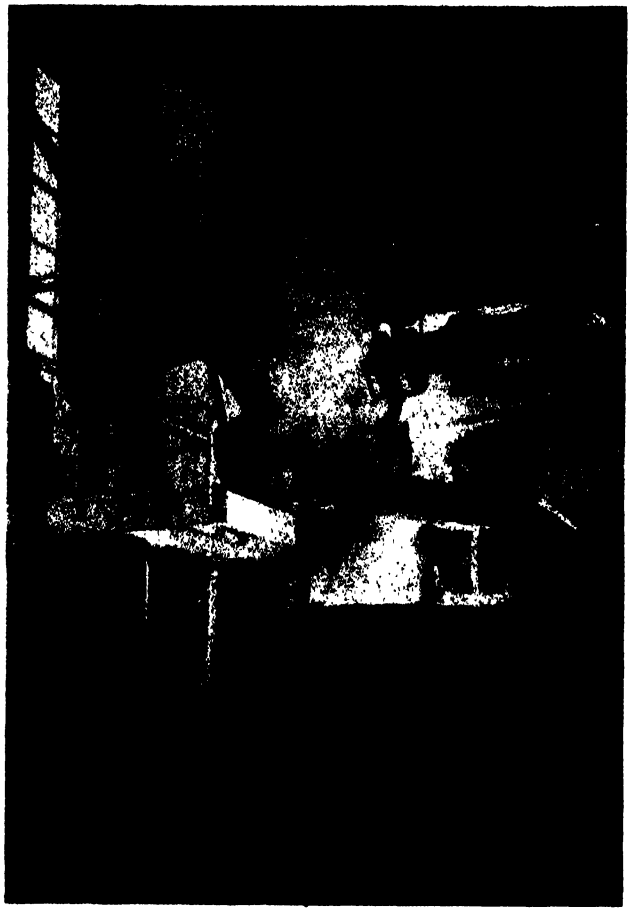
Danish flax mixed with hemp and reclaimed rope and paper is used in the rope factory at Randers. Efforts are being made to raise hemp.

so-called oil-reactive phenolic resins are comparable with those containing stand oil and have high water resistance. Soybean oil, though less suitable than castor oil as a nitrocellulose plasticizer, can be regarded as a partial replacer. Lacquer films containing soybean oil tend to yellow more quickly and to be less resistant to alkaline solutions. Chlorinated-rubber lacquers are resistant to benzene, mineral oils, alkalies, acids, and aggressive gases; linseed oil is used as a binder. Chlorinated rubber and polyvinyl chloride derivatives are being employed as components of bituminous paints. Demurag is a copal substitute; Mureg is a similar product. Mawag is a resin solvent. An aluminum-silicon alloy occasionally substitutes for lead pigments. Zinc ferrite is the rust-proofing ingredient of a new paint. Iron is rust-inhibited by paint containing carbon and ammonia.

Denmark

Iron ore discovered on the Island of Fyn is said to be as good as the Swedish product. A firm in Copenhagen is to manufacture a small electrically-driven commercial vehicle of local design. A new cargo vessel is driven by means of producer gas. A committee set up in Thisted has been investigating possibilities for constructing the first nitrogen fixation plant in Denmark. The formation of metal ammines was investigated fundamentally. A factory for the manufacture of insulating boards from peat was built in Jutland. Danish Sulfuric Acid & Superphosphate developed a new tar emulsion for road work. Substitutes for imported oilseeds are being sought; linseed output has been increased. The principal paint manufacturer is offering four clear oil-in-water emulsions and six pigmented emulsions for cement and wood work. Aluminum hydroxide is made for use in stable emulsions as a carrier for vaccines. The pharmaceutical industry is specializing in biological preparations. Raw materials have been available in abundance, owing to increased animal slaughterings. Experiments have been made on the extraction of pepsin and ventriculin. New medicinals of the year include sulfathiazole, three hormones, and dioxydiphenylhexadiene. The cultivation of peppermint, wormwood, thornapple, mullen, and henbane is being carried on.



Norway

Labradorite has been found utilizable for producing aluminum. Several thousand motor vehicles are equipped with gas generators. Pulp production has grown through increasing efficiency and capacity of plants rather than by building new ones. Good sizing of paper cannot be obtained if rosin is completely omitted and so far a satisfactory substitute for alum has not been secured. A staple fiber plant with a daily capacity of 20 to 25 tons has been authorized. Norway is said to be in a position to produce annually around 100,000 tons of cellulose fodder. Ordinary sulfite and sulfate wood pulp is subjected to a special cooking process designed to increase its digestibility; the product is then mixed with herring meal and other waste from the fish industry and with root vegetables. Pulps for foodstuff require different cooking conditions than for rayon or paper pulp, but it may be possible by a classifier to segregate sulfite pulp into fractions of which one is satisfactory for paper pulp and another suitable for feedstuff. Freed from lignin, wood cellulose is utilized by

Tapping a 14-ton arc furnace at the Sandvik, Sweden, steel works

horses and cattle, but not by pigs and poultry. Efforts are being largely centered on reducing raw material and processing costs to get products which satisfy feedstuff rather than pulp specifications.

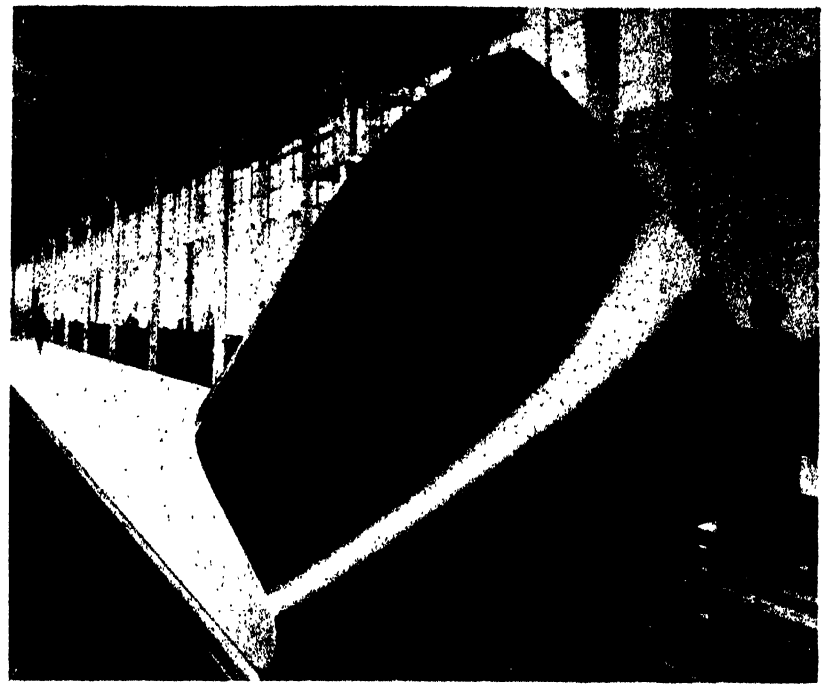
A factory for the manufacture of pressed fish has a process that is claimed to preserve the product for 10 years regardless of climatic conditions. Herring oil, from which the fishy taste has been removed, is used to replace olive oil. Three hundred thousand tons of seaweed are available yearly along the Norwegian coast, and utilization of this supply for feedstuff and also as a raw material for chemical processing has been discussed.

Sweden

A cement and concrete research institute has been established. Production of sponge iron has been increasing. New types of alloyed constructional steel having either very little or no nickel content have been developed. Experiments have been made to extract vanadium and also alumina and potash from spent oil shale. A plant has been planned for the production of alumina from andalusite: about 2 tons of andalusite are required for a ton of alumina; the silica content is troublesome. New deposits of copper have been uncovered. The airplane industry has been carrying on considerable extensions. Sweden's large armament works, Bofors, has been conducting research especially on developing new methods of by-product utilization, and acetanilide, saccharine, and nitrocellulose are being manufactured in consequence. Lithium has been added to the Boliden products.

Fuels and Lubricants

Since 1938 the Swedish State has been combating occupational diseases and promoting industrial hygiene. In a pottery factory it has been found that the working capacity rose by 11 per cent following the introduction of music hours. Dermatitis from handling explosives and also producer-gas poisoning have been under study. The number of producer-



SWEDISH-INTERNATIONAL PRESS BUREAU

Cold-rolled strip is bright-annealed in these electrically heated furnaces at the Sandvik, Sweden, steel works.

gas vehicles amounts to 65,000; about 60 per cent are operated on charcoal gas, while the remainder is wood-gas driven. Close to 3,000 tractors are run on charcoal or wood, which are also being employed in motorboats, fishing vessels, ferries, and stationary engines. A producer-gas fuel made by drying wood pulp is expected to increase the use of gas adapters in automobiles; experiments in which at least 30 per cent of the fuel consisted of wood pulp have proved satisfactory. Several big water-power plants are under construction. The manufacture of wind generators has been begun for use in homes for the generation of electric energy. Electrically driven automobiles and cycles have appeared in increasing numbers. In Stockholm a bakery is producing fuel for 50 cars and trucks from the alcohol vapors arising from bread ovens; the cost is about 33 cents a gallon. Peat production, which can be carried on only in summer, is calculated to amount to about 500,000 tons in 1941, but in 1942 it is hoped to attain about double that figure. The Parca semigas furnace has a peat or wood consumption about 25 per cent lower than older furnaces.

Feed pulp and alcohol are a combination, arising out of the present situation in the paper industry, to develop new openings for labor and new opportunities for profit because of the annulment of contracts for products with foreign countries. Three new plants have been built for producing fodder cellulose. Work has been started on the production of liquid fuel from wood; the output of sulfite alcohol and potato alcohol will be increased. Shale oil technology is also receiving attention. At present only about 3 tons of crude shale oil are produced daily, but the output will be enlarged in 1942 to at least 30 tons a day. It is expected that about 2,000 tons of lubricants will be made from wood tar during 1942. Experiments are being conducted with the object of making peat tar by reducing peat to coke, and from this tar it is hoped to produce gasoline and lubricating oils. Amex is a new oil reclaimer. A device has been marketed for saving lubricating oils from ships' bilge water. In combating shipworms all test blocks that had been treated with Boliden salt or with chromium or zinc arsenate were fully intact, while those treated with barium arsenate were badly damaged.

Paper and Textiles

Lignasan and Pulpasan are in use as wood pulp preservatives. Paper vests have been shipped to Belgium and France. The production of cigaret paper has been studied broadly. A new field where paper bags have found employment is as containers for fuel for producer-gas automobiles.

The wallboard industry comprises 14 mills with an annual capacity of about 150,000 tons. Wallboard is looked upon as the best substitute for windows smashed in air raids. The heating problem has prompted greater interest in insulation in various forms and the latest novelty, Wellit, consists of several layers of corrugated board, impregnated in a special way to render it impermeable by moisture. From tall oil a satisfactory washing soap is being produced. Rosin emulsions have been investigated as replacers of rosin soaps for paper sizing. Experiments recently completed have revealed improved methods of producing pine tar.

By using some hydroquinone or pyrocatechol with wood-tar phenols, hardenable resins are obtained. There has been a considerable increase in the output of rayon and a third factory was announced for the production of cell wool. Interest in flax cultivation has grown and a modern flax-preparation plant with laboratory facilities has been erected.

Agricultural Products

Domestic apatite is serving as a substitute for phosphate rock and research is in progress on the production of phosphates from apatite. A new sulfuric acid sprayer for exterminating weeds in oat fields entered the manufacturing stage. Practical silos have been designed for intermittent drying with electrically heated air or by cold air. An allied undertaking has been the drying of grasses; this work has been supplemented by studies of the effects of drying on straw fodder. Special attention has been given to the question of winter storing of potatoes and garden produce. A radio firm has been carrying on experiments with music in cow houses to ascertain the influence on milk production; beneficial effects were claimed in a preliminary study. A new type of dry-milk powder, produced by a method said to preserve all the natural properties and the entire nutritive value of milk, called S. M. P. milk, has become of value. Whey is being converted into a substitute for molasses in cattle feed and confectionery. The Swedish State Research Institute for Freshwater Fisheries is investigating catch methods and the prevention of stream pollution and piscatorial diseases. Yeast, it is claimed, can be preserved without drying by the addition of 2 per cent of Nipakombin (a mixture of the sodium salts of the ethyl and propyl esters of *p*-hydroxybenzoic acid). A committee is supervising the systematic provision of vitamins.

Finland

Water-gas production, with wood, lignite coke, peat, and cellulose by-products as fuel, has been discussed as a source of power which would also enable the domestic manufacture of methyl compounds. The impurities have been studied in the gases from charcoal and wood in portable generators used for operating automotive vehicles. A number of cases of poisoning

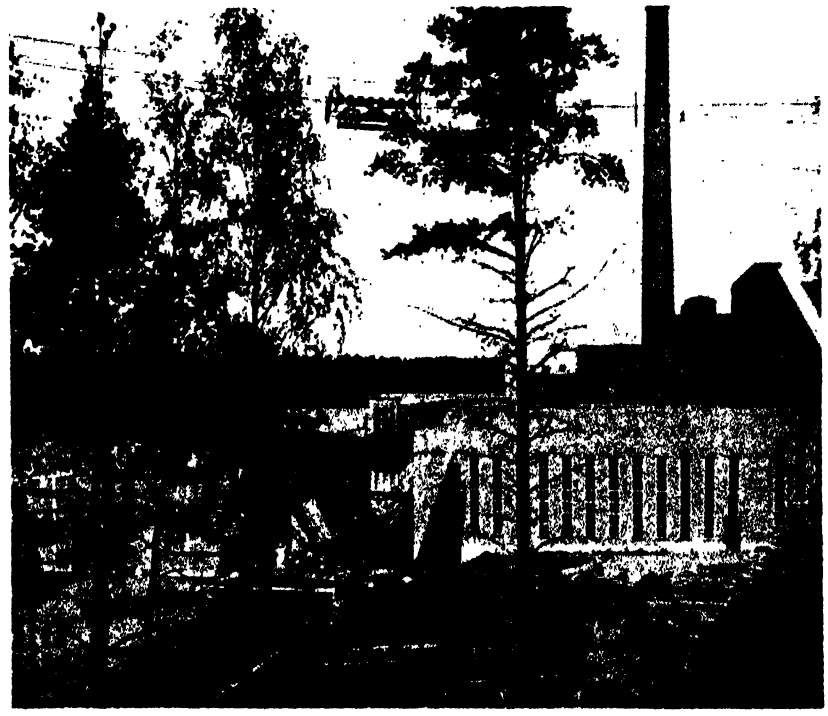
have occurred among workers in garages where gas generators have replaced gasoline motors. A new wood chemistry department building was erected at the Technical University of Helsingfors. Ky 5 is a phenol preservative against bluing of wood. Auto-kollag, a colloidal graphite, is employed for keeping polished the surface of dryers in making wrapping papers. At a pressure of 50 kg./sq. cm., exerted for 30 seconds, felt pads dehydrate a moist groundwood pulp to a greater extent than does filter paper. The use of sea water for the preparation of sulfate pulp results in high maintenance costs because of greater wear and corrosion on the machines. The "vacuum" method of impregnating chips in sulfite digestion is slightly more expensive than steaming, involves more chemicals, greater heat loss, and lower digester yield; but pulp obtained from an evacuated digest is uniform and firm and has excellent color.

Twelve factories producing fodder ("pine oats") from cellulose have been in operation; the output of these establishments rose from 350 to 700 tons daily. At a sulfite mill the yeast is separated (for fodder) from the wort prior to distilling off the alcohol. The large-scale manufacture of sugar from wood has been undertaken. In wood saccharification experiments sulfur dioxide under high pressure has been used for producing dextrose economically. A procedure has been evolved for making, by a special method of fermentation, a cellulose fodder with a high protein content. The oxidation of *p*-cymene, obtained as a by-product in the sulfite cellulose industry, yields terephthalic acid, and if the latter is heated for several hours at 200° to 250° with glycerol and tall oil an alkyd resin is obtained.

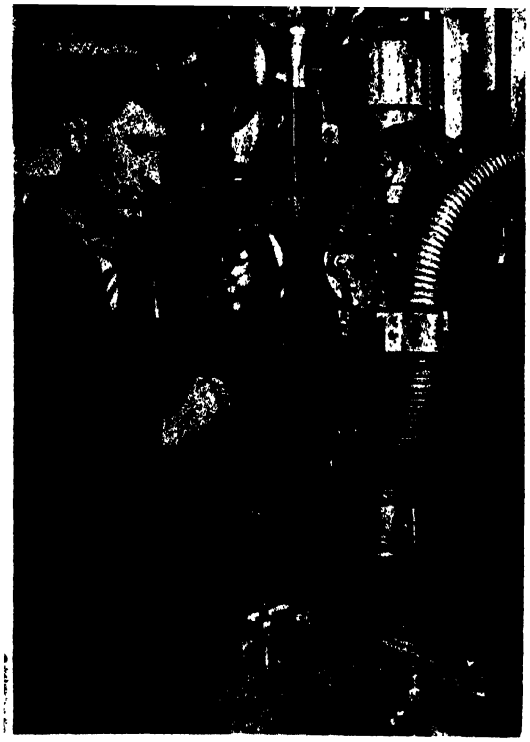
U. S. S. R.



The application of low temperatures in industrial research has been important. A new process of making liquid air was developed; the technique of producing oxygen was improved by the discovery of a method for cooling air without employing high pressures. Quantities of liquid helium were placed at the disposal of scientists. A compound of xenon with phenol was announced and it was said that krypton acts similarly. Research was done on semiconductors, rectifiers, and photoelectric cells. The Academy of Sciences decided to construct a powerful cyclotron at a cost of 1,500,000 rubles. Radioactive substances showed no effect on the oxidation of sulfur dioxide. The explosive properties of nitrogen chloride were studied.

Ceramic Products

Agalmatolites were found to be excellent raw material for the production of ultramarine. Lead cyanamide was investigated as a pigment. Pemzolite is obtained by mixing pumice with cement. Addition of titanium dioxide improved the physicochemical properties of cement; cements containing zinc oxide were resistant to air and water and of considerable mechanical strength. Dehydrated olivine, dunite, peridot, serpentine, bronzite, talc, and synthetic forsterite were used for preparing refractory materials by mixing with calcined magnesite. Pegmatites were utilized for high-voltage porcelain. Glazes based on microcline, plagioclase, and their mixtures possessed high thermal stability and luster. Glasses containing beryllium, lithium, and boron were resistant to crystallization and transparent to x-rays. The efficiency of boron carbide as an abrasive was 40 to 70 per cent that of diamond dust. Attempts to use high-frequency installations for drying various ceramic products were successful.



Coal and Petroleum

Gas is produced in several coal fields by carbonization in the ground. A method has been developed by which all the air and gas passages can be drilled from the ground surface; an oxygen blast has been tried to obtain a more intense rate of combustion. Hydromechanical coal raising—the cutting of coal by a jet of water and the transportation of the coal by the same water along gutters or pipes to the mine yard—was applied. Experiments were made with a fuelless locomotive, charged with steam from a stationary boiler. The absorption of sulfur dioxide from smoke by means of magnesia was held practical for large power stations near contact sulfuric acid plants. The use of lignite for running gas-producer automobiles was demonstrated to be feasible; wood- and peat-fueled taxicabs and trucks were tried. Small amounts of alkali are added to the flushing fluid in drilling for petroleum to lower the hardness of rocks.

Gum formation in cracked gasolines was largely inhibited by 0.065 per cent beech tar or 0.01 per cent phenyl- or tolyl-*p*-aminophenol. In deasphalting distillates, it was found advantageous to use as solvents the propane and propylene fractions of cracked gases. Sulfonaphthenic acids were reported efficient emulsifiers for mineral oils in water. Transformer oils containing coumarone resin were shown to be more stable.

Metals

The Ural-Kuznetsk field, which now accounts for 30 per cent of the country's coal and iron production, may be developed further. In ferrous metallurgy much attention has been given to slag control, increasing open-hearth output, and effect of mold thickness. Research was also conducted on the treatment of air blast to ensure low hydrogen content of basic Bessemer steel. The causes for sticking of thin steel sheets were studied; the chief cause of crack formation in the coils of steel springs was found to be crazing of the steel surface. Steel containing chromium, molybdenum, vanadium, silicon, and manganese was developed as a substitute for high-tungsten tool steels. Cathodic deposition of iron-chromium-nickel alloy was accomplished. The aluminum alloy AN-2.5 containing 2.5 per cent nickel gave the best results as a substitute for high-tin babbitt in bearings. The most highly corrosion-resisting alloys of zinc-magnesium were in the region from the point of chemical combination to pure zinc. Copper-zirconium alloys have been used for electric equipment exposed simultaneously to high temperatures and severe usage.

Synthetic Resins

The Plastmass Institute of Leningrad investigated the effects of temperature and relative quantity of catalyst on the conversion of acetic acid into vinyl acetate. The resins obtained from phenols extracted from various peat tars were suggested for the preparation of Textolite and Cartolite. Addition of cannel coal up to 30 per cent to phenol-formaldehyde molding powder increased the mechanical properties, dielectric strength, heat endurance, and water resistance of the plastic. Lignofol is a plywood impregnated with a phenolic. The plastic Faolite was recommended as a substitute for lead. Corrosion-resistant compositions called Asbovinyl were prepared from asbestos and divinylacetylene lacquer, a by-product in the manufacture of Sovprene. Interpolymerization of methyl methacrylate with allyl methacrylate was found to yield products characterized by high softening point and resistance to organic solvents. Glycol sorbate gave hard films. Various resins were prepared by condensing at 180° and 190° tetrachlorophthalic and 4-monochlorophthalic anhydrides with glycerol or ethylene glycol.

Textiles and Rubber

The complete utilization of larch was outlined. Phthalic esters of cellulose were studied. Cellulose was best acetylated with acetic anhydride in the presence of pyridine. Sulfite liquor as an addition agent enabled higher current density without causing nodules and trees in cathode copper. Uses were sought for cymol. Virotsvet is a paper for color photographs. Verdol paper is employed for applying designs to textile fabrics. Cast iron in drums of textile machines was replaced by gypsum. No alteration was found in the hemicellulose content of flax before and after retting; the retting process came to an end when about half of the pectin substances had been decomposed. A new fabric consists of 50 per cent wool and 50 per cent fiber made from lupine seed albumin. Several experiment stations have been at work endeavoring to improve the silk industry. Novochrome Black N and Novochrome Fast Orange SRC showed a protective effect on the strength of silk. Dehydrated castor oil gave a soap of the same quality as that prepared from natural unsaturated oils. Interpolymerization of cottonseed oil with residues from manufacture of synthetic rubber afforded drying oils equal or superior to linseed oil. The adhesiveness of fractions of synthetic rubber became more pronounced with increase in molecular weight. Black synthetic rubber was reclaimed and its qualities improved. Aminobenzene is a vulcanizing agent of exceptional strength. The physical and mechanical properties of rubber vulcanized by the aid of high-frequency currents were superior to those of rubber obtained by the usual vulcanization procedure. Good results were had in using an aqueous suspension of synthetic rubber in cementing fabrics employed as leather substitutes. Chlorinated Sovprene was said to be better than other chlorinated rubbers for coatings. By treating half-velvet fabrics with a preparation having a chloroprene-latex base, falling out of the nap was prevented. Soviet authorities have been contemplating the expansion of the cultivation of the rubber-bearing plant known as kok-saghyz, whose more active development is obtained by periodic nitrogen fertilization with local application of superphosphate.

Food and Marine Products

Passing a direct current through the soil helped the formation of water-resistant aggregates. The employment of sodium chloride as a fertilizer for sugar beets was beneficial on carbonate-containing soils. The application of boron increased enormously the seed yield of various lucernes. Chloropicrin added to the soil used for tobacco seedlings was efficient as a disinfectant. Tomatoes treated with ethylene (1:5000) ripened 5 to 10 days earlier than unharvested tomatoes; storage in peat also effected earlier ripening and decreased spoilage. About 23,500 tons of tea were produced in 1941, mainly in Georgia. In order to make tea more valuable for expeditions it was vitaminized by the addition of powdered hipberry concentrate. In extracting carotene from pine needles by a new method, chlorophyll and vitamins C, E, and K are obtainable as by-products. The soft outer shell of unripe walnuts contains a large amount of vitamin C. Nineteen varieties of essential oil plants have been cultivated; a special research institute has helped in the development of oil plant culture. A system for continuous fermentation of molasses, developed by arranging a battery of fermenters for wort to move in two streams, increased distillery output 30 per cent. A 99 to 100 per cent conversion of glucose to *d*-sorbitol was accomplished by hydrogenation at a pressure of 60 to 80 atmospheres. At a meat-packing plant in Moscow the sausage department has been handling 130 tons a day, and another part of the factory turns out 1,000,000 meat balls. Ninety-two thousand tons of fish were distributed in 1941. Seaweeds gathered in the far eastern waters of the Soviet Union have been exploited as raw materials for chemicals. *Laminaria* is regarded as suitable for the production of mannitol, potassium salts, and iodine; *Anfeltia plicata* and *Furcellaria* are thought best for the manufacture of agar. Odessa agar (from *Phyllophora nervosa*) and White Sea agar (from *Anfeltia plicata*) differ in certain respects from ordinary agar and it has been suggested they be termed "agaroids". Ammonium alginate has served as the starting material in research on the production of plastic masses; films of copper, calcium, zinc, aluminum, iron, and lead alginates are very brittle.

Palestine

The mandate government established a War Supply Board to function as an intermediary between Palestine industry and the Middle East Command. Industrial production has reached a value around £10,000,000 annually. Outstanding features have been the advances in the little metal and machine industries. Further expansion of potash, bromine, and other chemicals production occurred at the Dead Sea plant of Palestine Potash, Ltd.

Fourteen N^4-acyl-sulfanilamides and 15 acyl derivatives of 4-(benzene-azo)-1-naphthylamine were described. With support of the University of Jerusalem, young chemists have banded together on a cooperative basis to prepare pure chemicals for scientific institutions and hospitals. For a long time Tel-Aviv has had a laboratory supported by the local chemical society that practices analytical and consulting work and has discovered a means for making glass splinterproof.

Palestinian vegetables as a rule show a higher water content and a lower nutrition coefficient than the same kind of vegetables in other quarters; almost all fruits and vegetables of Palestine have a higher calcium content and also a lower phosphorus content, with a consequent higher Ca:P ratio, than similar foods in Europe and America. The production of hardened vegetable oils has been introduced. The mandate government established Citrus Control and Citrus Marketing Boards to ease difficulties of the industry. The stoppage of exports of citrus fruits by war conditions has led to consideration of expanding the manufacture of by-products. Neither the oil content of oranges and grapefruit nor the quality of the factory oil appears to depend definitely on the season or the rainfall. Physiological tests have revealed that diphenyl is harmless in quantities severalfold those to which workers are exposed in the manufacture and employment of impregnated paper in the citrus industry. Orange peel is used in bread.

Union of South Africa

The government voted £5,000,000 to be used for the promotion of new industries and expansion of existing manufactures, particularly coke and steel. The chemical industry is associated principally with mining and agriculture: the gold mines of the Johannesburg area require about 200 tons of explosives daily, 80,000,000 detonators annually, and large quantities of chemicals employed in extracting and refining processes, especially cyanide; agriculture needs around 300,000 tons of superphosphates a year. The Minerals Research Laboratory is conduct-

ing experiments on making chromates, dichromates, and chromic acid from domestic chrome ore, of which about 325,000 tons are produced annually in Southern Rhodesia.

An investigation was performed to determine whether the amount of water incorporated in coal-oil pastes could be reduced. Yields of 60 per cent of gasoline are obtained from torbanite oil at the Satmar refinery by combining topping and cracking with recovery from wet cracked gas. The government has been studying the use of charcoal as a motor fuel. Corundum deposits in Southern Rhodesia are under development. Natural earth pigments are being increasingly produced. Wonderstone, a pyrophyllite, has been found useful in certain refractories and for some building purposes. Cinnabar is being mined. A mixture of 4 per cent zinc sulfate and 0.6 per cent triolith is a recommended timber preservative.

Steps have been taken to manufacture synthetic glycerol. A company has been experimenting successfully with the fermentation of molasses by a special yeast under alkaline conditions. The dehydration of citrus fruit is under study and Transvaal farmers are considering the commercial production of avocado oil. At the University of Cape Town research is in progress on the therapeutic properties of fish-liver oils; the possibility of extracting oil from the liver of the gray shark is being accorded main attention. It has been concluded that cystine increases the milk production of rats.

India

Investigations recommended for adoption by the Board of Scientific and Industrial Research include manufacture of electro-acoustic and high-frequency apparatus, x-ray transformers, refrigerating machinery, photographic plates and photosensitizing dyestuffs, industrial preparation of essential oils and of ionone from lemon grass, production of thyroxin, extraction of sulfur from pyrite, and manufacture of optical glass. Projects completed by the board related to the manufacture of laminated paper products, resin-impregnated wood, dry cells, glass substitutes, and stoving enamel. Steps were taken to assist nascent and undeveloped industries through the Test House at Alipore. The Industrial Research Utilization Committee approved that a journal entitled *Indian Industry* be published.

Minerals and Chemicals

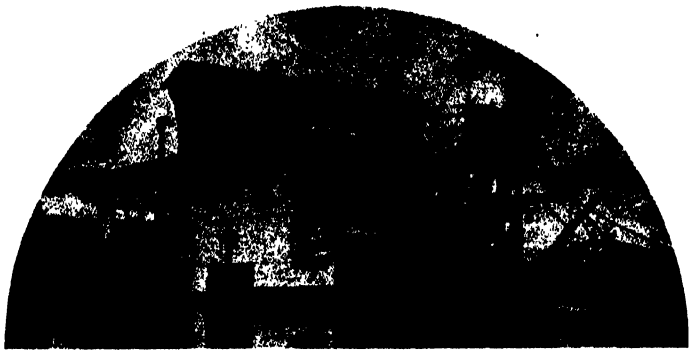
The Geological Survey has been investigating several deposits of sulfur and pyrite; research has been undertaken to ascertain the best methods of recovering sulfur from smelter and coke-oven gases and from the treatment of gypsum. Large deposits of sulfur have been discovered in Baluchistan. The possibility of developing a mica grinding industry is being studied. Refractory minerals such as sillimanite and kyanite have been claiming attention; Mysore abounds in raw materials for the manufacture of porcelain, and as several good deposits of clays are available the production of stoneware is being considered Electric tunnel kilns are used successfully in firing porcelain, A bulletin appeared on the purification of glass-making sands. A number of firms began the manufacture of China glass; other new lines include beads, imitation pearls, ornamental glass plates, lampware, vials, and tableware. Cadmium plating of iron was studied broadly. Silver and gold sols were found to have beneficial effects on the electrodeposition of nickel on iron; Prussian blue hydrosol came next in order of efficiency. The manufacture of surgical instruments from Indian steel is under investigation. Fifty-nine chemical manufacturing concerns are operating. The output of soda ash amounts to 12,000 tons a year. A heavy chemicals industry has been started at Mithapur; a sulfuric acid factory has been established at Petlad. The Hyderabad Government is considering factories for the manufacture of nitrates and ammonium sulfate and pilot plants for high-temperature carbonization and hydrogenation of coal. Mysore is the chief producing center of chrome ore and the manufacture of sodium dichromate is likely to be commenced soon. Matches made in India are on the English market. The pharmaceutical industry is progressing in its efforts to bring out substitutes for drugs formerly imported. Acetic acid, adrenaline tartrate, amyl nitrite, calcium lactate, chloroform, cresol and phenol, emetine hydrochloride, and formaldehyde are now being manufactured. Sodium citrate is being produced in the Punjab from lemons grown locally. The Imperial Veterinary Research Institute at Mukteswar is one of the largest establishments of its kind in the world; the production of vaccines and sera is among its activities.

Plant Products

The Imperial Council of Agriculture formed committees to link up research with practical requirements. Work has been carried out on the lining of canals to prevent water seepage and on the production of fuel gas from village rubbish. The triennial program of work, 1940–42, of the Forest Research Institute gives evidence of progress. Tests have been made on various types of lumber suitable for aircraft construction and repair. Because of the shortage of cork the institute has carried out experiments with wooden stoppers, suitably slotted to provide the necessary degree of resiliency; the timber used, *Cryptomeria japonica*, has had no previous commercial outlet. Difficulties encountered in the manufacture of charcoal from coconut shells have been largely surmounted. The consumption of plywood has been on the increase; the bulk of the plywood production of two factories in Assam is used in the manufacture of tea chests. Touri offers a very cheap and abundant source of tannin. To improve the quality of leathers, the government is making technical assistance available to tanners; there is a leather trade institute in Madras and a tanning school in Bombay. Markets are being sought for safflower seed oil, now used largely for cooking. The annual production of sandalwood oil at Bombay's only factory is estimated at 100,000 pounds. The spike disease of sandal, of virus origin, has been studied; the control of the insect culprit is probable in the near future. Among activities of the Indian Lac Research Institute was the demonstration of improved methods of lac cultivation and of simplified procedures for pest control. The suggestion has been made that India might export bleached shellac to the United States, a problem that could be solved by suitable refrigeration during transportation. Resins have been prepared with shellac-formaldehyde and melamine which are transparent and more thermohardening than other similar products; they yield promising baking varnishes. Cashew nutshell oil compounded with shellac affords resins giving water-resistant and elastic films. The introduction into industry of molding powders evolved in the institute has been under discussion. The utilization of casein in plastics and the production of phenolic and urea resins are to be studied. A technique has been developed for manufacturing varnishes and paints from bhilawan nuts. The Indian Institute of Science completed basic work on the manufacture of pigmented lacquers in powder form and the Department of the Director of Development at Cuttack finished an investigation on lacquers for wood products. The manufacture of white lead paint is being studied. A short time ago the Alipore Test House introduced luminous paints which have been tried in Calcutta. Almost all the commoner Indian vegetable oils can be used satisfactorily for Diesel engine fuel according to the results of a three-year investigation at Alipore. A method of refining castor oil and utilizing it in the manufacture of lubricants is being studied. An extensive research program has been drawn up for finding places for vegetable oils mixed with mineral oils as lubricants. Blown rape oil is being used in axle lubrication. The Industrial Research Bureau at New Delhi has been investigating the possibilities of utilizing vegetable oils as lubricants in internal combustion engines.

Paper is included among the industries showing activity under war conditions,

but newsprint is not produced. The facilities offered to cotton mills by the Indian Central Cotton Committee's Technological Laboratory in Bombay have been increasingly appreciated. In this establishment work was commenced on such uses of cotton as substitute for hessian cloth, cotton belting, artificial leather, cloth for road construction, and bags for sugar, flour, and cereals. A container made of canvas and a plastic, designed specifically for dropping fuel and water supplies from airplanes, was given experimental attention. Jute hessians are being employed to meet the shortage of canvas and the use of jute cloth hammocks in air-raid shelters has attracted attention. Improvements have been made in the techniques of spinning yarn from jute fiber. As experiments have proved that sugar bags made of rosella cloth are more suitable than those of jute from the point of view of moisture absorption, efforts are being made to reduce the hygroscopicity of the latter. Experiments have also been undertaken to find out if seaming twine can be made from jute to replace Italian hemp. A program of investigation on blended yarns of jute and flax has been laid down. The volume swelling of dry jute fibers calculated from the specific gravity is 45 per cent. The possibility of using sisal as a substitute for Manila cordage and rope is under study. Owing to its lack of smoothness the sisal bag is less easily repairable than the jute bag. The development of wool production and the improvement of sheep are being reviewed. The establishment of a wool research station has been recommended. The war has revived India's vegetable dye industry. According to the Forest Research Institute, kamala powder, if properly prepared, should regain favor with foreign importers as an orange dye for silk and wool; work on derivatives from kamala flowers for use as edible coloring materials was completed at Cawnpore. The University of Mysore is trying to employ myrobalans for preparing dyes. Experiments have been successfully made in Madras with several natural dye-yielding products of indigenous growth. Cyanine dyes of the pyridine series have been studied. The cowpea can be used for textile sizing and as a thickening material in calico printing. Formulas for antigasproofing fabrics were recommended by the Test House at Alipore.



Foods

More than 60 diet surveys have been carried out in various parts of India and facts regarding the defects of Indian diets and improvements which are desirable have emerged from these studies. Efforts are being made to evolve varieties of rice suited to conditions of growth in the country. Information on papaya genetics has been gathered and seeds representing six different selections have been distributed for trial in Bihar and Madras. Practically all important fruits and vegetables grown in India have been studied under cold storage schemes in Bombay and the Punjab. A monograph on the poisonous plants of India was published. Two stations for research on cinchona have been under consideration. Among new schemes are investigations into diseases of rice, canning and preservation of fruits, preparation of wines, sheep breeding, and diseases of poultry. At the Indian Institute of Science in Bangalore it has been found that there are possibilities in growing plants in activated sludge tanks. A special process has been invented for drying potatoes, and experiments are in progress on the dehydration of other vegetables. The water chestnut has been found to be a good source of starch. It is generally believed that khandsari sugar and gur are much sweeter than pure cane sugar, owing to the fact that there are present in the crude sugar and gur aromatic flavors and organic acids which enhance the flavor. Much attention has been given to the improvement of methods of sugar-cane cultivation. Molasses has been tried in cattle feeds; road-surfacing compositions containing molasses have proved satisfactory; experiments on the fermentation of molasses to butyl alcohol, acetone, and acetic acid, and on the production of yeast have shown the practical possibility of development into paying manufactures. A method of disposing of sugar factory effluents has been evolved in the Imperial Institute of Sugar Technology at Cawnpore. The director of that institution also controls the Sugar Research and Testing Station at Bilari, the Bureau of Sugar Standards, and an experimental sugar factory. The hygroscopicity of sugars is an inverse function of the purity; pure sucrose can be stored safely at a relative humidity of 65 per cent between 30° and 35°. The Imperial Council of Agricultural Research began studies in candy manufacture at Cawnpore and Ravalgaon. The production of glucose is being investigated. The loss of vitamin A in ghee occurs as a result of the changes taking place in storage or exposure to heat and air; treatment of such ghee with hydrogen under pressure has been found to regenerate the vitamin. Studies have been carried out on the effect of the methods of preparation and feeding of oil cakes to dairy cattle on the physical and chemical constants of ghee. The cashew apple was shown to be a rich source of vitamin C. Vitamin C protects enzymes against inactivation by ultraviolet light. Oxalic acid inhibits markedly the oxidation of this vitamin. Kokum butter from the red mango tree was proposed as a substitute for cacao butter. The manufacture of margarine for British troops is under study. The dried fish and prawn industries are large, especially in Bengal, but the methods followed leave much to be desired. Increasing interest

DOROTHY HOSMER

The concentration of tin ore in Malaya. A pump elevates the tin-bearing gravel to a gallery of wooden planks where a continuous flow of water carries off the lighter elements, leaving the tin ore. Once a month the pump is turned off and the water allowed to evaporate so that the tin ore may be collected and packed in sacks. Coolies see to it that the gravel is not allowed to accumulate in large bulk and stop up the stream.

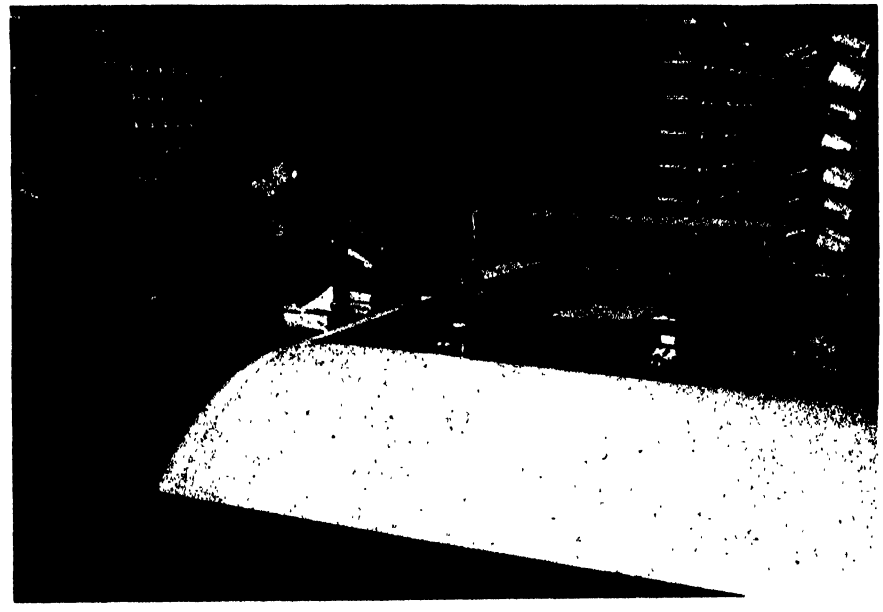
partment of Science has investigated the production of solar salt and soybeans and has undertaken research on indigenous drugs.



Netherlands Indies

New uses have been sought for molasses. The solubility of sucrose in various organic solvents has been investigated. The flavoring powder Ve-tsin consists principally of sodium glutamate. The manufacture of soap from fish oil has been studied. Work has been done on the production of vitamin A from fish liver oils and on the production of vitamin D from cholesterol. Investigations have been made on the use of fish oil in the manufacture of paints and varnishes.

is being taken in fish oil extraction, particularly in Bombay. At the Science Institute in Bangalore studies have been made on the preparation of liquid calciferols for use in artificial cod liver oil for the Indian Army. Work on the vitamin content of fish oils in the Nutrition Research Laboratories at Coonoor has played an important part in recent developments. Investigations have been completed on lemon grass oil and on using mahua oil for making soaps. The extraction of saponin from soap nut has been studied.

Thailand

Thailand has no rubber manufacturing industry, but rubber plantations have been improved. A factory to manufacture explosives was erected in 1941 and other chemical projects have been in the planning stage; the demand for chemicals has been growing as the trend toward industrialization has continued. The De-

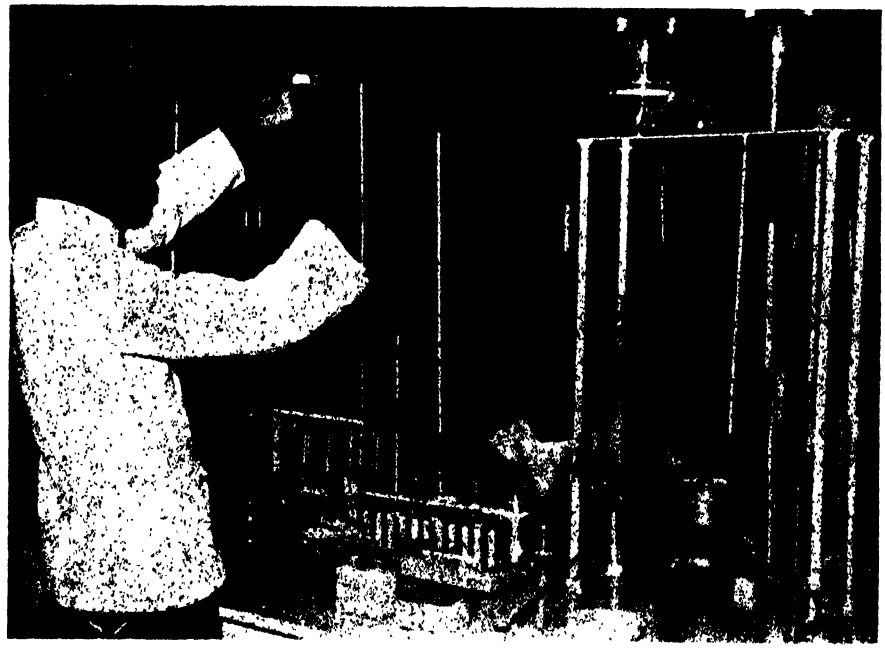
facture of batik is estimated to require annually from 100,000,000 to 150,000,000 yards of cloth, principally cambrics. Ergansoga koening RN, an orange-brown dye used in the batik industry, was synthesized. There are two plywood factories. Government aid is being extended to the leather industry; the output of colored leathers has been improved and increased. The fat acids of H-acid are responsible for its coalescent effect on β-latex. A report was issued on the utility of latex as a protection against glass splinters during bombing raids. Mealorub, a partially vulcanized rubber in granular form, is possibly of importance upon blending with bitumens. The Netherlands Indies Crisis Cinchona Ordinance, designed to foster experimental work on cinchona, was extended for three years.

Australia



The rapidly increasing use of diamonds in mining and manufacturing has directed attention to the possibility of utilizing Australian stones. The Commonwealth Council for Scientific and Industrial Research has been making a thorough exploration of domestic potash resources; in Western Australia preparations have been under way to produce potash from alunite deposits in the bed of Lake Campion. It was decided to manufacture aluminum from domestic bauxite. An Aeronautical Research Committee was set up; it has been proposed to transfer to Australia a considerable part of the aircraft manufacturing of the United Kingdom. Mercury deposits are being developed.

Wood Products and Textiles

The addition of gasoline is regarded as a practicable method of obtaining increased power from an engine running on producer gas. Progress has been made in the introduction of producer gas, particularly with farm tractors. Hardwood charcoals have been examined as to suitability for gas producers. Phellandrene from eucalyptus is effective as an antiknock; the addition of eucalyptus oil to motor fuel increases power and mileage. Eucalypsum, made from eucalyptus leaves, is a preparation for removing scale from ammonia condensers. The Council for Scientific and Industrial Research published the nomenclature of Australian timbers. The first newsprint mill came into production; an output of 27,700 tons was expected in 1941. Softwoods from South Australian forests are being used to manufacture wood pulp for munitions. A fourfold increase in the production of flax was announced by the government. In the scutching of flax straw, for dew-retted and water-retted straw the best moisture content range is 9 to 13 per cent, and for unretted straw it should be between 13 and 15 per cent. In the treatment of wool by alkali, the most promising reagents are solutions of potassium or sodium hydroxide in ethyl alcohol which contains a small percentage of water; results of wearing and washing tests on garments made of wool so processed have induced continuation of investigation; at present a stocking manufacturer is employing the procedure and a woolen firm uses it for the treatment of wool in tops form. Research has been given to textile mildews.

Foods

Agricultural features of the potato industry were published. At the fruit products laboratory at Homebush studies have been carried out on the production of fruit juices and on general food canning problems. Work has been continued on the effects of the application to citrus fruits of thin waxy and other coatings. Studies are being made of materials which may be suitable for watertight containers for packaging boneless cuts of frozen beef. Meat powder might help solve Britain's meat storage and transport problem. An investigation indicated little or no future for ozone in the ripening of meat. Results appeared in the control of ectoparasites of sheep. Extensive research has been conducted on the preservation of fish and on the cold storage of smoked fish and eggs. The Council for Scientific and Industrial Re-

NETHERLANDS INFORMATION BUREAU

Natives carry on control tests in the sugar factory Petaroekan in Java

search has been investigating factors in the marketing of fresh fish in Eastern Australia; the conclusion reached in other countries that the flora of spoilage is similar to that of the slime and gut has been confirmed. Oysters could be grown more cheaply, to a better standard, and in greater quantities than they are at present. The southern bluefin tuna would form the basis for any large-scale tuna-processing industry. Yellowtail livers yield about 10 per cent by weight of an oil that is 40 times richer in vitamin A and 110 times higher in vitamin D than cod liver oil; the possibilities of other fish are under research. Agar-agar production is being studied.

The F. D. McMaster Animal Health Research Laboratory at the University of Sydney

New Zealand

Plans have been completed for the production of silico-superphosphate containing serpentine; the initial annual output will be 100,000 tons. Additions of coal have been used effectively for keeping the grinding bodies uncoated in the preparation of the raw meal for cement manufacture by the dry process. By an electromagnetic method a 90 to 95 per cent glauconite was produced from greensand; considerable potash was obtained from the glauconite by roasting and subsequent treatment with 1 per cent hydrochloric acid. Study is being given to the processing of bentonite. The iron ore of the Collingwood district forms deposits of potential economic importance south of Parapara Inlet; low-grade chrome ore occurs at several places and especially on the east coast of d'Urville Island; the production of scheelite has been increasing.

The United Kingdom will take 160,000 tons of cheese in the 1941–42 season. Dried milk production is also being stimulated. The government will devote 25,000 acres to fiber flax. In atmosphere exposure experiments, fine fibers were attacked more rapidly than coarse fibers, while wools from different breeds were unlike only in the initial amount of attack. The activation of charcoals was studied. The chemical treatment of dwellings infected with termites, without cost to the owners, has been undertaken by the Department of Scientific and Industrial Research.

The Philippines

Distillation curves were reported for Alkohl motor fuel, a mixture of ethyl alcohol, kerosene, castor oil, and acetone. Two plants were found to yield oils resembling bergamot and jasmine. The chemistry of pili nuts was reviewed. A superior grade of oil is obtained by pressing fresh undried coconut meats and breaking the emulsion by biochemical means. The expeller process for coconut-oil extraction is not economical; the roller method is better than the cage hydraulic press for obtaining the oil emulsions from fresh meats. Since 1928 the Philippine Sugar Association has been conducting entomological studies and also research on the breeding and testing of new varieties of sugar cane. Attempts to cottonize abaca have been unsuccessful. Efforts have been made to stimulate interest in the production of rubber.

China

The Ministry of Economic Affairs has been planning for mineral development and the National Geological Survey has been making studies of mineral deposits. China produces about 65 per cent of the world's tungsten. A process employs tung oil instead of water in gold recovery. China Vegetable Oil Corp. has been investigating the preparation of tannic and gallic acids at points of origin. Bamboo pulp has been made by the use of a hydrotropic solvent. Small quantities of protein were produced from soybean at Shanghai and Tientsin; some phenol, casein, and cellulose plastics were manufactured at Shanghai, where also a process was in use for removing color from silk in old stockings. 2-Methyl-1-hydroxy-4-aminonaphthalene hydrochloride, a water-soluble form of vitamin K, has been synthesized from α-naphthol. Teas on analysis show a high fluorine content. Work is in progress on fertilizers. The control of rice borers and other grain insects constitutes the foremost studies at the National Agricultural Research Bureau.

Knitting department in a Japanese textile plant

Japan

Coal in tests as a substitute for gasoline in taxis reduced the fuel cost 50 per cent. It has been proposed to vaporize alcohol and gasoline in separate carburetors and to inject the vapors, in proper proportions to each other and air, separately into combustion chambers; acetylene gas and gasoline could be used similarly. Coalite

can be employed as a motor fuel. Experiments have been made on the low-temperature carbonization of coal mixed with acid clay, Kanuma earth, and activated carbon. By heating cokes containing 17 per cent ash at 850° to 900° in a stream of chlorine the ash content was reduced to 7 per cent. After 12 years of investigation continuous operation of the liquid-phase hydrogenation of coal paste was accomplished in 1939. Basic production research on the process is being conducted at the Kyoto Imperial University and the Imperial Fuel Research Institute. At Kyoto there has been developed a catalyst composed chiefly of iron. More research is needed to evolve a catalyst capable of maintaining yield against poisons in the effluent gases. Coal liquefaction by the Fischer-Tropsch process and recovery of by-products from the distillation of coal tar will be the principal lines of the new Mitsui Chemical Industrial Co. A plan called for a synthetic fuel production of 2,000,000 tons in Japan and Manchukuo in 1941, but progress has been impeded by war. The thermal polymerization of methane has been studied.

Metals

Several new iron and steel plants were constructed in Chosen. Tungsten deposits were exploited at Yotoku and in the Diamond Mountains; a nickel deposit was discovered. Japan's nickel consumption in peacetime is 3,500 tons a year. Addition of aluminum, chromium, or manganese has been shown to increase the resistance of iron toward sulfur; vanadium or molybdenum to decrease it. Vanadium steel was made from low-phosphorus, vanadium-bearing ores by using a flux of soda ash. The aluminum industry is not predicted to reach self-sufficiency for at least three years. Aluminum is being produced from alunite but costs are high; processes using clay have been proposed but are not commercially successful. The mechanical properties of duralumin have been improved by the addition of cadmium, cobalt, chromium, molybdenum, lead, tungsten, and zinc, but the addition of silver, bismuth, iron, nickel, antimony, tin, and titanium had no effect. The addition of iron to superduralumin causes cracking of sheet during hot-rolling and deteriorates the age-hardening properties. The age-hardening of aluminum-copper and aluminum-magnesium-silicon alloys has been investigated. Strong aluminum alloys ESD and ESDC are in production. The fluidity of pure magnesium decreases on addition of 5 per cent aluminum, but increases on 10 per cent addition. Copper and cobalt deposits were discovered in Chosen. A new copper alloy, HB-5, was developed, containing aluminum, iron, manganese, zinc, and chromium. A study was reported on the effect of lattice strain on the reflectivity of silver. Tantalum has been recommended for ultrashort-wave tubes.

Chemicals

A chemical warfare department was set up. Employment in the chemical industry has increased 18 per cent since 1937. Rich gypsum deposits have been discovered in three places in northern Manchuria. A comprehensive report was issued on Bessi cupriferous pyrite, mined since 1690; the production is around 54,000 tons annually. Following the expansion of pyrite mining there has been increased production of sulfuric acid: there are 45 contact plants employing vanadium catalysts of American types; seven use the Mitsui-Osame catalyst; the Kyoto Imperial University has evolved another catalyst containing vanadium and phosphorus. The following industrial chemicals are in short supply: ammonium carbonate, boric acid, ethyl acetate, nitric acid, potassium dichromate, potassium permanganate, sodium peroxide, sodium sulfide, and tartar emetic. The mechanism of the nitrogenation of calcium carbide has been studied. High-pressure hydrogenation of phenol results in the formation of considerable proportions of methyl cyclopentane where molybdenum catalysts are used. It is expected that acetophenone will be obtained cheaply by condensation of benzene and acetyl chloride; the high-pressure hydrogenation of acetophenone and catalytic dehydration of methylphenylcarbinol have been described. There has been uneasiness over the availability of glycerol. One factory is said to be manufacturing glycerol from waste molasses; glycerol as well as alcohol and acetone are produced in Indo-China. Potato starch was found to glycerolyze easily. Official encouragement has been accorded to the production of tannin.

Plastics

Data relating to 30 synthetic resins were published. Laminated phenolic insulation for use on electric machinery is made by six manufacturers; Standlite synthetic resin bearings have been evaluated in electric motors and rolling mills. The derivative of Urushiol with indene gives a film having durability. Urea resin is used as an electrical insulating material for oil-immersed machinery; research has improved the water-resistance of this plastic. If egg white is hardened at pH 4.8 in formaldehyde and if the hardened material is molded with 10 per cent water, a plastic product of low water absorption and with little deformation can be obtained. The Manchuria Electrochemical Industry Co. is studying the production of synthetic rubber. Para rubber grown in Formosa has been used experimentally; some rubber from Hevea trees has also been secured in Formosa. Rubber of *Ficus retusa* has given promising results.

Textiles

In Formosa it is said a hemp substitute has been prepared from banana skins. Formosa is one of the largest jute-growing regions in the world. A nonmotile bacillus was isolated from the retting vats for jute fiber. About 80,000 hectares of flax were sown in 1941. Increased silk quality results from adequate feeding to worms of properly ripened mulberry leaves during the early stage when food consumption is greatest, followed by feeding of leaves of high-protein content during the later stage when they eat moderately. Japan is still far from self-sufficient in pulp for rayon and staple fiber manufacture. Kalampayan, Tankawang, Rongang, and Binoeang jantan give pulps suitable for rayon production. Cellulose has been made from rice straw, wheat straw, bamboo, bagasse, and Manchukuan reed by triple digestion with nitric acid and caustic soda. Research was done on the acetylation of cellulose with the use of sulfoacetic acid as catalyst. Direct wet-spinning of acetate silk filaments into a coagulating bath of sodium acetate and acetic acid gives best results where the bath contains 10 to 20 per cent of acetic acid and 20 to 30 per cent of sodium acetate. At present the fiber from soybean protein has only 0.8 to 1.0 g./denier of dry strength and 0.3 to 0.4 g./denier of wet strength. Soybean protein dissolved in 49.5 per cent urea solution is reported to be more stable than in caustic soda—a fact that is thought to deserve consideration for manufacturing soybean fiber. Waste from the production of soybean protein fiber has been satisfactorily purified by addition of 25 per cent of activated sewage sludge or 20 per cent of activated sludge from the waste itself. The hydrolysis of nylon has indicated it is composed of adipic acid and hexamethylenediamine. The direct preparation of adipodinitril from adipic acid, for the synthesis of nylon, has been studied by liquid and gaseous phase methods, yielding 50 and 60 per cent, respectively. A fish yarn, a wool substitute now under research, is prepared from whale or shark meat protein hardened with formaldehyde. The strength of casein fibers containing fish protein is decreased with the increase of the latter and increased with the acid or salt concentration of the coagulating bath.

Various Plant Products

The higher grade artificial butter is produced mainly from soybean oil. A factory has been erected in Fusan, Chosen, for the production of rice bran oil for cooking purposes. The effects of various chemicals on the gelation of tung oil have

been described; generally speaking, acidic substances accelerate and basic substances retard this gelation. The gelation time is greatly prolonged if 0.05 per cent of either sulfur or selenium is added. The temperature dependence of the gelation time of oiticica oil is similar to that of tung oil. A 20 per cent increase in perilla seed production was announced. Akatetu oil was described. Research was conducted on the catalytic reduction of camphor and borneol. The contents of carotene and vitamin C in various wild weeds were compared in various seasons. The Japanese Ministry of Agriculture and Forestry claimed success in cultivating a variety of seaweed used for agar-agar with a growing time of 40 days, compared to the usual two-year period.

We have traveled over a long road, and this trip has enabled us to see that in general World War II is giving industrial research new responsibilities, new types of utility. An effort has been made merely to record and not to linger over any of the principal results of this research. Perhaps our log will serve as a kind of tracing of things to come.

In wartime, scientific activities are both complex and spare; everything is surrendered to essentials. Under the largess of government, science steps outside the frame of the laboratory and wrestles with destiny.

Osborne Medal Awarded to R. A. Gortner

R. A. Gortner

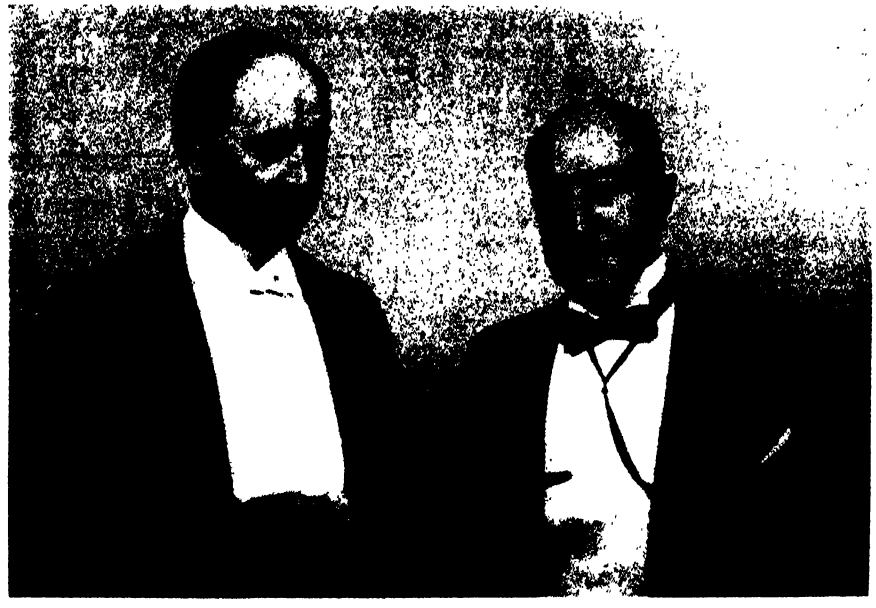
One of the highest honors that can come to a biochemist has been voted to Ross Aiken Gortner, chief in the division of biochemistry, University of Minnesota, who will receive in 1942 the Osborne Medal presented by the American Association of Cereal Chemists to scientists who have rendered distinguished service in conducting research and training students in cereal chemistry. The medal will be presented at the annual meeting of the association next May.

Willard Gibbs Medal to Midgley

Thomas Midgley, Jr.

The Willard Gibbs Medal for 1941 has been awarded to Thomas Midgley, Jr., by the Chicago Section of the American Chemical Society and will be formally presented on May 22, 1942. This is the 31st award of a medal that has come to be recognized as one of the leading honors in American chemistry.

The citation on which Dr. Midgley was selected is:



His attainments are almost too well known to necessitate repetition, but they include the development of the first satisfactory indicating device for determining what takes place in high-speed internal combustion engines (the Midgley indicator). He then worked out the detonation characteristics of various types of fuels and developed a whole series of chemical antiknock agents culminating in the discovery of tetraethyllead. He worked out methods of manufacture of this compound and has been active in solving many problems connected therewith, including the removal of lead deposits which formed with the straight tetraethyllead. He has contributed largely to the knowledge of the chemistry of rubber and the methods of synthesizing rubber. He developed the organic chlorofluorides which have become so important and widely used as nonflammable nontoxic refrigerants. He was associated with the important developments connected with the recovery of bromine from sea water. His discoveries are outstanding, both from the standpoint of pioneering in brand new fields and from the standpoint of the commercial importance of his discoveries.

Jones to Receive Pittsburgh Section Award

Webster N. Jones

Webster N. Jones, director of the College of Engineering, Carnegie Insti-

Ittner Receives Perkin Medal

Martin H. Ittner and Marston T. Bogert during the 1942 Perkin Medal presentation to Dr. Ittner January 9 at a joint meeting of American Section, Society of Chemical Industry, New York Sections of American Chemical Society, American Institute of Chemical Engineers, Electrochemical Society, and Société de Chimie Industrielle.

tute of Technology, will receive the 1941 Award of the Pittsburgh Section of the AMERICAN CHEMICAL SOCIETY at a dinner meeting of the section in the University Club, February 19.

Dr. Jones has been director of the Carnegie Tech Engineering College since 1932. Previously he taught at Purdue, Harvard, Maine, Missouri, and Montana and had a distinguished career as an industrial and research chemist with the B. F. Goodrich Co. During the first World War, Dr. Jones served in the Chemical Warfare Reserve Corps, conducted research on Lewisite, and served as chemical expert on the War Trade Board.

Alexander Silverman, of the University of Pittsburgh, received last year's award. Previous recipients were Edward R. Weidlein, George H. Clapp, and Francis C. Frary.

Hoffmann Scholarship of the Chemists' Club Awarded to Robert T. Olsen

THE Hoffmann Scholarship of The Chemists' Club has been awarded for the school year 1941-42 to Robert T. Olsen, a candidate for the Ph.D. degree in the Department of Chemistry at Massachusetts Institute of Technology. This scholarship, founded by the late William F. Hoffmann, is available in alternate years; the stipend is $800, payable in semiannual installments of $400.

Mr. Olsen did his undergraduate work in the Newark College of Engineering, receiving the B.S. degree in chemical engineering in 1936. In 1937 Columbia University awarded him the M.S. degree in chemical engineering, after which he worked for two years with the Eastman Kodak Co., Rochester, N. Y. In 1939 he entered Massachusetts Institute of Technology as a candidate for the Ph.D. degree in chemistry. He is completing this work under Ernest H. Huntress and will be eligible for this degree in June 1942.

Mr. Olsen chose as his thesis subject for the B.S. degree "Design of a Plant for the Manufacture of Propanol-2", and "Etherification in Hydrotropic Solution" for his M.S. degree. His Ph.D. dissertation involves study in the field of syntheses of coumarones.

Oil Exports from French Indo-China Are Hampered

EXPORTATION of essential oils produced in French Indo-China was handicapped, even before present difficulties, by requirements for export permits. Such permits were difficult to obtain. The country produces mainly such oils as aniseed, cajaput, and citronella, with lesser amounts of Indian vervain, ylang-ylang, and lemon grass, largely by several small native and Chinese growers, who sell to local French refiners and exporters.

Selective Service System Information

THE following memorandum (I-347) as released to local boards (Local Board Release 83) was sent to all state directors by Lewis B. Hershey, Director, Selective Service System, January 12, 1942:

The attention of local boards is again invited to the necessity of seriously considering for deferment students in certain specialized professional fields in which dangerously low levels of manpower are found to exist. This memorandum is in addition to and does not rescind those previously issued which apply to students in other critical fields.

Subsequent to the declaration of war, local selective service agencies have in many instances proceeded to classify registrants without regard to the fact that they are in training or preparation for activities, the maintenance of which is essential to the national health, safety, or interest, and war production. This is particularly true in cases of engineering, chemical, physics, medical, and dental students.

Admittedly there is an overlapping of the military and civilian requirements of a nation at war; however, it must be borne in mind the one is dependent upon the other. It is estimated that the expanding Army will eventually require doctors and dentists in numbers heretofore unknown. They will not be available if those students who show reasonable promise of becoming doctors and dentists are inducted prior to becoming eligible for commissions.

War industries are undergoing a hitherto unknown expansion. Aeronautical, civil, electrical, chemical, mining, metallurgical, mechanical, and radio engineers, together with physicists and chemists are essential to ensure a sufficient flow of materiel for the armed forces, and industry must look to the engineering, chemical, and physics students now in training to meet its present and future requirements.

It is equally important that instructors in these fields be seriously considered for occupational deferment. Shortages of qualified instructors are known to exist. The educational institution employing the instructor should be requested to file DSS Form 42A in all cases where deferment is sought.

In considering student deferment cases, certain local boards are requiring the execution of DSS Form 42A in addition to the affidavit of the college or university contained in Bulletin No. 10 issued by the American Council on Education. DSS Form 42A should not be required where the American Council on Education affidavit has been submitted.

Local boards will be informed when the manpower requirements necessary to the national health, safety, or interest, and war production become static. Until such time, the policy set forth in the Memoranda to All State Directors I-62, I-91, I-99 and I-150 remains in force.

In accordance with, Supplement to Bulletin No. 1 issued by the American Institute of Physics the following telegram was sent from General Hershey's office on January 8, 1942, to all state directors:

Complaints in increasing volume indicate local boards are reopening the cases of registrants deferred for occupational reasons and reclassifying such men in Class One A.

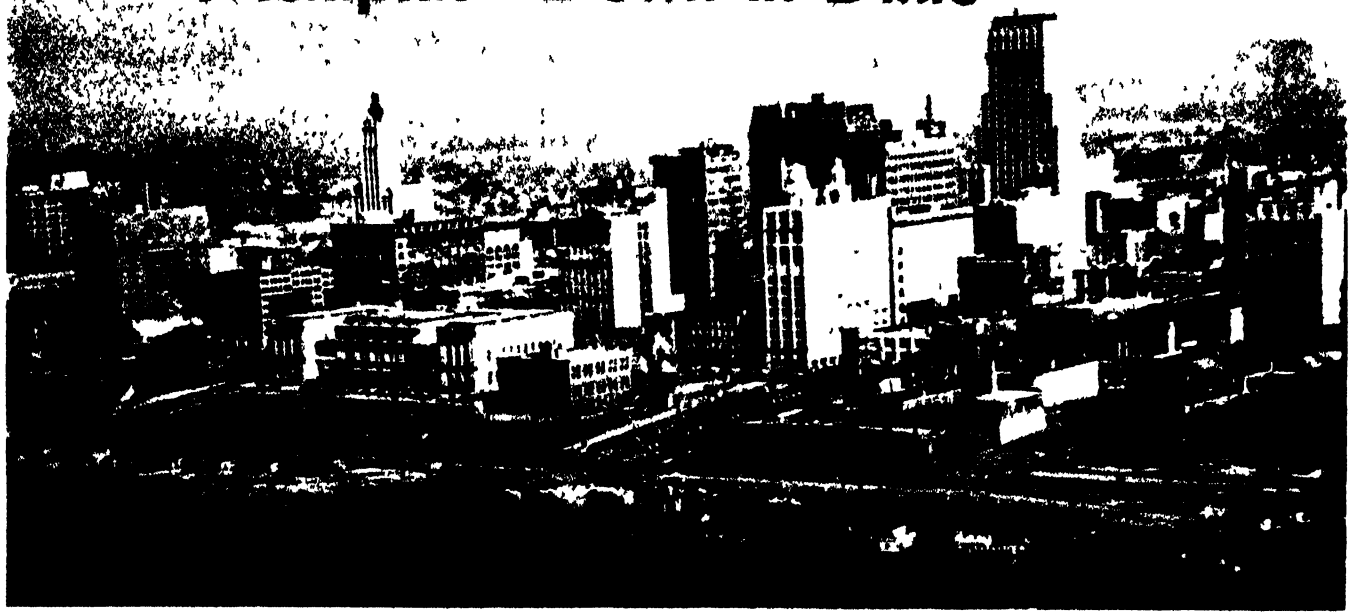
I direct that local boards be immediately informed of the continuing necessity for deferment of men necessary to activities, the maintenance of which is essential to the war production program and the national health, safety, and interest. State directors should avoid calls upon local boards except upon the basis of available Class One A men.

The following telegram was sent to the Texas State Director of Selective Service by General Hershey on January 9, 1942:

This office has been informed that your headquarters has issued instructions to local board that no graduate student can be considered for deferment. No such policy has been adopted by this headquarters and local boards should be informed that graduate students including part-time assistant instructors may be considered for occupational deferment on an individual basis in those fields in which a national or local shortage is known to exist.

William Campbell Fellowships Established

THROUGH the bequest of the late William Campbell, for many years Howe Professor of Metallurgy at Columbia University, two fellowships have been established. They are awarded primarily for graduate study and research in metallurgy.



The stipend of each Campbell Fellowship is fixed at the time of award by recommendation of the Campbell Fellowship Committee and will normally be an amount sufficient to meet the necessary living expenses of the incumbent of the fellowship.

Applications accompanied by certified transcripts of academic records and statements of proposed research projects and fields of graduate studies should be filed with the secretary of the university before March 1. Practical experience in metallurgy or previous graduate study is desirable. Application blanks and announcements will be forwarded to interested persons by the secretary of the university on request. For other information write to Eric R. Jette, School of Mines, Columbia University, New York.

Raymond R. Rogers has been appointed chief chemist at the Welland Chemical Works, Niagara Falls, Ontario.

Lester N. Stanley, after six years with the Central Research Division, Monsanto Chemical Co., Dayton, Ohio, has accepted a position as research chemist with the Esso Research Laboratories, Standard Oil Development Co., Elizabeth, N. J.

Memphis—Down in Dixie

FOUR hundred years ago—it was the spring of 1541—Hernando DeSoto and his Spanish adventurers first glimpsed the great Mississippi River from the bluffs upon which Memphis now stands. The bearded soldier and explorer was the first white man ever to see the Mississippi. He called it the River of the Holy Ghost.

Today, that river, wide and deep, still flows by the towering Chickasaw Bluffs and still laps against the cobblestones of the Memphis levee, where picturesque old steamboats once churned the tawny waters of the Mississippi. Gone are Indian canoes. The golden age of the packet boats has passed. Modern towboats with their oil-powered motors now move with 20th century speed the ever-increasing freight of the Port of Memphis

High up above the river, on the bluffs where DeSoto once stood, stands modern Memphis, host to Meeting One Hundred Three of the AMERICAN CHEMICAL SOCIETY, April 20 to 24, 1942. City of cotton and carnival, sunshine and hospitality, where breezes from the past blow across the bustling present—that's Memphis.

Here you'll find picturesque Front Street, facing the river, where cotton has been king for generations, and beyond its quaint buildings with the wisps of white gold floating out of the windows, rise in the distance the warehouses of the cotton capital of the world. Here is the South's largest manufacturing and distributing center for drugs and chemicals, the world's largest cotton market, hardwood lumber market and mule market, Beale Street "where the blues began" and the equestrian statue of General Forrest, keeping watch over the tomb of the Confederate hero and his wife in beautiful Forrest Park.

While red brick buildings and black-paved streets are component parts of every city, it is not possible to measure a community's greatness by counting the number of new brick or measuring the feet of asphalt. It is the human factors involved that make some cities stand apart from others. Often it is called civic spirit Perhaps that is right, but that intangible something which goes to make a city outstanding can best be illustrated: in Louisville it is the Kentucky Derby, in New Orleans the Mardi Gras, while in Memphis it is the Cotton Carnival.

Begun only as a vague project, the Cotton Carnival was proposed in the early spring of 1931. There has been many a row chopped and many a bale ginned since the movement was launched that now has brought favorable national attention to Memphis for its campaign to recognize cotton. Starting out as a minor parade, the Cotton Carnival has through accretion become the South's largest party with emphasis placed on King Cotton and the multiplying uses for the long white gold from the plantations. This is perhaps the most widely publicized development in Memphis in the past 11 years.

But this year when less vital activities are giving way to the needs of the war effort, the Cotton Carnival has been postponed. Later, when the emergency has passed, the carnival will be resumed, and Memphis and the Mid-South will again link arms to uphold the throne of King Cotton and keep Memphis supreme as the world's largest cotton market.

Along with this commercial predominance has come the desire to maintain it by increasing the applications and distribution of cotton. The Cotton Research Foundation was created in Memphis in 1938 to find new uses for cotton through sponsorship of research projects at the Mellon Institute of Pittsburgh.

Planters, ginners, and those associated with the cotton trade have created the National Cotton Council with headquarters in Memphis. This organization is seeking to promote new uses for cotton and to increase world consumption as well as stabilize its production and marketing.

Monuments to the role of Memphis in the war between the states still stand guard along the waterfront. In DeSoto Park stands the great Indian mound which was the site of the fortress of Chisca, chief of the tribe inhabiting this region when first visited by the white man The Chisca mound was utilized in 1863 as an artillery redoubt and magazine fortress, Fort Pickering, and the top of the mound was excavated for that purpose Up above the center of the city, the forces of the river have deposited an island over the site of a gunboat battle during the war. There, under the guns of the defending battery in what is now Confederate Park, the Federal forces were victorious, and later General William T. Sherman took command of the city. In those days the Wolf River, a stream meandering north of Memphis, emptied into the Mississippi above the city. But in the years that followed, the silting deposits of the Mississippi formed an island in front of the mouth of the Wolf and extended it about three miles down stream to the center of the city.

A city that heard the tramp of Federal troops in 1862 is now proud to be the

headquarters of the Second Army of the United States, proud that Lieutenant General Ben Lear selected this central location to command troops stationed in Arkansas, Tennessee, Alabama, Kentucky, Illinois, Indiana, Missouri, Kansas, Michigan, Wisconsin, and Wyoming.

The position of Memphis at the crossroads of the South is amply proved by the six air routes into and out of the city. New Orleans, Chicago, Dallas, Houston, Washington, and Miami are only a few hours away. A 502-acre airport with mile-long paved runways is increasingly important in a civilian and military transportation system. Ten trunkline railways link Memphis with the Southeast, Southwest, and the industrial cities to the north and east. Eight national highways with a free bridge over the Mississippi River handle an increasing volume of private and commercial motor traffic.

Memphis is nationally recognized as having the greatest fire prevention organization in the country. In 1938 and again in 1939 Memphis was given the grand award among all cities in the United States for fire prevention. The Chamber of Commerce of the United States saluted Memphis as the only major city ever to have won this honor in two consecutive years.

The first southern city to receive the National Safety Council's highest honor was Memphis. The award was bestowed in 1938 for the previous year's traffic record and for leadership in motor vehicle inspection. Memphis was the first city to inaugurate a municipal inspection station for trucks and automobiles with tests made three times a year to determine and correct mechanical faults. At the present time Memphis leads the Nation in traffic fatality reduction. This record is due largely to the aggressive attitude toward traffic regulation including speed limit and horn blowing. The Anti-Noise Ordinance has made Memphis one of the quietest cities in the country.

Memphis has gone far in the matter of municipal ownership of its public utilities. For years the city has operated the world's largest artesian water systems, but only recently it purchased the city-wide electrical distribution system and facilities for handling natural gas from Louisiana. When the Tennessee Valley Authority was launched and power moved out over transmission lines from Wilson Dam on the Tennessee River, Memphis voted the necessary funds for the purchase of its utilities. Today, the City of Memphis supplies electricity, gas, and water to approximately 60,000 families.

Resulting low rates are bringing about increased consumption of kilowatt hours both in the home and in the factories, and new industries are turning an appreciative eye upon particularly attractive rate structures. The city's far-reaching step toward low power rates is casting a lengthening shadow along the highway that Memphis plans to travel toward becoming an increasingly important southern industrial center.

Memphis has grown to be the world's largest nonproducing steel center, with eastern steel companies establishing warehouses there and with movement of steel down the Ohio and Mississippi Rivers for redistribution by rail to the South, Southeast, and particularly to the oil fields of the Southwest.

Because of its location on the Mississippi River, Memphis has naturally benefited. In recent years there has been a general revival of activities in the Memphis harbor with approximately $122,000,000 worth of freight moving annually through this port. The river-rail terminal has been enlarged. A huge municipal grain elevator has been built with river and rail-loading equipment. This makes possible the movement of grain down the Missouri and Mississippi Rivers and the redistribution by rail from this point.

Not so picturesque perhaps as the Robert E. Lee or the Kate Adams, the modern twin-screw, oil-burning towboat handles far more freight tonnage in one trip from Memphis to New Orleans than the ornate steamers of the seventies. An old-time packet boat had a capacity of 1,800 tons. But a modern barge will carry more than that, and it is customary to have six to eight barges in one tow.

Since the beginning of cities, strategic location and transportation have been governing factors in expansion and development. Therefore, it is no surprise to Memphians when informed manufacturers look with favor on this city as a logical industrial and distribution point. The increasing trend of industry has been toward the South in the past six to eight years and a large number of concerns have begun operations in Memphis.

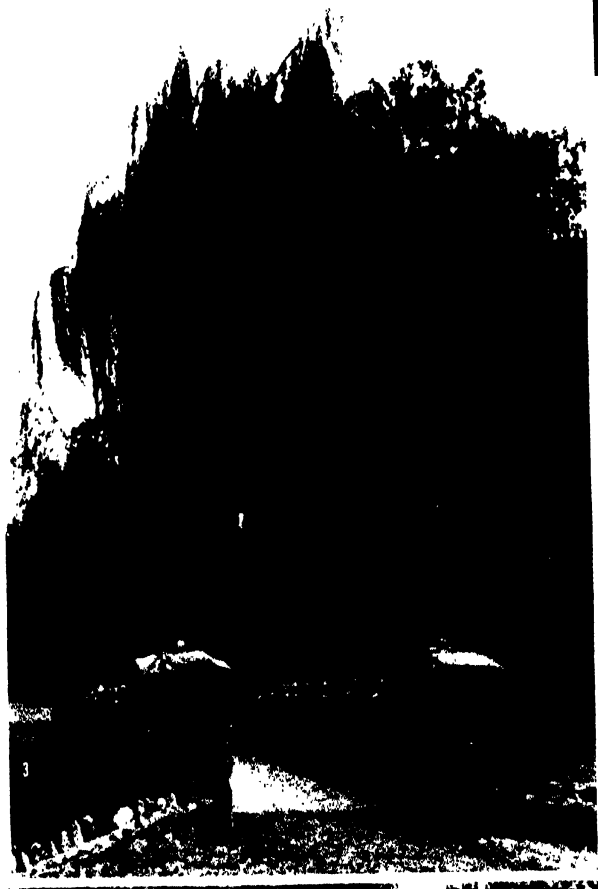
The Doughboy in Overton Park

The year 1941 will long be remembered as the date when the $20,000,000 British smokeless powder plant began producing explosives from cotton linters, 20 miles from Memphis. Also in this area is a huge shell-loading plant for the United States Army. Just outside the city limits and near the Municipal Airport is the $15,000,000 United States Quartermaster Depot. On the other side of the city is the $7,000,000 Fisher Memphis Aircraft Division of General Motors where airplane parts will be manufactured. With pardonable pride Memphians invariably round off any story of industrial expansion by referring to the $5,000,000 factory investment made by Firestone Tire and Rubber Co., in 1937.

A little more than 10 years ago Sears Roebuck and Co. invested $3,000,000 in wholesale and retail distribution units for Memphis. Sales have since proved that the appraisal of the Memphis market possibilities was justified. About a year ago this company spent nearly $1,000,000 in enlarging its physical plant in Memphis.

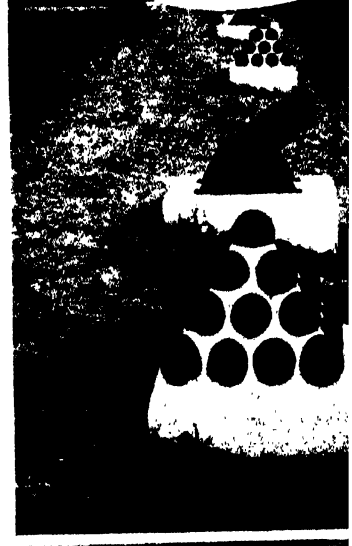
Memphis has not been a "Topsy" city—it has not just grown. The original city fathers set aside four downtown parks when the city was first laid out in 1819. As the city's boundaries spread out, the need for definite planning became apparent and in 1921 Harland Bartholomew, St. Louis engineer, drew up the Memphis City Plan. Zoning commissions have kept residential areas protected while at the same time definite parts of the city have been set aside for industrial expansion. Memphis' city plan has resulted in well laid out public parks, playgrounds, community centers, wide streets, and tree-lined parkways.

Modernized zoological gardens in Overton Park feature the moat system for displaying animals in their natural habitat. The unique monkey island, a fascinating example of this system, is inhabited by 100 India Rhesus monkeys and a goat. When the island was built several years ago, the goat was introduced to keep the grass down. He soon got used to the monkeys and let them climb on his back and ride around the island. When he tires of it, he just bucks them off. Among other interesting attractions at the zoo are the open bear pits and a pair of hippopotami with their ninth calf less than a year old. Also in Overton Park are the Brooks Memorial Art Gallery, the Memphis Open Air Theater, and a Municipal Golf Course.

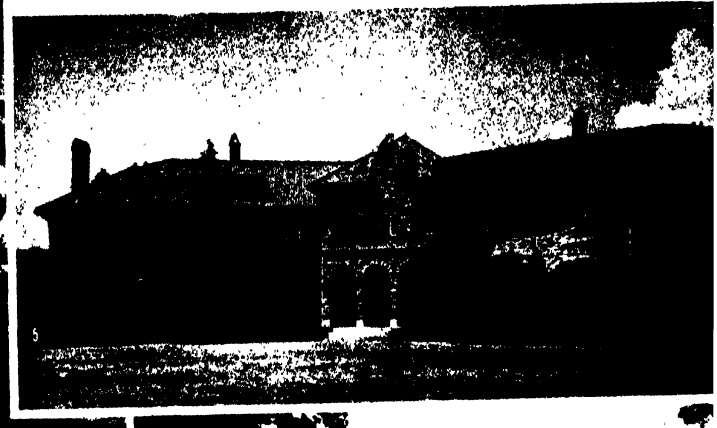


The residential subdivision of Chickasaw Gardens was once the estate of a millionaire grocer. His palatial home of pink Georgia marble, the "Pink Palace", now houses the Little Theater and the Memphis Museum of Natural History.

TO MEMPHIS A. C. S. MEMBERS



April 20 to 24



The Mississippi called DeSoto and his Spanish adventurers to the bluffs of Memphis 401 years ago. On April 20 to 24 the Mississippi calls A. C. S. members to the 103rd national meeting on the same bluffs. Meeting attendees will see modern Memphis as well as relics and monuments to its history. (1) Confederate Park. (2) The bears beg for peanuts at the zoo in Overton Park. (3) A footbridge on the Municipal Golf Course in Overton Park. (4) Fort Pickering in DeSoto Park. (5) The Pink Palace. (6) Monkey Island in Overton Park. (7) The Brooks Memorial Art Gallery situated in Overton Park.

A few years ago a park, Shelby Forest, consisting of 13,000 acres was created in a heavily wooded section on the banks of the Mississippi River a few miles north of the city. This is rapidly becoming a popular recreation area and has tourist appeal.

Glamour of the Old South still clings to Memphis. Romance and southern history abound here. Each spring brings forth memories of the past as wisteria drops its purple flowers above the old verandas and magnolias blossom in fragrant gardens. Yet Memphis is not living in the faded glory of many years ago.

Here on the bluffs above the Mississippi River is a metropolitan city made possible and perpetuated by the 2,500,000 people who live within a 200-mile radius. Below Memphis on both sides of the Mississippi River is the great agricultural empire that lies in the rich alluvial Delta. For generations this area has depended upon cotton as its main source of income. Spurred by the world economic situation and encouraged by the now nationally known Plant to Prosper program, farmers seriously began a diversified agricultural program in 1934. Last year more than 80,000 farm families in the Midsouth participated in this great agricultural adventure in living-at-home.

While the purpose of this program has been to improve farming conditions in the Midsouth and to provide other cash crops for farms where it was no longer profitable to raise cotton, there have been two striking and interlocking developments—the creation of pastures and the growth of the livestock industry. In Mississippi alone there are approximately 725,000 head of beef cattle, and officials estimate that annual cash income from beef cattle averages about $10,000,000 for Mississippi alone.

The importance of this agricultural program can hardly be overemphasized, for while Memphis has its smokestacks and its payrolls it still watches the rolling fields and the plantations, the small towns and the red hills, for it is from these sources that this Midsouth metropolis continues to draw its ever-stable wealth.

After all, Memphis has its roots in the soil and its future must always be chartered by Old Man River—the River of the Holy Ghost.

A. C. S. 100 Per Centers

ANOTHER organization joins the ranks of 100 per cent membership in the AMERICAN CHEMICAL SOCIETY.

All of the staff of the American Home Products Corp. (I. V. C. Division), Research and Control Laboratories, Richmond Hill, Long Island—S. Ansbacher, director of research, Oscar Gawron, Jerome F. Grattan, W. A. Wisansky, S. Fein, E. Gunsberg, Joseph E. Keating, and Charles La Rosa—are A. C. S. members.

The L. S. O. G. Exchange

Edited by A. A. Ashdown, Ed. F. Degering, J. E. Hawkins, and S. L. Redman

Send Items to Ed. F. Degering, Department of Chemistry, Purdue University, Lafayette, Ind.

THE Maine Section of the A. C. S., according to its constitution, exists for the encouragement and advancement of chemistry in all its branches and for the promotion of social intercourse among those interested in chemistry and the chemical industries. The majority of the members in the section are on the teaching or experimental staffs of three colleges and the state university, or are associated with the numerous pulp and paper mills of the State. There are few other chemical industries in the State.

The problems which face the section are those which result from geographic isolation and weather conditions during a large portion of the year. The plan in recent years has been to have two main meetings—one in the fall and one in the spring. One of these meetings is held in the western part of the State at Lewiston or Brunswick where are Bates and Bowdoin colleges. The other is usually at either Colby College in Waterville or at the university in Orono. Last year a third meeting was held at Portland in conjunction with a meeting of the Maine Science Club of that city. The uncertain character of the weather during the winter months and the distances which the members have to travel to attend sectional meetings make it almost impossible to plan for an important meeting during the months of most severe weather.

The membership of the section usually numbers about 50, which provides limited funds for bringing in outside speakers. In the past, however, these funds have proved adequate, especially when touring speakers have been obtained. These cooperative tours have proved extremely helpful. At the 1941 fall meeting a departure from recent years was tried when three members of the section presented papers. The success of this venture will undoubtedly lead to similar meetings in the future.—IRWIN B. DOUGLAS, Maine Section.

We are so young that probably we do not realize our problems. Financially we seem to be in good shape. This is because we have been reasonably careful in expenditures and have had relatively little expense for speakers. Nevertheless, our programs have been excellent, and we hope to maintain our level.

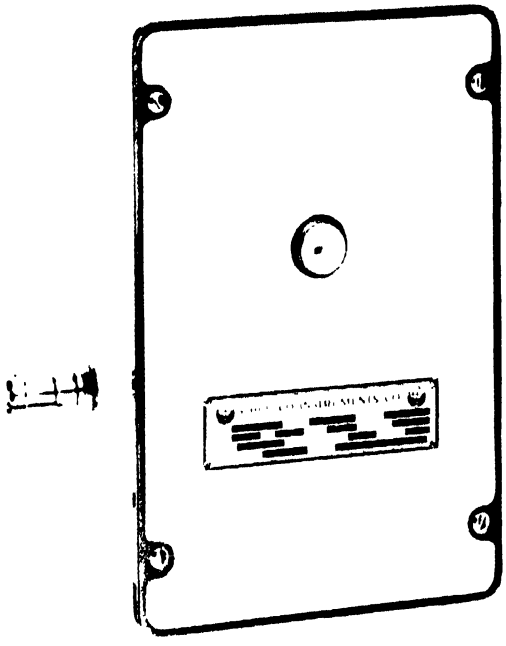
Our membership is growing, as we knew it would once we had a section charter and an active group.

We shall probably continue having one of our own group as the speaker for an occasional meeting. This of course costs us nothing. We have had three such meetings and feel that they are valuable in promoting acquaintance with each other and with the work of our members.—JOHN W. CHITTUM, Wooster Section.

As this issue of CHEMICAL AND ENGINEERING NEWS goes to press, 25 of the 365 days, or about 6.8 per cent, of 1942 will have become history. If this year is to represent the best yet for your section, approximately 7 per cent of your anticipated program should be checked off. Is it possible that you had on your agenda a column for the L. S. O. G. Exchange? If so, let us have your contribution before another month has slipped by. It is always informative and helpful to know what others are doing to solve their problems and to make this year the best in the history of their section.

The Philadelphia Section and National Defense

THE Speakers' Bureau of the Philadelphia Section of the AMERICAN CHEMICAL SOCIETY has proved so successful that it has been drafted by the Adult School Organization of Philadelphia, The Junto, to present a course in Civil Air Defense for the general public and interested defense workers.



According to Donald L. Gibson, chairman of the Publicity Committee of the Philadelphia Section, the course will include chemical warfare defense and will give a more thorough background of the problem of defense against air and chemical attack than was possible for the city to give in the special course for air raid wardens. Starting Friday evening, January 23, the course will continue for 10 consecutive Friday evenings. Most of the instructors are or were officers in the Chemical Warfare Service.

The mounting satisfaction of audiences in the Speakers' Bureau has resulted in the Upper Darby Adult School presenting a course of popular chemistry lectures by speakers from the bureau for the third consecutive term. This series, called "The Importance of Chemistry in the Service of Medicine", started January 15. In addition, the Speakers' Bureau has again been asked by Philadelphia's Adult School, The Junto, to present two series of popular talks at the spring term, beginning January 19.

DONALD L. GIBSON

CONTROL LIQUID LEVELS

without floats or contacts

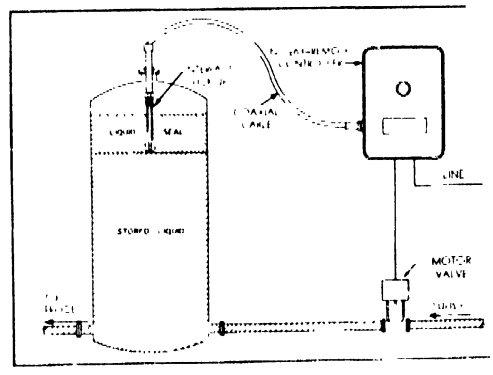
WHEELCO REMOTE CONTROLS

These *new* Remote Controls effect control action without any contact with the liquid to be controlled

They operate on a differential of .001 to .125 inches change in liquid level

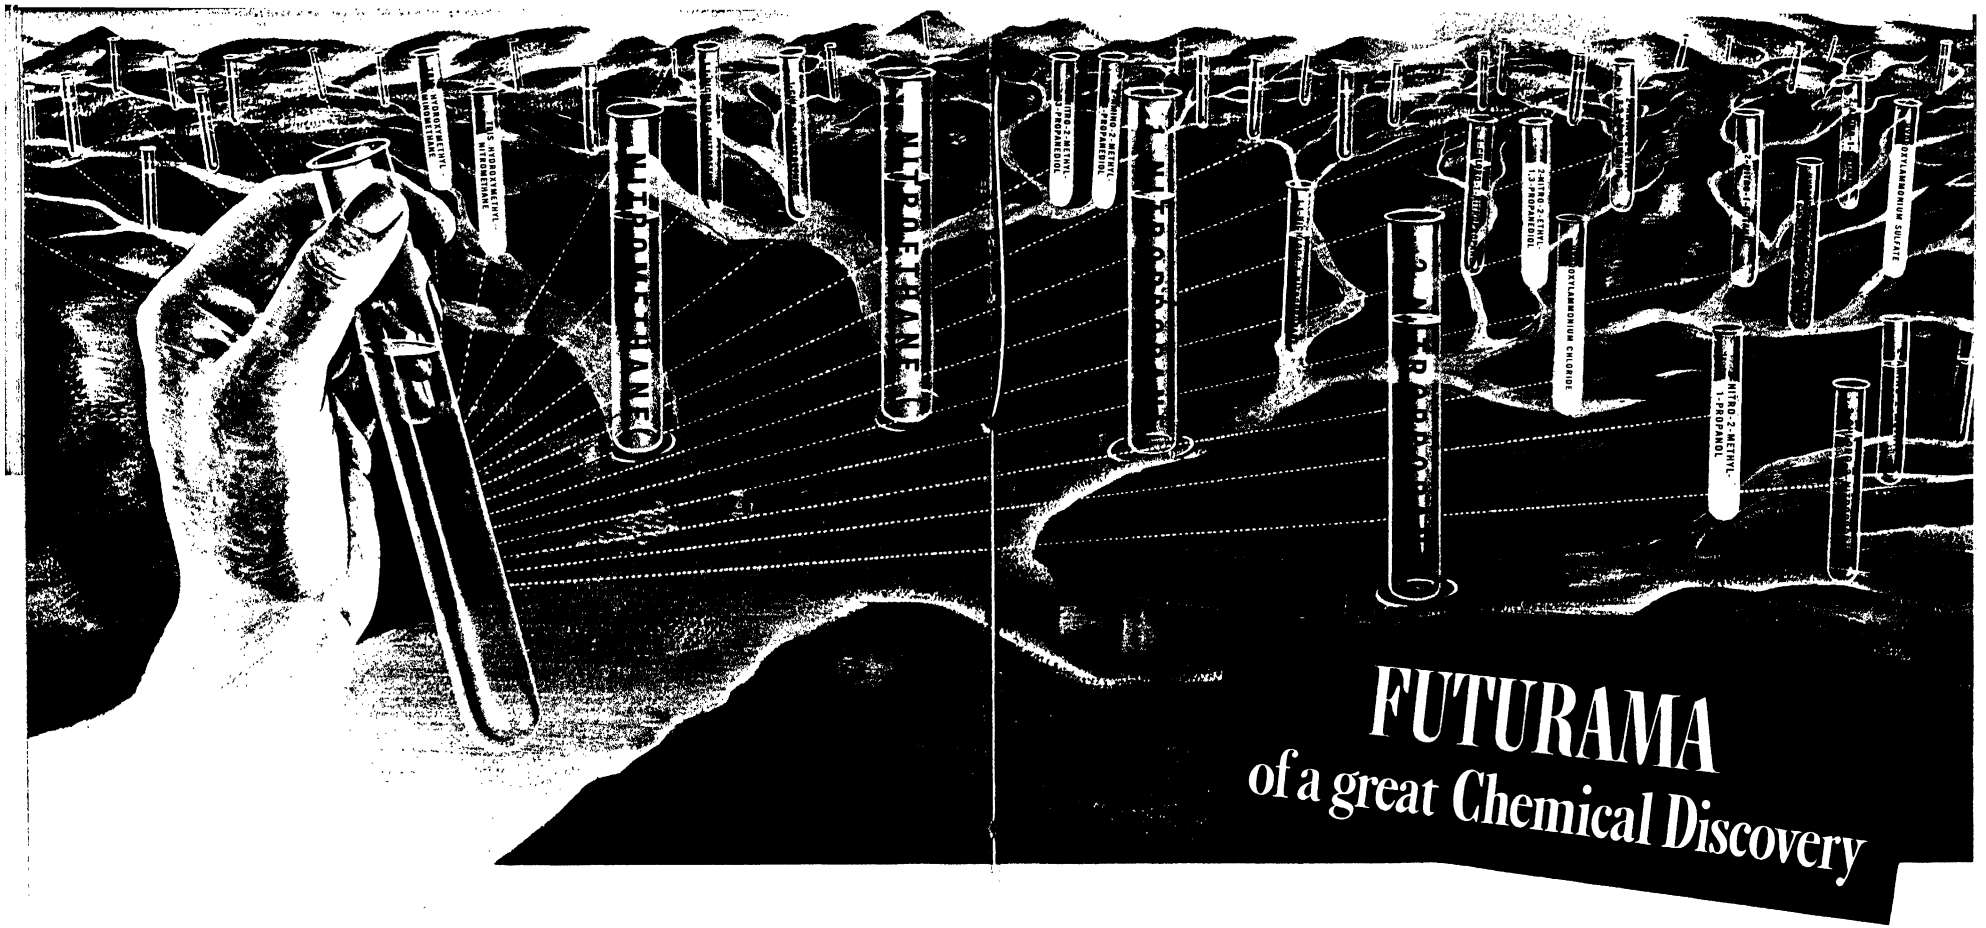
They may be used with electrolytic liquids as well as dielectric liquids having dielectric constants as low as 1.8

They are capable of controlling the INTERFACE between 2 liquids—as described below



DESCRIPTION OF OPERATION

Remote Controllers employ Wheelco's famous "Radio Principle." A "Radio Principle" Control System consists, essentially, of an electronic tube and a relay assembly. The electronic tube is maintained in an oscillating condition and thereby generates a high frequency alternating current. This current is conducted to a Pick-up Unit by means of a special cable. Any material entering the field of the Pick-up detunes the oscillator. The resulting change in current through the relay operates its contacts.



REMOTE CONTROLLERS ARE AVAILABLE FOR A LARGE VARIETY OF APPLICATIONS

Wheelco Remote Controllers can be utilized for almost any application where control is essential. Various Pick-up Units, other than the one shown, are available for special control applications.

INTERFACE CONTROL—An Interface Pick-up Unit is placed in the vessel with the tip at the point where the interface is to be maintained. A movement of the interface between the two liquids—which, for example, may be an aqueous solution and an organic material—causes control action. The Model 263 Remote Controller energizes the throttling valve motor to open or close the valve, according to the position of the interface with respect to the Pick-up Unit. At an intermediate interface position it will permit the motor to stop, thus "floating" the valve in the correct position to maintain the level desired.

For Complete Data on Wheelco Remote Controllers Write for Free Bulletin No. J2.

FUTURAMA of a great Chemical Discovery

The NITROPARAFFINS offer new opportunities for Chemical Exploration

Like the unexplored tributaries of a great river, the Nitroparaffins . . . Nitromethane, Nitroethane, 1-Nitropropane, and 2-Nitropropane . . . offer countless channels for exploration and discovery. And each new channel . . . each new derivative . . . opens rich, fertile fields to the chemical explorer.

From the four Nitroparaffins, over a thousand new and useful organic materials have already been derived . . . materials useful for their physical properties . . . valuable for their reactive qualities. These new chemicals have demonstrated their worth in many industries . . . as solvents, detergents, emulsifying agents, fumigants, insecticides, pharmaceuticals, and wetting agents. But equally important are the limitless possibilities they provide for chemical synthesis . . . serving as building blocks for the erection of new chemical structures.

"The most important advance in Chemistry since the Development of the Coal Tar Derivatives"

Seventy years ago, the *coal tar* family showed remarkable promise. Every chemist knows the rich rewards reaped by the research workers who developed those new products. Today the *Nitroparaffin* family offers comparable opportunities. New products . . . improved processes . . . lower costs . . . personal achievement . . . those will be the rewards of creative chemists with the vision and foresight to investigate *now* the Nitroparaffins and their derivatives.

Ninth National Organic Chemistry Symposium

Ann Arbor, Mich., December 29 to 31, 1941

MEMBERS of the Division of Organic Chemistry of the AMERICAN CHEMICAL SOCIETY and their guests assembled at the Horace H. Rackham Building of the University of Michigan on Monday, December 29, for the opening of the ninth biennial symposium on organic chemistry. After the meeting was formally opened by Divisional Chairman Lee I. Smith, Moses Gomberg welcomed the symposium to Ann Arbor and AMERICAN CHEMICAL SOCIETY President William Lloyd Evans responded on behalf of the Division of Organic Chemistry. Both pointed out the improved position of chemical industry and research compared with World War I days, and stressed the willingness of chemists to serve during the emergency. Later in the meeting Roger Adams spoke for the National Defense Research Council in thanking chemists who were working on war problems and expressed appreciation to the many others who have offered their services. He explained the necessity of centralizing effort on urgent problems. Suggestions and ideas on chemical war problems submitted to the NDRC will receive careful consideration.

After the introductory remarks, members of the symposium heard and discussed papers on structures, properties, and reactions of organic compounds. Papers on structure or syntheses of substances of biological importance were presented by W. E. Bachmann, Sex Hormones; Karl Folkers, Vitamin B_6; Roger J. Williams, Growth Substances; and Nathan L. Drake, who discussed the chemistry of certain substances related to cork. Organic reactions discussed included Dehydrogenation, by Homer Adkins; Chain Reactions, by M. S. Kharasch; Condensations Reactions, by Charles R. Hauser; Dehydration, Polymerization, and Depolymerization, by Frank C. Whitmore Progress in studies of particular classes of compounds were related by C. S. Marvel-Structure and Dissociation of Hexaryl, ethanes; S. M. McElvain, Ketene Acetals; R. L. Shriner, Flavilium Salts and Anthocyanidins; and L. G. S. Brooker, Absorption and Resonance in Dyes. Discussion groups were held after each morning and afternoon session.

Lithoprinted programs of 105 pages containing the material on the speakers' slides were supplied to members of the symposium. Additional copies may be obtained from the Secretary of the Division of Organic Chemistry for $1.00.

An exhibit of special apparatus useful in organic operations was held in the University of Michigan Chemistry Building on Monday and Tuesday evenings. The exhibit was well attended and attracted much interest. Members of the symposium are indebted to L. C. Anderson, who had charge of the exhibit, to the Michigan graduate students who helped to get it into operation, and to all who exhibited equipment.

The highlights of the meeting were the humble, inspiring, and very human reminiscences which Professor Gomberg related after the symposium dinner Tuesday night. Beginning with an apology for the use of the first person, Professor Gomberg sketched the beginning of organic chemis-

try in this country through his experiences. Few who heard his story will ever forget it.

Attendance at the symposium was surprisingly high. Members came from 29 states, the District of Columbia, Canada, Argentina, and Brazil. Attendance compared with previous symposia follows:

Year	Place	Registration
1925	Rochester	175
1927	Columbus	355
1929	Princeton	394
1931	New Haven	356
1933	Ithaca	274
1935	Rochester	447
1937	Richmond	466
1939	St. Louis	468
1941	Ann Arbor	488

Classsification of the registrations yielded the following:

	Registration	
	1941	*1939*
University	166	178
Industrial	213	173
Research institutions	18	29
Graduate students	86	83
Unclassified	5	5
Total	488	468

The Division of Organic Chemistry has received invitations from several local sections of the American Chemical Society to become their guests for the next symposium, scheduled for December 1943. No decision has been made concerning the place of the next symposium, and the Executive Committee of the Division of Organic Chemistry will appreciate additional suggestions.

The University of Michigan Section of the American Chemical Society and the Local Symposium Committee of M. Gomberg, W. E. Bachmann, C. S. Schoepfle, F. F. Blicke, J. O. Halford, J. M. Chemerda, E. C. Horning, and L. C. Anderson made every effort to see that the meeting ran smoothly, and their efforts are appreciated by the members of the symposium.

Arthur C. Cope, *Secretary*
Division of Organic Chemistry

National Association of Fan Manufacturers

The National Association of Fan Manufacturers, Detroit, Mich., will celebrate its 25th anniversary at its annual meeting to be held in Detroit, February 12. Its activities have been gradually enlarged to include research, engineering standards, educational work in the proper uses of air moving machinery, improved working conditions, etc. Its publications include standard methods for centrifugal fans and blowers, standard test code for centrifugal and axial fans, comparison charts for planing mill exhausters and cast iron volume fans, field test of fans, and abrasion.

Recent Developments in the Chemistry of Nonmetals

Recent Developments in the Chemistry of the Nonmetals, the topic of the Sixth Annual Symposium of the American Chemical Society's Division of Physical and Inorganic Chemistry, brought 120 chemists to Columbus, Ohio, over the period December 29 to 30, 1941. Although the competition of other meetings and the "seven-day-week" undoubtedly kept many from attending, there was no diminution in interest and in participation by those present. The program, comprising five half-day sessions, was made up of 18 papers originating about equally from university and industrial laboratories. The meetings successfully accomplished the correlation of investigations in the pure and applied aspects of several of the common nonmetals.

The social gathering Monday evening provided opportunities for conversation and "bull sessions" among old and new friends against a background of informal music and refreshments. Vocal talent among visiting chemists added to the evening's enjoyment. Many took advantage of the opportunity to visit the laboratories of the Battelle Memorial Institute and of The Ohio State University. Felix E. Held, College of Commerce and Administration, Ohio State University, addressed the group at the dinner Tuesday evening. The gathering was honored by the presence of President William Lloyd Evans and Past President William McPherson.

The symposium was arranged by a national committee under the chairmanship of W. C. Fernelius. Local arrangements were admirably cared for by A. B. Garrett, J. P. McReynolds, and L. L. Quill of The Ohio State University and R. O. Stith of the Battelle Memorial Institute.

Graduate Fellowships at Johns Hopkins

The Johns Hopkins University under its National Fellowship Plan offers graduate fellowships in chemistry. The Remsen Teaching Fellowships, named in honor of Ira Remsen, are designed for men interested in either industrial or academic research. The Chemical Foundation Teaching Fellowship is supported by funds donated by the Chemical Foundation, Inc. The York Ice Machinery Corp. is providing a fellowship for the graduate study of physical chemistry.

The stipend in each case is $1,000 annually. Applications must be sent before February 15, 1942, to A. H. Corwin, The Johns Hopkins University, Baltimore, Md.

New Courses at Brooklyn Polytechnic

Eleven new courses in chemistry and chemical engineering subjects will be offered during the second semester of the Graduate School at Polytechnic Institute of Brooklyn, which opens January 29. Courses are given one evening per week with registration starting January 22. Detailed descriptions of each subject may be obtained from the Dean of Graduate Study, 85 Livingston St., Brooklyn, N. Y.

Diatoms for Defense

A group from Dicalite Co. at dinner after a recent production-sales conference in Los Angeles. At right is C. A. Frankenhoff, president, at far end of table, A. L. Gossman, executive vice president. The purpose of the conference was to coordinate production and distribution from the company's two plants on a full wartime basis.

Engineers Discuss Applied Thermodynamics

Above. C. F. Prutton, Case School of Applied Science.

Authors of papers. *Above.* Walter Fuchs of Pennsylvania State College. *Left.* C. E. Reed, Massachusetts Institute of Technology.

Above. F. M. Whitacre of Case, member of the Local Arrangements Committee, and T. Chilton of du Pont. *Below.* C. C. Furnas of Yale, L. W. Bass of Mellon Institute, and C. F. Prutton, chairman of the Local Arrangements Committee, at the banquet.

THE eighth annual Chemical Engineering Symposium, Division of Industrial and Engineering Chemistry, A. C. S., at Case School of Applied Science, December 29 and 30, 1941, was attended by 116 engineers who heard and discussed 13 papers on aplied thermodynamics. The program appeared on page 1418, NEWS EDITION, December 10, 1941. The two-day meeting, held every year during the Christmas period to enable academic as well as industrial representatives to attend, was opened with introductory remarks by W. E. Wickenden.

A meeting of the executive committee was held at the close of the Monday afternoon session. The resignations of C. C. Furnas, chairman of the Symposium Committee, and W. L. McCabe were accepted. O. A. Hougen, University of Wisconsin, was made chairman of the Symposium Committee, C. M. Cooper was appointed in place of W. L. McCabe, and another member was added, K. M. Watson. A symposium title for the 1942 Christmas session (Process Design with Emphasis on Reaction Rates) was suggested and it was tentatively accepted by the committee. Monday evening a banquet was held at the headquarters hotel, the Tudor Arms. M. J. Rentschler acted as toastmaster and A. A. Bates, director of chemical research at the Westinghouse Electric & Mfg. Co., spoke on Metals *vs.* Plastics.

The symposium will be printed in *Industrial and Engineering Chemistry* and abstracts of the papers are available from Whitney Weinrich, Secretary, Division of Industrial and Engineering Chemistry.

During the symposium there were many requests for thermodynamic data to be used in connection with defense projects. The Cryogenic Laboratory and the new Thermochemical Laboratory of the School of Chemistry and Physics of The Pennsylvania State College will be glad to receive suggestions and inquiries as to any part it can play in obtaining adequate data as quickly as possible for use in defense studies or industries. Apparatus is available for complete entropy measurements, including vapor pressure data and heats of vaporization. Apparatus for work on accurate heats of combustion and on accurate gaseous heat capacity measurements up to 600° C. is nearly completed. Correspondence should be addressed to J. G. Aston or Frank C. Whitmore at Pond Laboratory, State College, Penna.

WORLD-WIDE CHEMISTRY

GERMANY

Increased utilization of local coal for the manufacture of synthetic motor fuel is a principal object of the planned rationalization of heavy industries in Upper Silesia, under direction of a special commissioner, Dr. Pott. With an annual output of somewhat over 25,000,000 tons, mines in the German part of Upper Silesia supplied only one fifth of the coal output of the Ruhr mines, but combined production from the German, Polish, and Czech parts of the province was about 80,000,000 tons a year before the war and may have increased since because of the transfer of industrial workers from western Germany.

Heretofore the only coal-oil plants supplied from Upper Silesia are the hydrogenation plant at Poelitz on the Baltic coast, which has a capacity of 150,000 tons or more a year of motor fuel and was originally intended to use Silesian coal as well as imported oil residues, and a much smaller one working by the Fischer-Tropsch process and operated by the Schaffgottsch interests. Several more coal-oil plants may be built in Silesia, although existence of several large hydrogenation plants using lignite and creosote only 200 miles to the west would make such an enterprise inadvisable in normal circumstances. The main difficulty at present is procuring necessary equipment. The two plants now in operation commenced production early in 1940 and took some 20 months to build.

Lacquered Cans Replace Tin Plate in Germany

Earlier experience in the use of lacquer-protected cans instead of tin plate has filled consumers in Germany with suspicions as to their suitability for food preservation, but recent advances in synthetic resins are claimed to permit use of lacquered cans for meat, fish in oil, fatty substances, and mild vegetables if these are not to be kept for too long. Usually two coats of lacquer are applied, one to ensure adhesion to the steel surface, the other to protect against corrosion. For welded and notched cans a hard lacquer is used; for cold-drawn cans the lacquer is blended with a suitable softener. More recently promising results are said to have been obtained by application of solid resin foils to steel cans. Polyvinyl chlorides, used for this purpose, give full protection against corrosion, but they absorb water during sterilization which gives them a white color. They cannot be used for welded cans.

Schering A. G. Reports Decline in Sales Abroad

Schering A. G., Berlin, a leading manufacturer of pharmaceutical products in Germany, reports that export sales for the past year have not been fully maintained, although deliveries to other European countries have increased. Sales of proprietary articles, products for the textile industry, and insecticides rose again. The subsidiary engaged in cosmetics manufacture reduced its production, but continued sales from stocks. The subsidiary concerned with photochemicals also sold from stocks and completed the "war-economical change-over". Prospects for the current business year are said to be favorable.

Synthetic Fiber Plants Draw on New Raw Materials

Use of new raw materials was discussed by several producers of synthetic fibers in Germany at recent shareholders' meetings. Flax, rape, and hemp residues, straw, reed, and thistles are among materials which have been employed experimentally or on a commercial scale. Production costs are generally higher for fiber made from these substances. Another difficulty is that some of the new raw materials, straw in particular, are difficult to obtain, with the result that the new capacity could not be fully utilized. New processes have been developed to prepare straw and residues for use in the normal machinery. One of these, the so-called Vorhydrolyse process, supplies by-products from which yeast for special protein food products can be prepared. Utilization of these by-products is to begin soon. Another new process now being tried out in a pilot plant is the so-called Direktiv process which aims at avoiding more expensive preparatory treatment by milling the raw material to a very small size. Extension of existing plants is reported from some firms working in eastern parts of Germany, but plans for one of these factories at Küstrin were delayed by lack of equipment.

While value of the thistle for spinning purposes is considered problematic, its low weight is said to make it an ideal substitute for kapok for filling cushions. The thistle fiber resembles kapok in that it has a smooth, silky touch and retains heat well, but it is not water-repellent. Thistle seed is stated to be a valuable poultry food, while the fiber is best used in conjunction with other materials.

Fertilizer Companies Formed for German-Occupied Eastern Europe

The formation of Stickstoff-Ost G. m. b. H., capital 100,000 marks, and Superphosphat-G. m. b. H., capital 20,000 marks, indicates the trend of German plans for the future of nitrogenous and phosphatic fertilizer plants taken over in annexed parts of Poland. Both these firms are to "advise" companies engaged in the fertilizer industry in the eastern territories and will carry out instructions received from the Minister of Economics. They are to cooperate closely with existing German syndicates for these fertilizers. Another company, Grossdeutscher Phosphat-Versand G. m. b. H., capital 100,000 marks, has been formed to act as the representative of the phosphatic fertilizer industry in all parts of Germany. To judge from its name, it will be concerned mainly with distribution and delivery.

Perlon Fiber Produced by I. G. Farbenindustrie

To overcome the drawbacks of the PeCe-fiber, a synthetic product derived from an acetylene basis, the I. G. Farbenindustrie has developed a new fiber, Perlon silk, described by Dr. Kleine to the Technical-Literary Society. It has a melting point above 270° C., possesses greater elasticity and strength than natural silk, has a specific gravity of 1.1, and is used for similar purposes as nylon. After spinning, the fibers are stretched to four times their length. PeCe-fiber,

EDITOR'S NOTE. Those interested in further details should address the correspondent whose name and address appear for each country, and enclose sufficient international coupons to prepay the reply. United States stamps should not be sent.

owing to its low softening point of 80° to 90° C., does not stand ironing and has proved of little value to the textile industries.

After earlier contradictory announcements it was officially stated that with approval of the governments in Berlin and Vichy the Société des Matières Colorantes et Produits Chimiques "Francolor" has been formed with a capital of 800,000,000 francs. The new company has taken over, as of January 1, 1942, the dyestuffs interest of Kuhlmann, St.-Denis, and Saint-Clair du Rhône. In return for the French dyestuffs factories, the three named firms receive 49 per cent of the shares in the new company. The German dyestuffs trust, I. G. Farbenindustrie, receives 51 per cent of the capital, but I. G. Farbenindustrie does not make any cash contribution. Instead, the three French companies are to be given shares in the German company. I. G. Farbenindustrie has undertaken not to compete with Francolor in the French interior market in so far as the new French company can supply it and will also hand over to the new company certain processes "the profitability of which under conditions prevailing in France is certain". In return the French company has undertaken not to compete with I. G. Farbenindustrie in the export business, and the three companies whose factories have been taken over will not make dyestuffs at all. Francolor will also produce certain chemical products apart from dyestuffs for distribution in France by the three founder firms, unless they decide to make those products themselves.

In justification of this transaction which subjects the French dyestuffs industry to German control, the I. G. Farbenindustrie has issued a lengthy statement referring to conditions which existed before 1914 when 88 per cent of the French dyestuffs market is said to have been in the hands of eight German firms. The capital of 800,000,000 francs is said to correspond to the internal value of the plant and equipment which was calculated "from the turnover consideration being given to the market differences between Germany and France". To finance the stocks taken over from the French founder-firms Francolor was to make use of a large franc credit.

France Plans Expansion of Magnesium Production

Although every effort is being made to increase the output of aluminum from bauxite available in large quantities in southeastern France, several leading chemical producers—Péchiney, Ugine, and Bozel-Malétra—have recently concentrated on possibilities of increased magnesium production. French output did not exceed 3,000 tons a year at the outbreak of war, but plans for extensions, which were then put into effect, are said to have made available additional plants such as the works of Lannemezan in the Pyrenees, soon to be completed. These enlargements have been furthered, also financially, by the Germans, and it is hoped that substantial quantities will be obtained before long. There are two raw material sources, the magnesium content of the Mediterranean which is to be extracted in existing salt pans near the coast and dolomite deposits in the country.

Difficulties with Motor Fuel Continue in France

Since Les Carburants Français was formed with a capital of 21,000,000 francs last spring, hopes for a substantial amelioration of the French motor fuel position by increased use of producer gas have been largely abandoned, although a new fuel basis has been developed in the form of peat deposits. Use of acetylene for automobiles has been prohibited. The authorities do not favor conversion of motor vehicles to gas generators until the raw material supply has been improved. The Paris bus company has been compelled to buy its own forests to secure enough charcoal. Sixteen thousand kilns operate throughout France, but in future no iron plates will be available for their construction. Something like 57,000 generator vehicles are said to be in use, most of them lorries, but some busses and taxis.

The General Commission for Substitute Fuels appointed last summer has investigated possibilities of producer gas, synthetic fuels, gaseous fuels, and alcohol. The only practical solution seems to be the grant of 250,000,000 francs to the Compagnie Française des Pétroles for prospecting and exploration work in southwestern France. Oil deposits are supposed to exist in Landes and Béarn, and systematic work is to be carried out in the whole of Aquitaine.

Increasing difficulties in the importation of nitrogenous and phosphatic fertilizers into Spain have caused Spanish industrialists to plan for the expansion of the production of chemical manures. It is hoped that after restoration of the Spanish mines potash output will at least cover home market requirements with something to spare for the Canary Islands.

The superphosphate trade suffers from uncertain deliveries of rock phosphates from French North Africa. Output of nitrogenous fertilizers seems to have increased, at least in so far as ammonium sulfate is concerned. A factory for the manufacture of synthetic nitrates is under construction, and it is reported that I. G. Farbenindustrie is building a plant to be operated by Nitratos de Castilla, a subsidiary of Saltos de Duero, under arrangements with the latter company. These new works may cover a substantial part of the demand for nitrates heretofore insufficiently covered by imports.

Cellulose to Be Made from Esparto Grass in Spain

Celulosa Almeriense, a company with a capital of 67,000,000 pesetas, intends to build two plants for production of cellulose from esparto grass. The factories are to be capable of a combined output of 22,000 tons a year. If commercial operations prove as successful as is hoped, a third plant will be built by the company.

Australian Subsidiaries of English Company Consolidated

A number of subsidiaries in the antipodes of Imperial Chemical Industries, Ltd., an English company, have been consolidated under an organization named Imperial Chemical Industries (NZ), Ltd., at Wellington, New Zealand. The new company is capitalized at £300,000 (New Zealand currency).

Like its parent firm, the Imperial Chemical Co. of Australia and New Zealand, Ltd., it is also a subsidiary of the English company. Formerly the various sections of the Australian and New Zealand company were represented in New Zealand by agents or subsidiaries. The subsidiary now distributes in the dominion all chemicals produced by the Australian and English companies. A move is under consideration for broadening dominion production activities whenever this seems practicable.

Australia Approaches Self-Sufficiency in Drug Output

With war stretching closer every day, Australian production of drug needs from available domestic materials has progressed to a stage where the country can be self-sufficient if overseas supplies are cut off.

Domestic production of anesthetics and antiseptics is under way, and laboratories are now working to produce sedatives, the one remaining requirement to make Australia self-sufficient in this field. The country was found to grow a large number of plants of the same genus as those from which overseas drug supplies have been made, and steps have been taken to develop such supplies as well as processes for making synthetic drugs and medicines.

POTOMAC POSTSCRIPTS

Priorities and Allocations

Burlap. Following issuance of Conservation Order M-47 limiting the use of burlap and burlap bags, officials of OPA, OPM, and OADR have been carefully considering the problem of bags for the movement of fertilizer. It is indicated that arrangements will be made for sufficient bags, either fabric or paper, for the spring's shipments. Plans have not been completed.

Cellophane. The ban on use of cellophane and similar transparent materials derived from cellulose for certain packaging or manufacturing purposes has been extended to cover a list of 24 general categories. The original ban applied to only 10 general uses.

The new order, issued as an amendment to Limitation Order L-20, is now effective and expires February 15. It does not apply to stocks of cellophane in users' hands on or before January 8, nor to stocks held by suppliers which were cut, processed, or printed prior to January 8 in such a way that they could not be used by persons unaffected by the order. Defense orders, as defined, and use of off-grade, waste, or defective cellophane also are exempt. Producers are required to make periodic reports on sales or deliveries of waste material.

Methyl Alcohol. Manufacturers accustomed to making antifreeze compounds containing methyl alcohol will be forced to seek substitutes during the coming winter months, by terms of Amendment No. 2 to General Preference Order M-31. The order, now in effect, forbids use of methyl alcohol for manufacture into, or packaging as, an antifreeze agent and applies to all stocks on hand as of January 1.

Persons having supplies of methyl alcohol originally intended for antifreeze uses are required to report all details to the Chemicals Branch of OPM, and in the meantime must hold such stocks for disposition as ordered by the Director of Priorities. Exempted from the prohibition are orders placed by the armed services of the United States, and the governments of Lend-Lease countries.

Substitutes for methyl alcohol are available.

Polyvinyl Chloride. The Priorities Division has announced Amendment No. 1 to Preference Rating Order M-10, the polyvinyl chloride order, which extends the effective term indefinitely.

Sheet Steel. General Preference Order M-45, affecting sheet steel for steel drums to be used for overseas shipment, has been amended so that hot rolled sheet steel of any gage may be used for the manufacture of sheet steel drums and the drums may be used for all kinds of products shipped overseas. The original order restricted sheet steel for the manufacture of steel drums to 16- and 18-gage and the use of the drums to shipment abroad of oil, gasoline, and petroleum products.

The order was also amended to make its expiration date indefinite.

At the same time, Preference Rating Order P-76 was amended to enable manufacturers of steel drums for foreign shipments to acquire sheet steel of all gages for such purposes. The original order covered only 16- and 18-gage steel.

Sugar. Support of the Nation's beverage distilleries in the war effort was enlisted with issuance of the third of a series of orders designed to conserve sugar. The orders affect molasses, ethyl alcohol, and distilled alcoholic beverages.

Order M-69 provides that all distilleries which have the facilities to manufacture 190-proof ethyl alcohol from corn or grain shall use them only in the production of that type of alcohol, effective January 15. It is estimated that 60 per cent of the distilling industry's capacity is subject to the order.

Order M-69 also provides that from time to time the Director of Priorities will direct that specified deliveries of 190-proof alcohol be made, such as to smokeless powder plants, for Lend-Lease requirements, or to industrial alcohol plants for denaturing and storage or distribution.

The two previous orders are M-30, limiting certain less essential uses of alcohol, and M-54, which limits many less essential uses of molasses. Purpose of the three orders is to reduce consumption of molasses, from which the bulk of ethyl alcohol is produced. Requiring distilleries which can produce ethyl alcohol from grain to do so will relieve the molasses situation. With less molasses going into alcohol and other manufactures, more refined sugar can be produced. Alcohol demand is up 300 per cent over normal because of its use in manufacturing explosives and plastics, and this constitutes a drain on sugar which the series of orders is designed to eliminate.

Some modification of the distillery order may be possible later, depending upon the outcome of legislation now before Congress. A present federal law prohibits the manufacture of industrial alcohol and alcoholic beverages in the same plant. A change in this law has been asked to permit distilleries to produce alcohol for war demands and to produce beverages after alcohol demands have been met.

Sulfite Pulp. A program to allocate sulfite pulp among the regular customers of three producers whose plants are widely engaged in war work has been announced by the Director of Priorities. During January, 4,200 tons of sulfite pulp will be set aside under the program.

Under General Preference Order M-52 sulfite pulp will be made available to the regular customers of Rayonier, Inc., Brown Co., and Eastern Corp. These three firms, which together have an annual pulp producing capacity of approximately 500,000 tons, are using part of their facilities to produce nitration pulp for explosives.

The order, effective January 9, requires all sulfite pulp producers in the country, some of whom are not immediately able to produce nitration pulp of the required quantities, to contribute proportionately part of their production each month to make up the tonnage to be allocated.

The Pulp and Paper Branch of OPM felt that an allocation program offered the best method of avoiding shutdowns of mills usually served by Rayonier, Brown, and Eastern. The mills could not purchase pulp directly from other producers because market supplies were completely covered by existing contracts. No immediate way could be found to supply the mills by increasing domestic consumption or imports.

Synthetic Rubber. The synthetic rubber order, M-13, has been changed by the Director of Priorities to include in its provisions new types of synthetic rubber developed since the original order was written and to extend it indefinitely. All types of synthetic rubber are subject to complete allocation by terms of the revised order.

Synthetic rubber has been produced in this country since 1931. Production was small until war demands caused a large expansion in 1941. Production in 1940 was about 4,000 tons and is expected to reach a rate of more than 140,000 tons by the end of 1942. Practically all present synthetic rubber, about 12,500 tons in 1941, is used for war production in self-sealing gasoline tanks for airplanes, linings for tanks, and the like.

Tin. Use of tin, except in cans and containers, has been rigidly restricted in Conservation Order M-43-a. Twenty-nine items for which tin cannot be used after March 31 are listed. Consumption of tin in specified items between January 1 and March 31 is limited to 50 per cent of the amount used in the corresponding period of 1940. No restriction is placed on use of tin for cans and containers other than those already in force. A conservation order to be issued shortly will limit the production and use of cans and containers.

All manufacturers using tin, except for containers and for the uses listed in the

order, must limit their consumption in any calendar quarter, starting January 1, to 50 per cent of the amount used in the corresponding quarter of 1940. Exceptions, to the extent that substitutes are impractical, are items produced on ratings of A-1-j or higher, for certain governmental agencies or to comply with underwriter or other safety regulations.

The order covers tin, tin alloys, and scrap, with the exception of tin in type-metal for re-use in the printing and publishing trades. General Preference Order M-72 makes Priorities Regulation No. 1 applicable to all transactions in tin and lead scrap and provides for monthly reports by scrap dealers and consumers. A scrap dealer is forbidden to accept deliveries unless, during the preceding 60 days, he has disposed of scrap in an amount equal to his inventory on the date of delivery. Provision is also made for direct allocation of tin or lead scrap if this is necessary.

It is expected that Order M-43-a will eliminate a potential demand for 15,000 tons of tin in 1942.

Tung Oil. Tung oil has been placed under strict priority control by General Preference Order M-57. Stocks of tung oil, obtained chiefly from China, are relatively low and domestic production is small. Arrangements are being made for Defense Supplies Corporation to purchase all existing supplies and all future imports.

By the terms of the order, deliveries of tung oil are prohibited except to fill the following orders, and use of tung oil is prohibited except in connection with such orders: defense orders having preference ratings of A-2 or better; placed by Defense Supplies Corporation; for the manufacture of can linings for cans to contain food products for human consumption; for the manufacture of outside can coatings where wood oil is essential to withstand normal food processing; for uses to comply with Underwriters' Regulations, Health, Sanitary or Safety Regulations, or laws issued by Government authority, provided the pertinent provisions of such laws or regulations were in effect both on December 1, 1941, and on the date of such use and specifically require the use of tung oil or a product required specifically to be made from tung oil.

Provision is made for appeal to OPM in cases involving special hardship.

Price Regulations

Acetic Acid. A single ceiling price of 6.93 cents per pound, f. o. b. works in tank cars, has been established for acetic acid, whether of wood or synthetic origin, in an extensive revision of Price Schedule No. 31 issued by OPA. Other changes include specific provision for exports; an increase in the ceiling prices for acetic acid sold in barrels and drums; separate maximum prices for western territory; and several revisions in the text for purposes of clarification.

Establishment of a uniform ceiling price for acetic acid of any origin follows three months of observation of the operation of OPA's original schedule, issued September 25. At that time separate maximum prices of 7.25 cents per pound for acid of wood origin and 6.25 cents per pound for acid of other origin were imposed. These were delivered prices and applied to glacial acetic acid and to weaker acetic acid of commercial grade in terms of 100 per cent acid content.

The ceiling price of 6.93 cents a pound was arrived at by using the 7.25-cent "wood origin" price and deducting the 32-point freight absorption that had applied to producers of "wood origin" acid. As revised, the maximum price is f. o. b. works in tank cars to all sellers.

In the case of export sales, excepting sales to Canada and Mexico, the amended schedule allows the addition to the maximum prices of 3 cents per hundred pounds when the sale is more than 3,000 pounds but less than 5,000 pounds; 1.5 cents per hundred pounds when the sale is 5,000 pounds or more but less than 25,000 pounds; and 1 cent per hundred pounds when the sale is 25,000 pounds and more. On sales to Canada or Mexico, domestic ceiling prices apply.

Ceiling prices for various concentrations of technical and pure acid when sold in barrels or drums in carload quantities, f. o. b. seller's shipping point, have been increased by amounts ranging from 20 to 70 cents per one hundred pounds. The differentials for carload sales in carboys or cases and for less-than-carload sales of 3,000 pounds or more in barrels, drums, carboys, or cases have been retained.

On the Pacific Coast, according to the revised schedule, maximum prices range from $7.29 to $16 per hundred pounds in carload lots in barrels and drums, f. o. b. seller's warehouse in western territory. The same differentials as apply to eastern territory are allowed for sales in carboys or cases and for less-than-carload sales of 3,000 pounds or more in barrels, drums, carboys, or cases.

The revised language of the schedule specifically excludes the cost of containers from all of the maximum prices. In this connection, Leon Henderson, administrator, stated that careful check would be made to see that container prices were not inflated. Any unreasonable charges for containers will be dealt with as an evasion of the schedule.

Copper Scrap. Permission to buy for chemical use limited amounts of specially prepared copper scrap at a price higher than the ceiling has been granted to three chemical producers by OPA.

The premium price approved is 11.25 cents a pound, f. o. b. shipping point, which compares with the ordinary ceiling of 10 or 10.5 cents a pound, depending on the quantity purchased. Respective monthly requirements of the three chemical concerns are 50, 120, and 125 tons and their purchases at higher-than-ceiling prices are limited to these amounts.

To meet rigid manufacturing requirements, extra cost to dealers is involved in preparing copper scrap for these three users. The price which they have been permitted to pay is the same as that permitted in Price Schedule No. 20 (Copper Scrap) for users of crucible copper, which requires approximately the same amount of preparation.

Each of the companies has been authorized by OPM to purchase copper scrap and is required to report its purchases of copper wire to OPA at the end of each month. OPA reserves the right to review its decision at any time and to reconsider the whole matter at the end of six months.

Fats and Oils. Using October 1, 1941, market levels as the "ceiling standard", Price Administrator Leon Henderson has issued a revised schedule of maximum prices for some 1,800 fats and oils. The original temporary schedule, announced on December 13, 1941, set the fats and oils ceiling at the levels of November 26, 1941. The effect of changing the temporary ceiling base date back to October 1 is to raise the general level of fats and oils prices by a minimum of 11 per cent.

Except for butter, essential oils, and mineral oils, the revised schedule covers all raw, crude, and refined fats and oils and their by-products and derivatives, as well as greases. Specifically excluded are sales of fats and oils (except olive oil) through wholesale and retail channels; sales directly to the baking, restaurant, hotel, and other cooking trades; and sales of lard destined for human consumption without further processing. By-products, as used in the schedule, means substances obtained in the course of processing or treating the fats and oils.

The schedule provides that any changes since October 1, 1941, in ocean freight, war risk insurance, and marine insurance rates shall be added to or deducted from the established maximum prices.

Steel Barrels or Drums. The price schedule covering used steel barrels or drums has been modified to assure dealers an adequate operating margin. Effect of the change is to establish a ceiling price of $1.25 each for "raw" used steel barrels or drums (50- to 55-gallon capacity, 18-gage steel) when sold by the emptier to any person. Formerly the schedule only imposed this ceiling price when such drums were sold direct to users. This left sales by emptiers to others than users free of any restriction. Prices were bid up and, since dealers could only charge $1.60 upon the resale, their operating margins narrowed to the point that they were in danger of being forced out of business.

The Chemist and Chemical Engineer in Civilian Defense

Some months ago the Office of Civilian Defense was set up by proclamation of the President of the United States, and now that the country is actually at war there is considerable activity which becomes greater as one nears the seacoast. Many chemists are properly interested in civilian defense activities and they, as well as others in the profession, are being asked endless questions about gas, how to detect it and what to do about it, decontamination problems, how to handle incendiaries, what to do for first aid in case of gas attacks, and the line of questioning often applied to chemists usually follows.

Those who have been trained in chemistry and chemical engineering do have a special knowledge which can be put to great use in civilian defense and naturally those qualified are anxious to discharge their full duty. On January 5 the Secretary of the American Chemical Society addressed a letter to local sections, suggesting that each section have a committee of its own to cooperate with local defense councils since there are a number of questions involved that require chemical knowledge. It was not suggested that local sections initiate other activities which would be likely to complicate rather than to help matters, and it was pointed out that, in the Secretary's opinion, the members of our local sections and others can best aid their country by simply offering cooperation with local organizations which have been or will be established.

Since this letter was mailed a considerable number of publications have come from the press for the use of the Office of Civilian Defense. There is a group of planning guides for distribution to staff executives and appropriate committees. There are memoranda for the use of technical personnel, textbooks for technical personnel and instructors, lectures for instructors, a considerable number of training guides, also for instructors, and several handbooks prepared for individual issue to enrolled volunteers. These publications are to be ordered through the state council, office of Civilian Defense, or local offices of this agency. Four publications will be of special interest to the average chemist or chemical engineer, while others who can give more time to this activity will wish additional publications and perhaps the entire set.

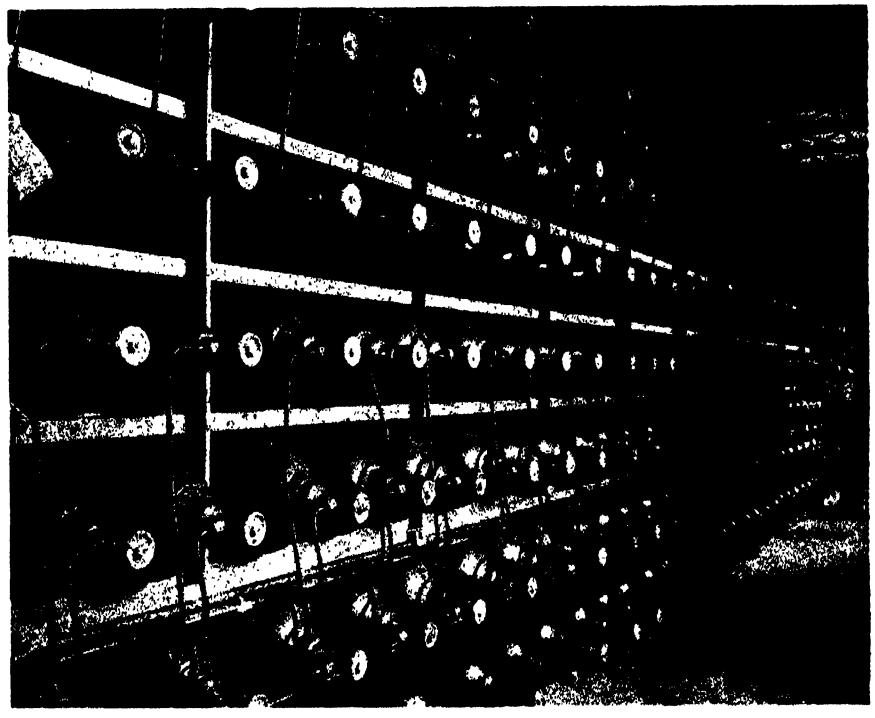
We recommend that those interested equip themselves with Textbook No. 1, "Protection against Gas"; Textbook No. 4, "First Aid in the Prevention and Treatment of Chemical Casualties"; Training Guide No. 15, "A Training Guide for Decontamination Squads"; and Handbook No. 6, "Handbook for Decontamination Squads".

Any questions on the activity or any of its phases should be put to the Chief of the Chemical Warfare Service, Civilian Defense Division, Building F, D and 23rd Sts., N. W., Washington, D. C.

Symposium Scheduled by Society of Rheology

Viscosity, Molecular Size, and Molecular Shape is the subject of a symposium to be sponsored by the Society of Rheology at Brooklyn Polytechnic Institute, February 20. M. L. Huggins, Eastman Kodak Research Department, will speak on "Theoretical Fundaments Concerning the Connection between Viscosity, Molecular Size, and Molecular Shape". "Experimental Methods and Facts" will be discussed by M. A. Lauffer, Rockefeller Institute for Medical Research".

Western Reserve Gives Lecture Series



Western Reserve University will present 12 of America's distinguished scientists in a series of lectures, "Frontiers in Chemistry", on successive Fridays beginning February 13. Each speaker will present two related lectures—one from 5:15 to 6:05 P. M. and the second from 7:35 to 8:25 P. M. Parts I and II may be taken separately at $10 for each part. Applications should be made to Wilbur W. White, Dean, Graduate School, Western Reserve University, Cleveland, Ohio.

Part I. Chemistry of Large Molecules

Feb.	13	H. Mark. Kinetics of Polymerization, X-Ray Evidence in the Field of High Polymers.
Feb.	20	E. O. Kraemer. Colloid Aspects of High Polymeric Chemistry, Ultracentrifuge Studies, etc.
Feb.	27	C. S. Marvel. Organic Chemistry of Vinyl Polymers.
March	6	R. M. Fuoss. Studies of the Electric Properties of High Polymers.
March	13	H. Eyring. Viscosity Theory and Its Applications.
March	20	Emil Ott. Chemistry of Cellulose and Its Derivatives.

Part II. Chemical Background for Engine Research

April	3	E. F. Fiock. Survey of Combustion Research.
April	17	F. Rossini. Thermodynamics in Relation to Hydrocarbons and Their Combustion.
May	1	F. C. Whitmore. Synthetic Methods for Hydrocarbons.
May	8	G. von Elbe. Kinetics of Flame and Combustion.
May	15	B. Lewis. Experimental Side of Combustion Research in Engines.
May	22	O. Beeck. Some Physicochemical Aspects of Lubrication.

Reducing Oxygen Hazards

Oxygen hazards are reduced by housing cylinders in a separate building 350 feet away from the new Westinghouse Fluorescent Lamp Plant, Fairmont, W. Va. The oxygen in the cylinders at 2,000 pounds pressure is connected to a manifold system and reduced to approximately 100 pounds. It is then piped underground into the main building and reduced to about 10 pounds pressure for use on lamp machinery which requires oxygen and gas or air. To eliminate corrosion and reduce possible hazards in the oxygen gas lines, all the piping and fittings are made of copper. Special pipe-line filters at each machine take out foreign material. The oxygen is delivered in liquid form by a service truck fitted with special devices to convert the liquid into gas and pump the 2,000 pounds pressure into the cylinders.

C. S. Examinations for Junior Assistants and Student Aids

THE United States Civil Service Commission has announced the annual junior professional assistant and student aid examinations designed to recruit young college graduates and junior and senior students for positions in the government service. Applications must be on file with the commission's Washington office not later than February 3.

Optional branches included in the junior professional assistant examination are agricultural economist, agronomist, aquatic biologist, archivist, bacteriologist, biologist, chemist, entomologist, forester, geologist, junior in household equipment, olericulturist, pomologist, public welfare assistant, range conservationist, soil scientist, State Department assistant, and statistician—all in the junior grade at $2,000 a year. A four-year college course leading to a bachelor's degree is required, with major graduate or undergraduate study in the field of the optional subject. Senior or graduate students may be admitted to the examination, and may upon attaining eligibility receive provisional appointment, but cannot enter on duty until evidence of successful completion of the required college course is furnished. Applicants must not have passed their 35th birthdays.

In the student aid examination are four optional subjects—engineering, political science, public administration, and statistics. Applicants must have completed at least three years of college study, and must have indicated at the college or university their intention of majoring in the optional subject chosen. No applicant may enter the examination who completed the third year of college study prior to May 1939. Provision is made for the acceptance of applications from junior students who expect to complete their junior college year not later than July 1, 1942. Student aid positions pay $1,440 a year. Usually employment is during the school vacation periods. When furloughed, appointees may return to their college studies. Applicants for these positions must not have passed their 30th birthdays.

Copies of announcements and application forms may be obtained at first- and second-class post offices or from the Civil Service Commission, Washington, D. C.

New-Tread Tire

Application of Firestone camelback is the first step in making a New-Tread tire from one that is worn smooth. It will be vulcanized to produce a tread capable of giving up to 80 per cent of the original mileage of the tire. Each retreaded tire consumes less than one half of the rubber required to make a new tire of the same size.

Kodak Announces Nitrogen Isotope N^{15}

NITROGEN isotope of atomic weight 15 (N^{15}) is now available in the form of ammonium nitrate in which the nitrogen of the ammonium radical has been enriched by the chemical exchange method of H. C. Urey[1]. Two concentrations are available—approximately 30 atom per cent N^{15} and approximately 7 atom per cent N^{15}.

The material is to be sold on the basis of N^{15} in excess of normal concentration. The price will be 15 cents per milligram of N^{15} at approximately 7 atom per cent concentration and 20 cents per milligram of N^{15} at approximately 30 atom per cent. As this is a special research laboratory product, distribution will be on a direct basis only. No discounts will be given from the above prices. Standard packaging units will be 100 mg. or multiples thereof.

Orders or communications should be sent to the Eastman Kodak Co., Research Laboratories, Department WOK, Building 59, Kodak Park Works, Rochester, N. Y.

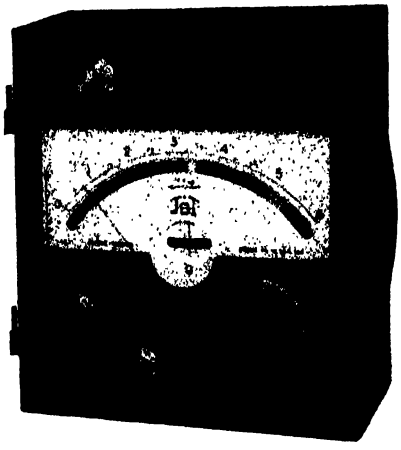
75 Years of Service

TO CHEMICAL USERS

This year, the 75th Anniversary of Mallinckrodt Chemical Works, we can look back with modest pride on a long period of achievement and service to users of chemicals for cosmetics, pharmaceuticals, laboratory, industry, and photography. From a humble beginning in 1867 with a little one-story plant and four employees, Mallinckrodt now renders nationwide service from one hundred factory and office buildings in the U. S. and Canada through a staff of over 1500 men and women. A few simple materials first manufactured by Mallinckrodt now have become more than 2000 items. Today there is hardly a field of endeavor in which Mallinckrodt chemicals do not play their part.

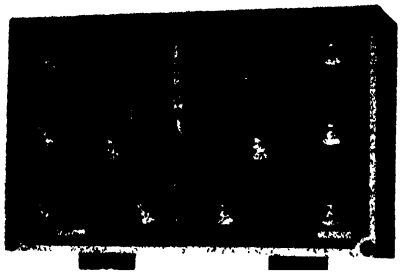


The words of one of our founders, Edward Mallinckrodt, spoken years ago, express the ideals of Mallinckrodt: "We realized from the start that business depends on reciprocal relations and confidence; that we would have to establish a reputation for fair, honorable, liberal dealings and to make it to the interest of the buyer to place his orders with us, by supplying service and endeavoring to satisfy our customers as far as possible in every respect."

MALLINCKRODT CHEMICAL WORKS

Serving Chemical Users For Seventy-Five Years

DEPENDABLE INDICATION



of Industrial Temperatures SUB-ZERO TO 3000° F !

Whenever accurate knowledge of temperatures is required: for process protection, for testing samples and apparatus, for remote reading of thermocouple temperatures (in degrees F. or C., millivolts or milliamperes), J-B-T Model 70-PO is a permanently efficient and reliable standard.

MODEL 70-PO is a direct deflection potentiometer-pyrometer that requires no standard cell and can be depended upon to maintain its calibration almost indefinitely. Once adjusted for the particular thermocouple being used, readings on scales of 0–4000° F. and over can be made without any further balancing. On lower ranges, only one balancing per reading is required. The instrument is especially useful in following changes as they occur, to an accuracy within ½ of 1% total scale deflection. Model 70-PO also withstands vibration and changes in ambient temperature.

Portable or mounted models assure the convenience of thermocouple use with the reliability of the potentiometer method.

MODEL S-12-11 SELECTOR SWITCH measures with 10 or less thermocouples in connection with Model 70-PO. Slotted adapters permit thermocouples of varied size and length to be brought to uniformity. Thereafter, readings are taken merely by rotating the knob.

Designed for use where contact resistance must be low and remain constant, the switch has an average contact resistance of .00075 ohms or less.

PORTABLE MODEL S-15-11 (not illustrated) is similar, but has carrying strap and binding posts on top for easy connection.

Catalogs gladly furnished on request.

441 CHAPEL STREET
NEW HAVEN, CONN.

NECROLOGY

James A. Branegan

JAMES A. BRANEGAN, president of the Kali Manufacturing Co., Philadelphia, Penna., died December 23, 1941. Mr. Branegan was born January 15, 1873, and was educated at Pratt Institute. From 1897 to 1899 he was chemist with the Martin Kalbfleisch Chemical Co., from 1899 to 1917 technical representative of the General Chemical Co., and since 1919 had been president of the Kali Manufacturing Co. In 1911 he was winner of the Widman Medal for original chemical work. During the World War he served in the office of the Alien Property Custodian. He was the author of "Popular Textile Chemistry", "Chemistry and Science in Prehistoric America", and technical articles. He was the inventor of the Branegan acid siphon and tin hydrometer. Mr. Branegan had been a member of the AMERICAN CHEMICAL SOCIETY since 1902.

Franklin G. Hills

FRANKLIN G. HILLS, chief chemist of the metallurgy department of the Colorado School of Mines, died December 23, 1941, at Golden, Colo., at the age of 73. Mr. Hills was on the faculty of Columbia University for six years, later was superintendent of the smelter operated by the American Smelting & Refining Co. at Leadville, Colo., and superintendent of the Colorado Fuel & Iron Co. smelter in Pueblo. In 1927 he joined the faculty of the Colorado School of Mines and had devoted his research activities principally to the discovery of rare elements in various types of ore from all over the world. He was a member of the AMERICAN CHEMICAL SOCIETY.

Harold Johnson

HAROLD JOHNSON, chief chemist of The Warner-Jenkinson Manufacturing Co., St. Louis, died December 10, 1941, at the age of 65. He had been in failing health for several years. Dr. Johnson was born in Canterbury, England, and received his early education in England. His chemical training was completed at the University of Brussels.

In his earlier career as a consulting chemist to the fermentation industries, he traveled extensively to British possessions and spent several years in India. Later he came to Canada, and in 1912, when the Warner-Jenkinson Manufacturing Co. was in its infancy, he was called to St. Louis as its first chemist. In addition to directing the development of this company's extensive line of flavors and allied products for the ice cream and carbonated beverages industries, he became interested in dyes for coloring food products during the early years of World War I. At that time the list of permitted coal-tar food colors was very limited, and reduction of imports eliminated some of them from the American market. This was especially true of the triphenylmethane dyes.

His researches resulted in the production of an American-manufactured Light Green SF Yellowish of relatively high purity, superior to the imported variety, and this was promptly accepted by the Bureau of Chemistry, U. S. Department of Agriculture for certification as a food dye.

Further work on nontoxic dyes, carried out in later years in the Warner-Jenkinson laboratory under Dr. Johnson's direction, produced three new colors—Fast Green FCF, Ponceau SX, and Sunset Yellow FCF. These were accepted by the Color Certification Laboratory and added to the official list of U. S. certified food colors.

He had been a member of the AMERICAN CHEMICAL SOCIETY since 1921.

WE ANNOUNCE with regret the death of the following:

Rafael Aguilar-Santillan, Sociedad Cientifica Antonio, Alzate, Apartado 77–98, Mexico City, Mexico. Member since 1917.

James M. Bush, W. J. Bush & Co., Ltd., London, England. Member since 1909.

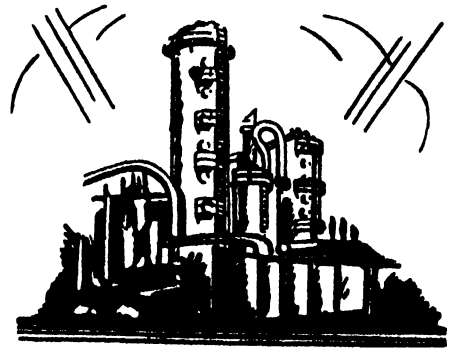
Thomas G. Elliot, Messrs. Hadfields, Ltd., Sheffield, England. Member since 1935.

Francis E. Francis, University of Bristol, Bristol, England. Member since 1930.

Edwin R. Hadley, Venice High School, West Los Angeles, Calif. Member since 1935.

Ralph W. Higbie, assistant professor of chemical engineering, Speed Scientific School, University of Louisville, Louis- St. Louis, Mo. Member since 1920.

Robert E. Kresge, chief chemist, American Rolling Mill Co., Butler, Penna. Member since 1927.



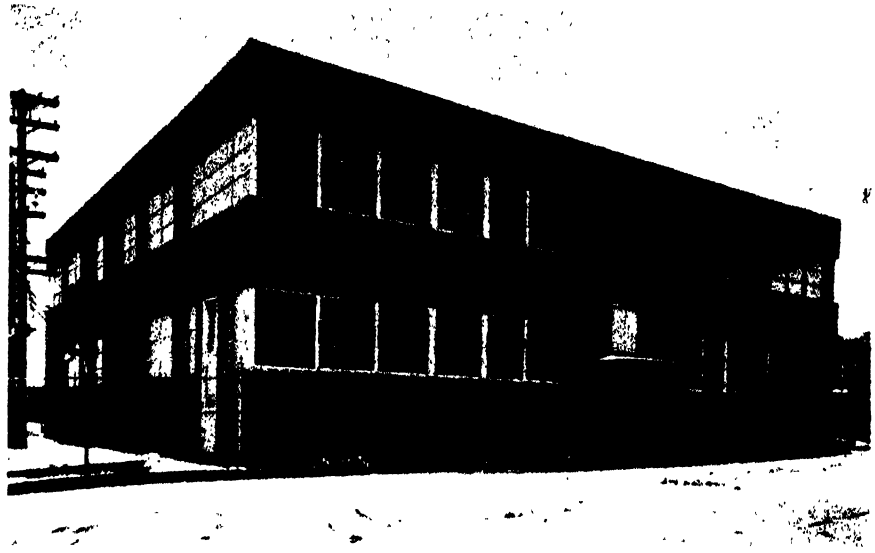
A. J. Murphy, managing director, Murphy & Son, Ltd., Wheathampstead Herts, England. Member since 1912.

W. C. R. Murray, Oakland, Calif., Clorox Chemical Co. Member since 1923.

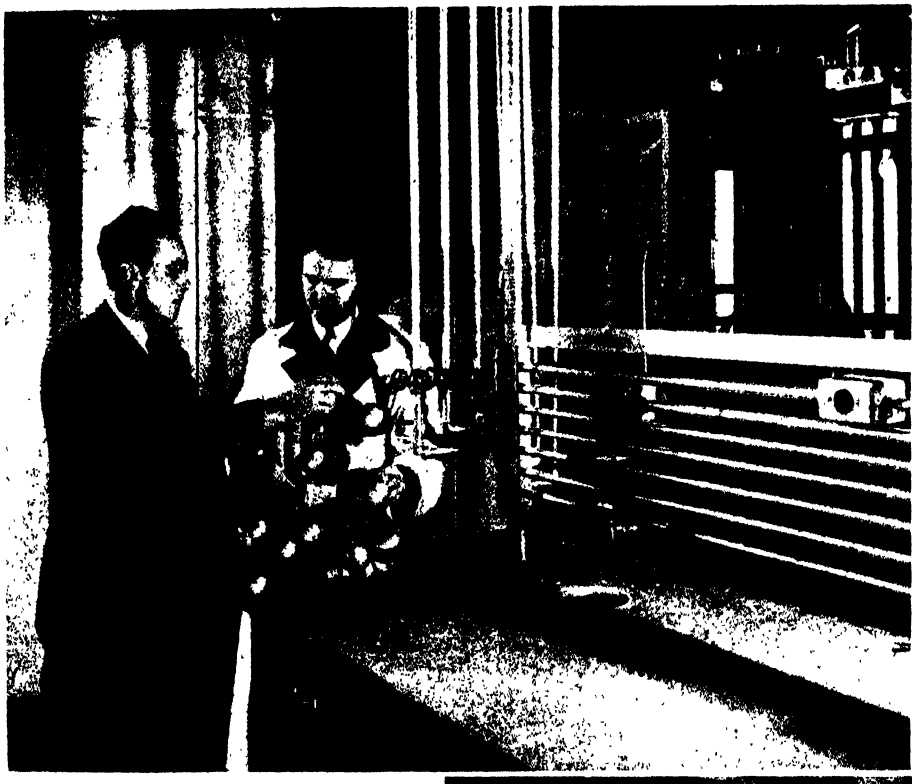
Axel W. T. Nibelius, 32 West 40th St., New York, N. Y. Member since 1906.

George R. Pensel, vice president, Ritter Chemical Co., Inc., Amsterdam, N. Y. Member since 1917.

Leland M. Willey, General Electric Co., Schenectady, N. Y. Member since 1907.



EXPLORER . . . 1942

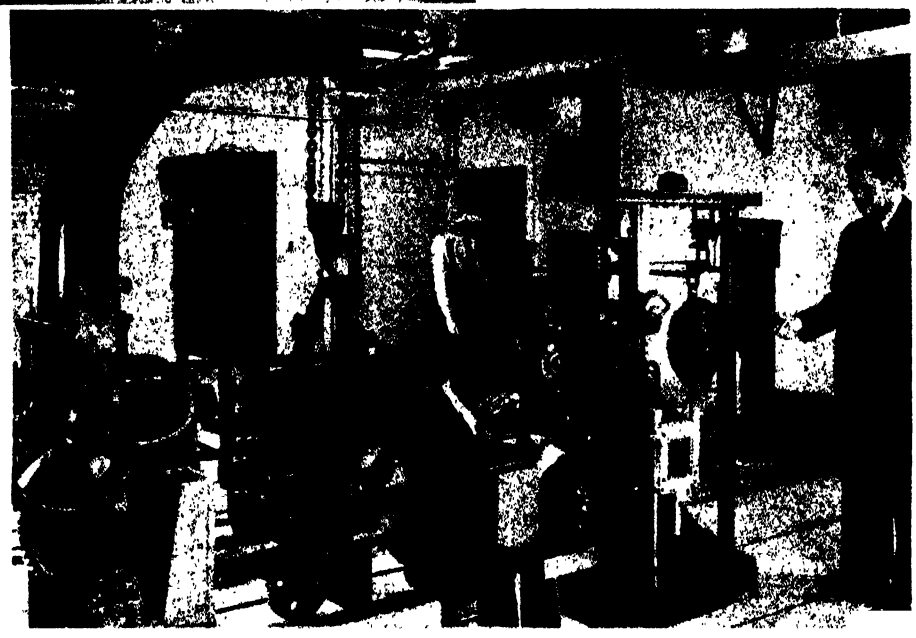


In the field of exploration, the binoculars have given way to the microscope! For with virtually all of the geographic world and its resources known, man has now turned his attention toward the fullest utilization of these resources. ¶ In them, he finds new realms of discovery. And these are mightily affecting our industrial lives . . . methods . . . products . . . and costs. Yet, great as his discoveries have already been, man has barely ventured "out of sight of land"! ¶ In the field of Centrifugal Force, for example, Sharples Engineers and Chemists have traveled far in the last quarter-century. But as they reach a goal they see another . . . then, after that, still another! Food . . . paint . . . petroleum . . . textile . . . shipping . . . automotive . . . and chemical are a few of the industries already profiting by the utilization of this force. Others have similar opportunities . . . and Sharples will gladly cooperate!

THE SHARPLES CORPORATION

New Petroleum Research Laboratory Formally Opened

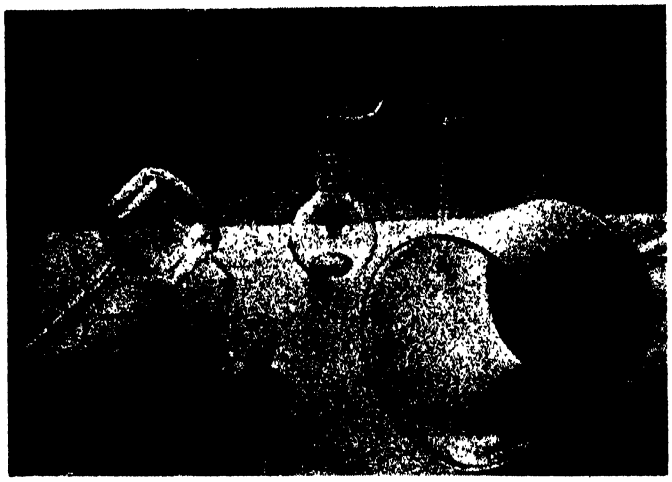
Sohio's new research laboratory adjacent to the Western Reserve University campus



THE Standard Oil Co. of Ohio's new research laboratory adjacent to Western Reserve University in Cleveland was formally opened December 30, 1941, with a public reception, and immediately went into action on vital research problems linked directly to America's fight for victory.

Several hundred educational and business leaders inspected the modern two-story laboratory building which was located alongside the university campus to further the interchange of manpower and facilities under a long range program for cooperation between industry and educational institutions.

W. T. Holliday, president, and other officers and directors of the company were hosts at the open house. Guests were ushered through a maze of special research and testing equipment by members of the 25-man laboratory staff headed by R. E. Burk, professor of chemistry at Western Reserve and director of chemical research for Sohio.



Five separate laboratories, a large en-

New Petroleum Research Laboratory Opened

CONTINUED FROM PAGE 430

gine testing room, and cold room provided in the building combine practically every known facility for development of higher octane gasolines, Diesel oils, and other fuels, new lubricating oils and greases, better asphalt products, and new by-products of the refining process.

The research staff will be concerned with development of improved manufacturing processes as well as improvement of petroleum products and their more efficient use. For this reason one lofty room, two stories high, with a large hatch in the roof, has been provided to accommodate any experimental refinery set-up they might have occasion to erect. A completely equipped machine shop has been included in the layout and will enable the laboratory to build any required experimental equipment.

An elaborate ventilating system, specially designed to meet requirements for control of conditions in the laboratories and engine testing rooms, delivers filtered air throughout the building, ensuring a complete change of air every six minutes. While the entire structure, including the offices, has only 14,000 square feet of floor space, it has more than a mile of steel pipe in the various systems which distribute gas, water, steam, compressed air, and vacuum to the work tables, test stands, and equipment in the several laboratories.

More than 2000 different chemicals, including many rare substances not available anywhere else in the locality, will be carried in stock in the large chemical storage room on the second floor. In keeping with the cooperative principles which led to the location of the laboratory at the university campus, the rarer chemicals will be available for use by other departments of the university on a replacement basis.

Under arrangements between Sohio and the university, the company's research library in the new building will be available for use by chemistry students and the laboratory staff will have equivalent access to the university library. The company will sponsor four fellows who are studying for their doctors' degrees in chemistry and is also employing about ten Reserve chemistry students part time in the laboratory.

H. P. Lankelma, professor of organic chemistry at Western Reserve University, who has been identified with this Standard Oil research program since its inauguration in 1929, will be a consulting member of the staff which includes E. C. Hughes, senior supervisor of experiments, and Einar Kropp, chief research engineer.

Government Needs Chemists

Two examinations for chemists and biochemists are reannounced by the Civil Service Commission.

For analytical and research chemists (Announcement 185) the salary is $2,600 to $5,600 a year. Any specialized branch of chemistry is included. Analytical chemists at $2,600 to $3,200 are needed for chemical testing of materials, for compliance with specifications, checking health hazards by chemical methods, and other analytical chemistry work.

Pharmacologists and toxicologists (Announcement 186) will receive $2,600 to $4,600 a year.

In both examinations, responsible professional experience must be shown, except for partial substitution of graduate study. Provided all other requirements have been met, college teaching will now be considered acceptable for any grade of the research chemist or the pharmacologist or toxicologist examination when accompanied by a reasonable amount of scientific research in the appropriate field. Pertaining to the recency of education and experience in the chemist examination, all persons otherwise qualified may now apply, but those eligibles will be considered first who show that part of their education and experience has been acquired within the past 10 years.

Applicants must not have passed their 60th birthday, unless they are entitled to military preference, in which case they must be under the retirement age. Non-veterans over 60, otherwise qualified, may apply and their names may be listed for possible use.

The need is urgent. Both examinations are open until further notice, but qualified persons should apply at once. Persons rated eligible under the 1941 examinations—No. 25 and 58—need not reapply, for their eligibility will continue under the new examinations. Further information and application forms may be obtained from the Secretary, Board of United States Civil Service Examiners, at any first- or second-class post office or from the Civil Service Commission, Washington, D. C.

Victory Poster

Symbolizing the spirit of American industry in the greatest wartime production in history is this poster designed and produced by The Firestone Tire & Rubber Co., Akron, as an inspirational message for its employees.

BOLIVIAN refined sulfur exports in the first nine months of 1941 attained a level of 2,084 tons. Most of the production is shipped to Argentina. Deposits are reported to be fairly numerous along the Bolivian-Chilean frontier, with the largest reserves believed to be about 5,000,000 tons with a sulfur content of 65 per cent.

Horace Bassett has been promoted to the position of factory manager of the Wolverine Tube Co., Detroit, Mich.

Max Bender is now doing chemical research and development work for the Aridye Corp., Fair Lawn, N. J.

R. E. Bingham has been appointed district manager for the Indiana territory by the Jessop Steel Co., Washington, Penna., with headquarters in Indianapolis.

Lela E. Booher, for five years chief of the Foods and Nutrition Division, Bureau of Home Economics, U. S. Department of Agriculture, is now director, Institute of Nutrition, Milwaukee Children's Hospital, Milwaukee, Wis., where she is engaged in nutrition and biochemical research and in a program of nutrition education.

Bert M. Brock, for the past year director of industrial relations, Pittsburgh District, Carnegie Illinois Steel Corp., has been appointed manager of industrial relations for the John A. Roebling's Sons Co., Trenton, N. J.

Gustavus J. Esselen has been appointed a member of the Massachusetts State Board of Registration of Professional Engineers by Governor Saltonstall.

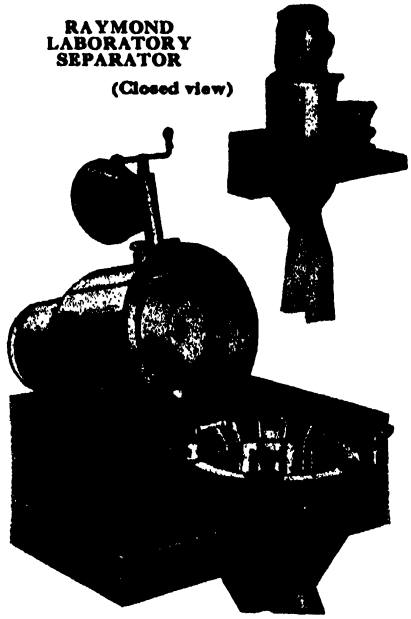
J. Harry Jackson has been appointed a research engineer on the technical staff of the Battelle Memorial Institute, Columbus, Ohio, and assigned to research in metallurgy.

Z. I. Kertesz, chief in research in chemistry at the New York State Experiment Station at Geneva, has been granted a six months' leave of absence to engage in research on the production of citrus products on a project sponsored by the Government at Dunedin, Fla.

C. J. Krister, Grasselli Chemicals Department, E. I. du Pont de Nemours & Co., Inc., Cleveland, Ohio, has been chosen as editor of *Isotopics*, publication of the regional sections of the AMERICAN CHEMICAL SOCIETY, succeeding **Gordon M. Forker**. The new business manager is **Emil W. Milan**, Lake Erie Chemical Co., who succeeds **A. G. Horney**.

D. R. McCormick has been appointed assistant chemist in the Division of Chemistry, Agricultural Experiment Station, State College of Washington, Pullman, Wash., to continue work on fruit and vegetable products. He takes the place of **A. M. Neubert**, who has been appointed to a position in the Bureau of Chemistry and Engineering, for continuation of work in the field of fruit and vegetable products in the federal laboratory located on the campus of the State College of Washington.

J. Ernest Nachod, Jr., formerly with E. I. du Pont de Nemours & Co., Inc., Wilmington, Del., has accepted a position as chemical engineer in ammonia operations with the Hercules Powder Co., Hercules, Calif.



Charles A. Reichelderfer has joined the research staff at the Battelle Memorial Institute, Columbus, Ohio, and been assigned to the division of nonferrous metallurgy. He was previously associated with the Jones and Laughlin Steel Corp.

For Tests ON POWDERED MATERIALS

RAYMOND LABORATORY MILL

RAYMOND LABORATORY SEPARATOR (Closed view)

Tilted back for easy accessibility

Many leading chemical and industrial laboratories are using these small Raymond units for experimental work and for the development of new products. Pigments, plastics, cosmetics, resins, clays, drugs, foods ceramic materials, soya bean products, and powdered samples for analysis, are typical applications.

LABORATORY MILL

This compact and sturdy Screen Pulverizer has a motor drive and hand-operated feeder. It produces the same character of finished material as the larger pulverizers. Set of different size screens furnished to give various degrees of fineness. Machine also made with motor-driven feeder . . . ask for details.

LABORATORY AIR SEPARATOR

Convenient type of unit for classifying test samples, experimental work and separating the mill grind from small pulverizers like the Raymond Laboratory Mill, described above. Furnished with set of interchangeable whizzers and fans for regulating the fineness. Motor drive and hand feed.

TIME is now a controlling factor, a factor second to none in importance. Equipment for processing must be of the right design, quickly constructed, and put into service by installation men who know each industry and its specific requirements. In most cases, the units are installed with simple push-button control.

In the fields of filtration and clarification, Oliver United has this to offer:

1 ...Thirty-five years of experience in these important steps of processing.

2 ...Many types of filters from which to select, operating intermittently under pressure or continuously under vacuum or pressure.

3 ...Knowledge gained from observing the work done by more than 15,000 units installed all over the world.

4 ...Successful adaptation of modern filtration and clarification to every process requiring these steps.

5 ...Two well-equipped and modern factories, one in the east, the other on the west coast, to provide quick construction service.

To save time and to be sure you are right, make Oliver United your source of supply for that filtering or clarifying unit.

• • • •

For pumping, remember we also make a line of efficient acid-handling and slurry pumps, known respectively as OLIVITES and O-D-S Pumps. Tell us about your pumping problems, too.

Rubber Supply Problem Reviewed

In "Rubber's Return to the Western Hemisphere", a 4-page statement by P. W. Litchfield, chairman of the board of The Goodyear Tire & Rubber Co., Akron, Ohio, the rubber situation in the United States and steps taken toward solution of the problem are analyzed and reviewed.

Dr. Litchfield concludes with a summary of how America stands today in the grave matter of rubber supply:

We have nationalized emergency stock of natural crude rubber brought from the Far East during the past year. This stock pile, wholly owned and controlled by our Government, will keep the American war machine in smooth operation for another year and probably much longer.

We have manufacturing plants for the production of reclaimed or regenerated rubber. These reclaim plants have a high total capacity and at this very moment are turning out large supplies of reclaim which can be converted into tires and other rubber products. Tires of regenerated rubber definitely do not have the wearing qualities of tires made from crude rubber but they will prevent American wheels from coming to a stop.

We are rapidly expanding our facilities for the production of synthetic rubber, and within the next 12 months under the present program our country's total capacity for synthetic can reach more than 80,000 tons per year. This can be rapidly expanded to any extent our emergency needs may require, using only materials which are produced within continental boundaries of the United States.

Rubbers which normally have a more restricted use than Hevea, such as Castilloa and Guayule, are already grown to a small extent in the Americas. Gathering and planting of these rubbers can piece out the total available supply during the period of emergency.

A substantial foundation has been laid for the development of rubber-growing areas in the Western Hemisphere. Of necessity, results in this field cannot be expected for a matter of years. This development, in the long run, will combine the factors of safety and economy to a much greater extent than any other approach to the problem.

The immediate prospect may not seem too bright, Dr. Litchfield adds, but it certainly cannot be said America is without at least a partial solution.

The statement is being sent to Goodyear stockholders, employees, and others who may be interested.

Diversified Electric Furnaces for speeding production of heat-treated parts for airplane accessories are being used by the Eclipse Division of Bendix Aviation Corp. Specially designed Westinghouse furnaces at the Philadelphia plant typify advanced practice for heat treating large and small metal parts. *Above.* Big parts are automatically bright hardened without decarburization at a rate of 500 pounds per hour, gross, by this 80-kw. electric pusher furnace using an atmosphere of re-formed city gas, Endogas. Hardened parts are loaded on the belt conveyor of this 55-kw. drawing furnace (left rear). With forced convection this furnace heat treats 360 pounds an hour, net. *Below.* Batch tempering is done by lowering a deck basket of parts into a 68-kw. pit furnace using a controlled atmosphere of Exogas, generated from city gas. Production averages 1,000 to 1,200 pounds every four hours.

Patriotic Role of Chemical Exposition Cited

If the war is a long one, the National Chemical Exposition, scheduled for November 17 to 22 at the Stevens Hotel, Chicago, expects to play an important part in winning it, says Victor Conquest, chairman of the Exposition Committee of the Chicago Section, American Chemical Society. It is generally conceded, he adds, the winner will be the country that can advance the fastest technically with its methods, materials, and machines. Rapid technical advances create unprecedented problems, and quick solutions require personal contact, not only between individuals, but with materials and machines, according to Mr. Conquest. The National Chemical Exposition and the National Industrial Chemical Conference will bring together an audience from almost every state in the Union with urgent problems to solve.

Within three weeks after the distribution of floor plans of the National Chemical Exposition, a little over 85 per cent of the space was reserved. Two additional halls have been added to accommodate the increased number of exhibitors expected to participate.

THE OHIO TORCH
with *finger-tip* control

Gas Mixture Adjustable with ONE Hand

Finger-tip control enables the operator of an Ohio Torch to adjust the gas mixture with one hand.

Compact, The Ohio Torch is invaluable in any laboratory for:

Light Welding	Melting Metal
Soldering	Melting Alloys
Brazing	Working Pyrex
Lead Burning	Working Quartz Glass

Adapted for use with oxygen, equal-pressure acetylene, low-pressure acetylene, city and natural gas and liquid-fuel gases.

Torch outfit No. 6751, consisting of Ohio Midget Torch, tubing and special needle-valve yoke assembly, complete, less cylinder.. $16.00

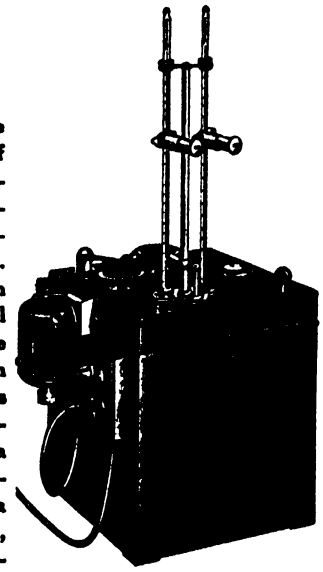
3 TIMES THE CUTTING POWER
of Fire Line Pressures!

The Sellers Hi-Pressure Cleaning Jet converts steam at 50 to 125 lbs. pressure with ordinary water supply to a high pressure hot-water cleaning jet with a temperature of 180°–190° F. and a nozzle velocity up to 270 lbs. This jet (which contains a solvent) cuts heavy dirt and grease from equipment, machinery, pumps, truck and tank cars, floors, stair treads, quickly and thoroughly. Stationary or portable types available.

For cleaning heat exchanger bundles, cooling or heating coils, and other hard-to-clean apparatus.



SELLERS HI-PRESSURE CLEANING JET

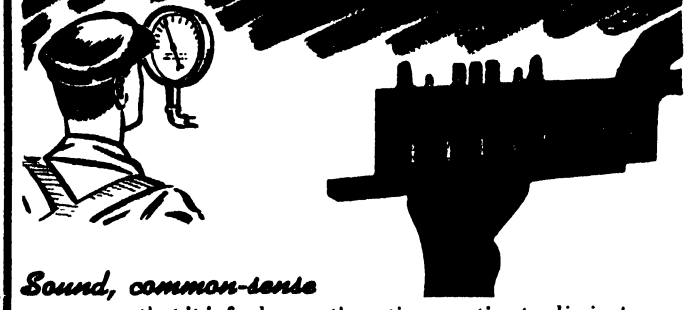
PARR INSTRUMENTS

ADIABATIC OXYGEN BOMB CALORIMETER



For determining the heat of combustion of any solid or liquid material that can be completely burned in an oxygen combustion bomb. This apparatus has been developed to meet all requirements for the highest precision in calorific measurements under industrial laboratory conditions. It is a compact and self-contained unit featuring a circulating water jacket, with provisions for adiabatic temperature control which eliminate all corrections for heat loss.

Write for new Bulletin E-60; or get your copy from any authorized dealer in Parr Apparatus.

BOTHERED WITH CORROSION AND SCALE?

Sound, common-sense proves that it is far less costly or time-wasting to *eliminate* a descaling job by controlling corrosion BEFORE IT STARTS! A shut-down, even temporary, of your steam-generating equipment at this urgent time can be avoided with a Taylor Boiler Water Comparator. It's easy to use . . . and you'll like the slide principle of color determination that assures positive, *accurate* readings. Elimination of even one descaling job more than pays its modest cost . . . and the famous Taylor UNLIMITED GUARANTEE against fading of color standards assures you of years of satisfactory use.

Write TODAY for 80-page booklet, "Modern pH and Chlorine Control . . . or see your dealer.

New York Philadelphia San Francisco London Paris

Physical and Chemical Methods of Sugar Analysis. *C. A. Browne* and *F. W. Zerban.* 3rd ed. 1353 pages. John Wiley & Sons, Inc., 440 Fourth Ave., New York, N. Y., 1941. Price, $15.

THE first edition of Browne's Handbook of Sugar Analysis, which appeared in 1912, and a later, slightly amplified edition filled a long-felt need in the English language. So much work has appeared in this field since the last publication of the old edition, which has been out of print for some time, that sugar chemists have been patiently and eagerly awaiting a new edition. The third edition, which bears the title, "Physical and Chemical Methods of Sugar Analysis", has been prepared under the joint authorship of C. A. Browne and F. W. Zerban.

Although this edition bears the same chapter titles as the old one, it is to a great extent a new book. This is particularly true of the six chapters on miscellaneous physical, qualitative, reduction, and special quantitative methods, the analysis of sugar mixtures, and selected methods for miscellaneous carbohydrate products. Treatment of these subjects has increased from 217 pages in the old edition to 687 pages in the new one. The earlier chapters on sampling, determination of moisture and dry substance, use of the refractometer, and polarimetric instruments and methods have grown from 306 to 496 pages.

With commendable scholarship and thoroughness the authors have covered the many new developments in apparatus and methods. The new immersion sugar refractometers, for example, and various double-polarization methods, including the two-enzyme method of Paine and Balch and the double-acid method of Zisch of particular interest to beet sugar chemists, are fully described. In the complexity of reducing sugar methods the authors might have been more drastic in rejecting some of the older, little used methods, but they have at least left enough to suit, if not bewilder, the most curious user.

Various physical methods for evaluating the quality of sugar factory products are treated amply. Included are methods of determining color, turbidity, and specific conductance of sugar solutions, besides many specialized means.

In all the new material the authors have done justice to the work of American as well as foreign investigators. The reviewer agrees with some regret that the authors have done wisely in eliminating the 261 pages of Part II of the old edition relating to properties of sugars. They could make suitable amends by preparing a new text on this subject, and it is hoped they will do so.

The appendix of 38 tables shows judicious selection. All new tables of importance seem to be included, although the authors state that they have necessarily been bound by limitations of space.

The reader who knows exactly what he is looking for will find it in the well-prepared index. The searcher for information on a general subject will have more difficulty in orienting himself in a work of such encyclopedic dimensions. An amplified table of contents, with section and subsection titles, would improve the usefulness of the book in this respect.

The book is printed in large easily read type, and the make-up is attractive. Since thinner paper has been used than in the old edition, the volume is not excessively bulky for its size. Although the price of the book, which is not disproportionate to its size, however, may prevent wide circulation, the new edition will be found indispensable to every sugar chemist.

S. J. OSBORN

Thermochemical Calculations. *Ralph R. Wenner.* 1st ed. 384 pages. McGraw-Hill Book Co., Inc., 330 West 42nd St., New York, N. Y., 1941. Price, $4.00.

THE usual textbooks on thermodynamics are concerned primarily with development of a pure science of highly mathematical nature and pay scant attention to practical applications of the formulas developed. Conversely, books on industrial and engineering phases of chemistry deal ordinarily with a maze of specific data and have little regard for the theoretical background underlying the equations employed. Both of these viewpoints have merit, but clearly they need cross connection to supplement each other. "Thermochemical Calculations" bridges this gap in a more than adequate fashion.

The first part of the book is devoted to thermochemical principles with only enough simplified problems to illustrate use of the equations developed. Relationships among the thermodynamic functions, such as heat capacity, enthalpy, free energy, entropy, etc., and their variations with pressure and temperature are logically developed for gases, liquids, solids, solutions, and chemical reactions.

Estimation of thermochemical data by theoretical and semiempirical methods receives particular attention. Among the former is an exceptionally lucid discussion of the meaning and utility of partition functions. The semiempirical methods consist mainly of a set of rules for estimation of entropies and heat capacities based on structure.

The second part of the book applies various principles developed earlier to a wide variety of industrial problems, such as solubility calculations, potentiometry, reaction possibilities, flame temperatures, apparatus design, air conditioning, gas liquefaction, and various phases of fluid flow. The author performs adequately the rather difficult feat of approaching these problems from the viewpoint of the large number of average chemists who are frequently confronted with them rather than of the professional physical chemist.

Make-up of the book is worthy of special mention. Chapter, section, and page numbers are readily found. Equation numbering is fitted into the general pattern in such a manner that cross references are easily located. Even in literature references, which are profuse and up to date, the page is given in cases where it is likely to be helpful.

"Thermochemical Calculations" is definitely a "must" book for technologists confronted with the solution of practical chemical problems.

E. H. SMOKER

Elements of Engineering Thermodynamics. *James A. Moyer, James P. Calderwood,* and *Andrey A. Potter.* 6th ed., rewritten. xiv + 217 pages, 14.5 × 23 cm. John Wiley & Sons, Inc., 440 Fourth Ave., New York, N. Y., 1941. Price, $2.50.

THIS revision of a well-known and widely used text on engineering thermodynamics follows the pattern of earlier editions. It is slanted for use in technical colleges giving special courses in engineering thermodynamics as well as steam turbines, internal combustion engines, heating, refrigeration, and other applications of thermodynamics.

New material includes treatment of uniform flow processes and new vapor tables. A uniform flow process is defined as one in which the working medium flows uniformly into the process and leaves in a similar manner. The authors adopt the usual engineering tradition of developing their theory on the basis of properties of the perfect gas and the Carnot cycle. Numerous typical cycles in various applications to engines, refrigeration, compression, steam jets, etc., are given and these are in most cases illustrated by pressure *vs.* temperature, temperature *vs.* entropy, heat content or enthalpy *vs.* entropy, and pressure *vs.* volume diagrams. Steam tables, a double-page insert showing the Mollier Chart for steam, and a psychrometric chart are given.

Numerous problems illustrate the text, and solutions of many problems are given in full. The notation and methods are strictly those of the mechanical engineer. Although the mercury vapor cycle is discussed, thermodynamics of air and hydrocarbon liquefaction, solid carbon dioxide manufacture, or organic vapor heating systems are not treated. The reviewer regrets that so large a gulf remains between the thermodynamics of the chemist and of the engineer.

MERLE RANDALL

Organic Analytical Reagents. *John H. Yoe* and *Landon A. Sarver*. ix + 339 pages, 14.5 × 22.5 cm. John Wiley & Sons, Inc., 440 Fourth Ave., New York, N. Y., 1941. Price, $4.00.

ORGANIC ANALYTICAL REAGENTS was written with a fourfold purpose: (1) "to assemble the literature on organic analytical reagents, (2) to discuss the theoretical aspects of the subject, (3) to furnish an up-to-date and reasonably complete bibliography on organic analytical reagents, and (4) to suggest further research in this important field of analytical chemistry".

After a brief introduction the first part of the book (Chapter II) classifies reagents. The remainder of Part I is concerned with a more detailed discussion of the reagents classified in Chapter II. The subjects considered are organic solvents and wash liquids, organic acids and bases, oxidizing and reducing agents, indicators (hydrogen-ion, redox, and adsorption indicators), primary standards in volumetric analysis, valence and complex compounds, the salinogenic reagents, photometric aids, and miscellaneous organic reagents.

Part II includes a list of organic reagents employed for detection or determination of various elements; the reagents are classified alphabetically under the elements. Following this most valuable table is a glossary of reagents arranged alphabetically containing references to literature citations which are given in a bibliography following the glossary.

Today, as America's industrial might swings into action, the greatest race in the history of this nation is taking place . . . the race against TIME. And all along America's vast industrial front, vital operations are being done better—*faster*—by means of Beckman pH Control.

. . . in the electro-plating of armament, tank, and automobile parts-and other metal goods-many operators using Beckman pH Control are now able to plate faster, at higher current densities, with fewer rejects than ever before!

. . . in dozens of different chemical operations, production speed has been stepped up—*and waste has been greatly reduced*—through Beckman pH Control!

. . . on the food front, also, Beckman pH Control is doing its job. In major sugar factories, for example, a better grade of sugar is now being produced—faster—and with reduced lime costs, through Beckman pH Control!

There is scarcely a major industry where Beckman pH Control cannot help in some way to turn out a better product, faster, at lower production costs. If you use water or water solutions anywhere in your plant—in chemical processes, in waste disposal, in boiler feed—*anywhere*—investigate today what Beckman pH Equipment can do for YOU. At no obligation our experienced research staff will be glad to study your problem and make recommendations.

AMERICA'S MOST ADVANCED pH EQUIPMENT!

No other make or type of pH equipment available today offers as many far-reaching advancements as BECKMAN • It is the only glass electrode pH equipment that can be used for continuous operation on boiling liquids • It is the only glass electrode pH equipment that can be used in highly alkaline solutions, even in the presence of sodium ions • It is the only glass electrode pH equipment providing a multiple electrode switch, by means of which an accurate pH record of as many as SIX electrode stations can be maintained—*automatically and continuously*—by ONE pH instrument. These are only a few of the outstanding pH developments available in Beckman equipment exclusively!

Illustrated at left is the Beckman Automatic pH Indicator used extensively for large-scale process control. Operates continuously and automatically from 115 V A.C. mains (no batteries) and operates standard recording and control equipment. Ask for Bulletin 161

Send for this booklet "What Every Executive Should Know About pH." Gives the basic story of modern pH control in simple, straightforward way. It's free.

NATIONAL TECHNICAL LABORATORIES, South Pasadena, California

Beckman THE LEADING NAME IN pH

Twenty-four hundred and nineteen references are listed in the bibliography which covers the literature up to July 1940. If the book contained only Part II it would be a valuable addition to the literature of analytical chemistry.

The authors have achieved the purposes set forth above in an entirely satisfactory manner. The formulation of the various organic substances is clear, and well-arranged structural formulas are used freely. This book will be welcomed by all chemists and should be available in every chemical library.

NATHAN L. DRAKE

The Industrial Chemistry of the Fats and Waxes. *T. P. Hilditch* (of Liverpool). 532 pages. D. Van Nostrand & Co., Inc., 250 Fourth Ave., New York, N. Y., 1941. Price. $7.50.

THIS book is a rather complete and enlarged revision of the first edition, and follows the original in arrangement of material, being divided into nine sections, each with several chapters and a fairly complete bibliography. This bibliography does not seem to cover fully American material, containing in particular few references to oil and soap, in which much of American material appears. The author also does not mention "Mechanical Pressing of Cottonseed" by Woolrich and Carpenter, a very good book. The book sections cover the chemical nature of fats, their composition, methods of preparation of both fats and glycerol, and the uses of the fats in edible and inedible fields, the latter including soap, candles, paints, varnishes, and lubricants, and also in the textile industry. The fields are very well covered in general.

There are a few errors, from American practice.

On page 195, Hilditch mentions "bulk" shipments of palm oil "in some instances". Nearly all of our palm oil is received in steamers' deep tanks in bulk.

On page 196, cottonseed is not "oil rich" according to Hilditch's definition as it contains 15 to 22 per cent of oil. The kernels or meats, however, contain 35 to 40 per cent.

On page 198, *all* American cottonseed is dried by hot air currents as received in the mills to reduce the moisture content to 10 per cent or below and prevent heating and decomposition.

On page 203, we "cook" meats with temperatures of 210° to 240° in ordinary cookers and in pressure cookers at higher temperatures.

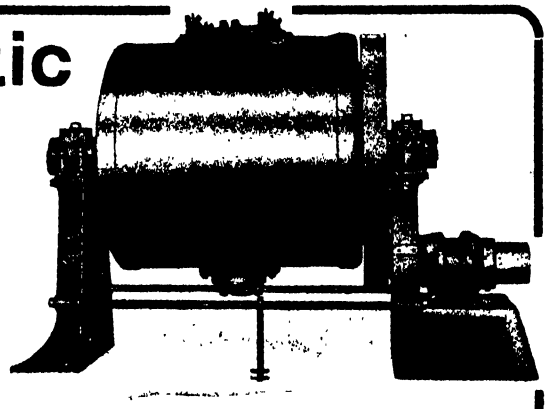
On page 224, he mentions Tonsil which is not used very much here. Filtrol, an American activated earth, is used, but our practice is to use ordinary clays and in much smaller percentages than he mentions, as 1 or 2 per cent is sufficient for nearly all oils. Also activated carbon we use in very small percentages, such as 0.1 to 0.3 per cent, but mixed with 0.5 to 1 per cent of fuller's earth.

On page 232, we use 28° Bé. caustic rather seldom in plant refining, our lyes usually running from 8 to 12 per cent NaOH.

On page 235, he makes no mention of the sale of soapstock in tankcars, whereas here nearly all of it is thus handled (using oil of cassia to prevent fermentation).

On page 236, he neglects to mention the necessity of completing saponification before distillation. It is possible to distill fatty acids only, and neutral oil (one third of the original soapstock fat) would be a total loss in this process as it would remain in the pitch. He also does not discuss "flash" or continuous stills here, although he mentions them on pages 239 and 240 for the deacidification of oils. We use them for distilling fatty acids, and obtain yields which run as high as 97 per cent as compared to 90 to 92 on batch stills. Owing to the short period of heating the acids, the products are much better, and there is very little increase in the amount of unsaponifiable produced by decomposition, whereas distillate from batch stills increase in unsaponifiable from 2 per cent at the beginning of a run to 10 or even 14 per cent at the finish. Also by tapping the various plates of the still, particular fatty acids in fairly pure forms can be obtained, such as products containing about 90 per cent myristic acid, etc.

On page 267, he discusses using completely hydrogenated fat and liquid oils to make shortenings, etc. This process was used here 15 years ago but was not satisfactory, and nearly all of our shortenings now are made by partially hydrogenating the total quantity of fat.



The Kreis test for rancidity discussed on page 325, is very capricious, as was reported by the A. C. S. Fat Analysis Committee several years ago. He also makes no mention of "stability" tests of oils by such methods as the Swift stability method. In these tests, it can be determined in eight hours whether an oil has any tendency towards rancidity. There are numerous papers on this by Irwin, King, Freyer, Wheeler, etc.

On page 316 he discusses "Fats for Frying" as something new. We have sold "cooking" oils, deodorized straight cottonseed, and other oils for this purpose for 40 years. Our other type of cottonseed oil, which is also sold in large quantities, is "salad oil", a "winterized" oil made by refrigerating and pressing cottonseed oil, etc., and used for mayonnaise and salad dressings.

On page 493, he discusses "Synourinol", a dehydrated castor oil, as if it were a laboratory curiosity. The process of dehydrating castor oil and making drying oils from it has been in commercial use here for several years.

Automatic Control

in GRINDING AND MIXING means

SAVINGS IN PRODUCTION!

Paul O. Abbé Ball and Pebble Mills provide complete fine grinding and mixing in a single operation . . . Control is so completely automatic that no attention whatever is required while Mills are working and no skilled labor is needed at any time.

"All Steel" cylinders give added strength, greater capacity and are air-tight, leakproof and dustproof.

A wide range of types and sizes allows for dry and wet grinding in capacities from 1/8 gallon to 1500 gallons. Pebble Mills are lined with Porcelain or Burr Stone. Ball Mills are equipped with Chrome-Manganese and other alloy steel shells.

Illustrated is one of the latest Paul O. Abbé "All Steel" Mills with Compact Motor Drive. *Write for complete catalog.*

PAUL O. ABBÉ
249 CENTER AVE.

LITTLE FALLS, NEW JERSEY

In general, however, the book is well written and should be a valuable reference book for chemists working with fats and those who use fats or fatty products. The book is well arranged and printed, the type is clear, and the presswork and binding are good.

Nutritional Charts

THE 10th edition of "Nutritional Charts", published by H. J. Heinz Co., is a brochure of tables and descriptive literature on the nutritive values of foods. In the new edition information on unsaturated fatty acids and inositol and on the newer members of the vitamin family has been included. New additions cover quantitative data on the nicotinic acid content of foods, application of the science of nutrition to dietetics, human nutritional requirements as recommended recently by the Committee on Nutrition of the National Research Council, and minimum daily needs of vitamins and minerals as given by the U. S. Food and Drug Administration in the tentative regulations for the labeling of foods represented to have special dietary uses.

The publication has been done under supervision of E. R. Harding, head of the Heinz investigational work at Mellon Institute of Industrial Research, assisted by L. L. Lachat. Copies are available free of charge from Mellon Institute, Pittsburgh, Penna., to all bromatologists, nutritionists, and other specialists who request them.

Metallic Alloys Review

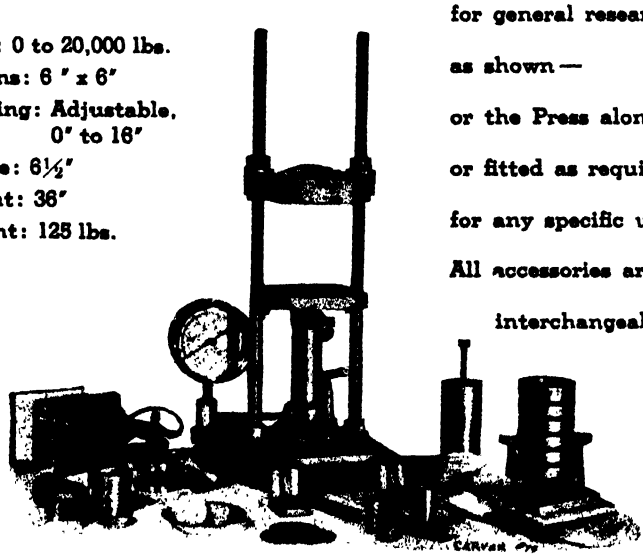
WORKING on metallic alloys at the University of Oxford for more than 15 years, W. Hume-Rothery has published reports of his research in more than 30 papers. Dr. Hume-Rothery has written a concise 20-page review of the work setting out the plan, aims, and main conclusions. A list of published papers giving detailed results is included. Entitled "Researches on the Structure of Alloys", the bulletin is published by the British Non-Ferrous Metals Research Association as Research Report R. R. A. 562 (June 1941). Copies may be obtained from the association, Euston Street, London, N. W. 1, England, at 2s.6d. (or 50 cents) post free.

New Safety Measures Planned for Blackout

The invisible rays from ultraviolet lamps light this display of new implements for blackouts. Dr. Hibben demonstrates the visibility curve of fluorescent chemicals.

A NEW type of blackout in which camouflage, lights, and fluorescent chemicals will play an important part in protecting vital seaboard cities was discussed by S. G. Hibben, Westinghouse wartime lighting expert before 2,000 state officials, air raid wardens, firemen, police, and FBI men at Bridgeport, Conn. He described the eight months of research on the problem of blacking out strategic objectives within a city rather than the whole city.

Hydrants, sidewalks, curbs, bomb shelters, motor cars, and clothing can be marked with fluorescent and phosphorescent chemical paints which glow brilliantly when irradiated by invisible ultraviolet rays. London's blackout is created by permanent shields and low wattage lamps which will have to remain for the duration of the war. The American blackout will be controlled from power stations and by police and civilian patrols. Thus cities suffering only infrequent raids will be able to return to normal lighting almost instantly after a raid.



By use of camouflage lights, engineers will be able to build decoy airfields, bridges, and other faked military objectives in deserted areas. The illusion of an important bridge span might easily be created by stringing rows of lights across a river in some isolated section. A well-lighted empty meadow several miles from a city could pose as an airfield if the city itself were not completely darkened.

Military experts expect American coastal cities to be susceptible to small but powerful "hit and run" air raids. United States plans are aimed at guarding against swift raids which would attempt to cripple specific life lines of a city, instead of spreading bombs at random.

THE CARVER LABORATORY PRESS

Furnished as a complete unit with all the standard accessories for general research, as shown — or the Press alone, or fitted as required for any specific use. All accessories are interchangeable.

Load: 0 to 20,000 lbs.
Platens: 6" x 6"
Opening: Adjustable, 0" to 16"
Stroke: 6½"
Height: 36"
Weight: 125 lbs.

Send for a complete catalog and prices.

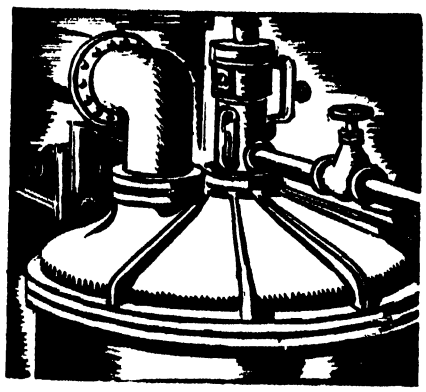
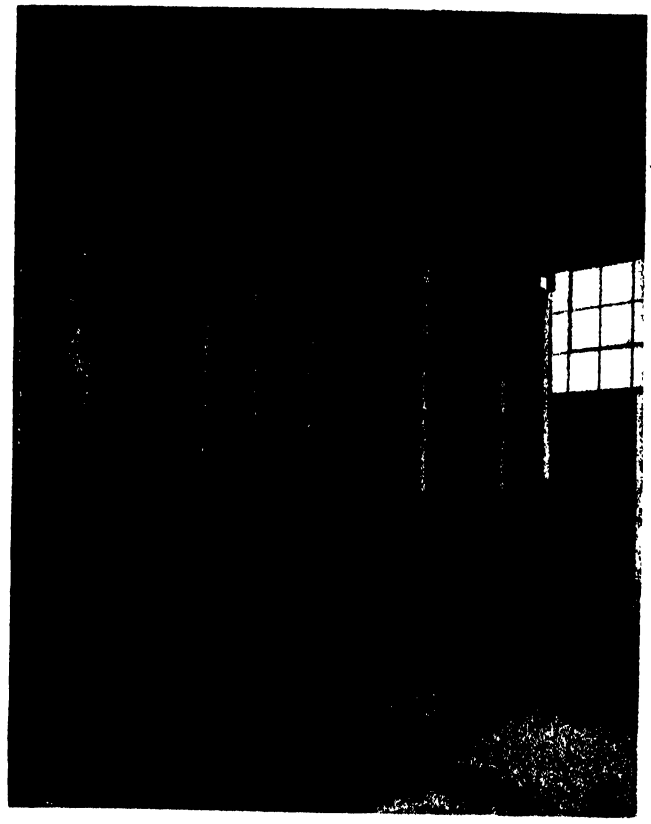
Industrial Uses of Platinum



RAPID growth in industrial use of platinum metals was the outstanding feature of 1941, said Charles Engelhard, president of Baker & Co., Inc., in reviewing the platinum metals industry for the year. More platinum metals are used now in industrial products and equipment than in jewelry, formerly of prime importance in platinum consumption. Mr. Engelhard pointed out that the Allied nations practically have both the world's sources and supply of platinum metals at their disposal.



Platinum is used as a catalyst in producing nitric acid and much of the contact sulfuric acid, he said. Palladium is employed increasingly as a catalyst in hydrogenation of organic compounds. Glass wool fiber is made from molten glass passed through small orifices in platinum alloy feeder dies. In rayon fiber production, the viscous solution is extruded under pressure into an acid bath through platinum metal alloy spinnerets.

In making electrochemical products, such as potassium perchlorate and persulfuric acid, exposed surfaces of insoluble anodes are of platinum. The new platinum-clad metals in such forms as tubing and sheet are being used in electrochemical processes and adopted elsewhere in the chemical industries for heat exchangers and similar apparatus, Mr. Engelhard explained. Electrical contacts of platinum metal alloys are required in electrical instruments and equipment of the Nation's fighting forces and huge industrial efforts. Numerous thermocouples of platinum or platinum-rhodium alloy are used in temperature control and other instruments.

For dental purposes consumption of platinum and palladium as alloying elements with gold gained markedly. In jewelry ruthenium-platinum alloys are replacing iridium-platinum alloys because iridium is being conserved for war work under an OPM order.

With the exception of iridium, prices for the platinum metals remained practically unchanged during 1941. Iridium, quoted at $275 per ounce at the beginning of the year, dropped to $175 an ounce in February and remained at approximately that figure during the rest of 1941.

This National Foam System installation stands guard in a large industrial plant. Operated by one man, it supplies 10,000 gallons of foam per minute.

A PLANNED FIRETRAP!

National sets the trap—carefully and scientifically. For National studies your fire-protection requirements...determines how and where fire will strike . . . what type of fire it will be . . . and how you can strike back effectively and economically!

All this falls within the scope of National's engineering and laboratory service!

Regardless of your hazard, National has achieved a fire-fighting record with it! We shall gladly make recommendations without obligation to you.

The Only Chemical Foam That Can Extinguish Polar Organic-Solvent Fires!

Alcohol, ether, ketones, esters and mixed polar solvents immediately break down ordinary foam bubbles. *Yet they can't touch National "99".* Every test has shown that! Listed by the Underwriters' and Factory Mutual Laboratories, National "99" is an exclusive National development!

SARGENT
BOTTLE INCLINATOR

A Convenient Method for Dispensing Acids

The swinging carriage accommodates either original acid bottles from cases or general 5 pint reagent supply bottles not exceeding 5⅛ inches in diameter or 13½ inches in height. A handle located at the base of the carriage permits accurate tilting of the bottle with one hand. Constructed entirely of metal. Overall dimensions: width, 7⅛ inches; depth, 8¼ inches; height, 15½ inches.

Because aluminum alloy sheets are proof against expansion and contraction, tools can be built up directly on them without trahscribing and measuring. Toolmakers simply fit the attachments to lines on the photoprint made with the giant camera.

Robot Draftsman

Most prolific defense worker, the Glenn L. Martin Co.'s robot draftsman, has acquired a twin. In the form of the world's largest camera, covering two rooms, the older unit has turned out around 750,000 man-hours of work in the last year—in effect adding 307 able technicians, almost impossible to find otherwise in these times. The new robot will double the figure for the aircraft company.

Developed over the past four years and representing the first successful application of photography to drafting, the Martin photographic reproduction process takes loft layouts in full scale and projects them back on sensitized surfaces of metal, wood, cloth, paper, and a variety of other materials. The system allows instant changes of scale, from full-size to scale-model size for wind-tunnel and towing-basin operations.

Saving untold hours of time that otherwise might be spent in redrafting, the process has expedited shop work since reproductions on metal form the actual base of jigs and fixtures in which airplane parts are assembled. It has aided the diemakers, who may work directly from the lines on their metal, instead of laboriously scribing the patterns. It has abetted the diecasters, who no longer have to use shrink scales because the camera can enlarge the drawing just the proper amount to allow for shrinkage of the cooling metal. Experimental workers find they can cut out whole pieces of a new airplane by simply sawing along the lines photographed onto bare metal. Similarly pieces of mock-up (full-scale wood models of the projected plane) can be cut along lines reproduced directly on wood surfaces.

Two rooms make up the camera itself. The bellows of the photo unit projects through the connecting wall, and a variety of lenses, the largest with a prodigious 70-inch focal length, are used. In the room before the lens, a huge copy board, suspended from an electrically-powered, remotely controlled overhead carriage, travels back and forth according to the size of the image to be reproduced. The original drawing on coated metal is placed against the copy board and held there by strong suction through holes in the board. The negative is placed in a rack on another traveling carriage in the other room. A powerful light travels across the copy board, giving even illumination to lines of the drawing. The exposed negative is developed and put back in the rack, while the original drawing is removed from the copy board and replaced by a sensitized sheet of coated metal in exactly the same position. Another mercury vapor light on the traveling carriage behind the negative projects the image back through the camera onto the sensitized sheet. For the largest layouts, all of the two rooms become the camera itself.

The exposed sheet is developed by progressive immersion in four stainless-steel tanks, each containing 100 gallons of liquid. With developer, short stop, hypo and running-water wash, the process is like that of any photographic darkroom, but on a heroic scale.

CHEMISTRY AND TECHNOLOGY OF RUBBER

Edited by: C. C. Davis and John T. Blake

NOTE: The prospect of a severe and long-continued shortage of rubber makes it more necessary than ever for the industrial consumers of rubber to understand its properties. Such knowledge will greatly aid them in determining what substitute materials can be used to greatest advantage.

This book is designed for all those connected with the rubber industry, whether research workers, analysts, compounders or development engineers. It is an authoritative reference work for both the theorist and the practical man.

Outside the rubber industry, this Monograph will prove invaluable to students, and to research and development men in numerous industries which supply raw materials for the manufacture of rubber goods. Engineers in the petroleum and chemical industries, on whom the responsibility of stepping up synthetic rubber production will now fall, will be greatly helped by the chapters on the physics of rubber and on substitute rubbers. Finally, this book will be useful to large-scale consumers of rubber: to textile plants, which now employ latex extensively; to the footwear and clothing industries; to automotive and other mechanical engineers; and to industrial maintenance engineers everywhere, who have become dependent on mechanical rubber goods for factory and field installations.

STEAM JET EVACTORS

AIDING NATIONAL DEFENSE

Numerous Croll-Reynolds Evactors are working overtime maintaining high vacuum in plants making explosives, synthetic rubber, airplane lubricants and a long list of other ordnance materials. They are maintaining high vacuum on engines and turbines of dozens of American ships sailing the seven seas.

While the large and special units require up to three months or more for fabrication the smaller ones are sometimes made in two weeks, or less, when the demand is urgent. These include single and multi-stage units for vacuum up to a small fraction of 1 mm. absolute, also small condensers and vacuum chilling equipment.

A recent development is a vacuum-cooled condenser for maintaining condensing temperatures down to 34° F. Inquiries will be handled as promptly as possible under the circumstances.

Lee Rubber & Tire Corp.	$981,887	$1,482,954	3.66	6.14
West Virginia Pulp & Paper Co.	3,670,621	4,270,312	3.03	3.70

The **Dow Chemical Co.** and subsidiaries for the six months ended November 30, 1941, reported consolidated net income of $4,052,370 which, after providing for dividends on outstanding preferred stock, was equivalent to $3.12 per share on common. This was after providing $3,139,206 for federal normal income taxes, surtaxes, and excess profits taxes, and including dividends of $750,000 from an associated company. For the preceding year net income was $3,585,015 or $3.02 per common share. The cost of completed emergency plant facilities, $1,226,067, is being amortized over a period of 60 months.

The **Firestone Tire & Rubber Corp.** reports sales 43.3 per cent over a year ago, a record high, for the year ended October 31, 1941. Provision for federal, state, and foreign income taxes amounted to $14,262,604, compared to $3,824,056 for the previous year. During the year the company refunded $44,600,000 in outstanding 3.5 per cent debentures maturing in seven years with a $50,000,000 issue of 3 per cent debentures maturing in 20 years. During the year the company's new plants in Brazil and India and factories in England, Canada, South Africa, and Argentina operated at capacity. Total investment in foreign countries now amounts to $36,003,447, including plantations in Liberia. Early in 1942 production of synthetic rubber is expected to begin in the new plant, later to be increased to 10,000 long tons annually. New buildings are being erected to increase facilities for manufacturing products needed by the Army, Navy, and air forces.

Plastic Spools for Textile Industry

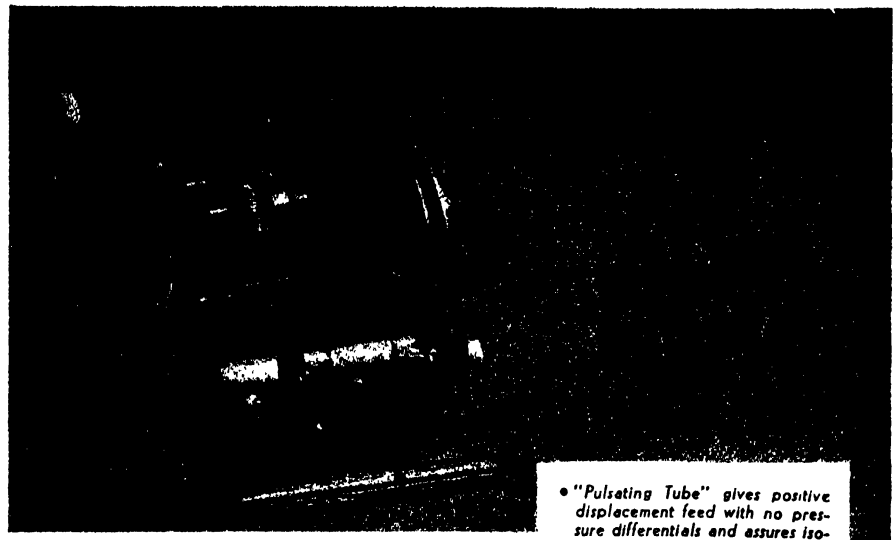
Plastics latest contribution to the textile industry is a molded spool for seaming thread used in hosiery and sewing thread for apparel, shoe, and other industries. Uniform in size to the thousandth of an inch, the spools have advantages of aiding in uniform winding and eliminating any possibility of yarn breaks due to snagging. The plastic used is Resinox, produced by the Plastics Division of Monsanto, Springfield, Mass. Spools, Inc., Providence, makes the holders for Premium Thread Co.

Blackout Paints

THE development of a complete line of blackout and camouflage paints to meet the current war emergency has been announced by the Paint Division of the Pittsburgh Plate Glass Co., Pittsburgh, Penna. The paints are designed for domestic and commercial use in areas subject to possible air raids. They obscure interior illumination when applied to windows, skylights, and other glazed openings. The blackout and camouflage paints have been developed in four principal colors—black, smoke gray, earth drab, and neutral brick.

Agi-Mixer

THE Agi-mixer, a product of Eppenbach, Inc., Long Island City, N. Y., combines the turbine feature of the company's Homo-mixer with a paddle and scraper agitator arrangement. It is designed to give continuous mixing throughout various viscosity phases, as in the saponification of fatty acids. It will prevent coagulation of setting of the material around the base of the tank, especially during a cooling process.

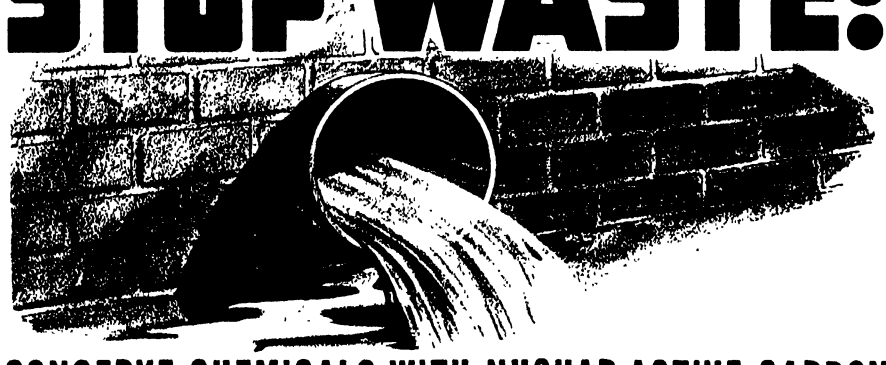


Bakelite C-9 Resins for the Paint and Varnish Industry. A new booklet describes the types of Bakelite C-9 resins developed for the production of heat-reactive and air-drying coatings, and indicates suggested applications. Emphasis is placed on their use with domestic oils, such as linseed, soybean, and dehydrated castor. This is an entirely new group of resins, supplementing the phenolic synthetic resins, and based on Carbic anhydride. *Booklet IE.* BAKELITE CORP., 30 East 42nd St., New York, N. Y.

Stainless-Clad Steel. A new 16-page price list for Silver-Ply stainless-clad steel contains base prices for sheets and plates for 12 grades of cladding, in proportionate thicknesses from 5 to 50 per cent. *Price List IE.* JESSOP STEEL CO., 534 Green St., Washington, Penna.

Stainless-Clad Head

One of 18 stainless-clad A. S. M. E. code flanged and dished heads, 1 5/16-inch minimum thickness by 72 inches in outside diameter. The heads were fabricated from Jessop Silver-Ply stainless-clad steel by American Locomotive Works for the du Pont company.



This Wilson "PULSAFEEDER"—known as Type DES—is recommended for concentrated H_2SO_4, Hypochlorites or any chemical feed application where a predetermined, manually set rate of flow is desirable.

The Chemical Pump is of the "Pulsating Tube" type, with all parts contacting the chemical solution constructed of materials that do not react to it. A standard electric motor of ample horsepower drives, by V-belt and pulleys, a combination gear reduction unit in a single, permanently lubricated case. Approximate capacities range from 0–1.2 to 0–75 G.P.H. *Ask for Bulletin DE-201.*

- *"Pulsating Tube" gives positive displacement feed with no pressure differentials and assures isolation of the solution being pumped from the permanent compression fluid.*

  Transparent plastic valves and blocks make operation visible.
- *Packing glands and mechanical diaphragms are eliminated to assure long life.*
- *Piston has low effective area and minimum power requirements.*
- *Micrometer feed stroke adjustment in operation assures precise, flexible control.*

STOP WASTE!

CONSERVE CHEMICALS WITH NUCHAR ACTIVE CARBON

In normal times, the Chemical Industry allows millions of dollars' worth of valuable chemicals to flow to the sewer because the cost of reclaiming them is too high to be considered.

However, with our war effort in full swing, there is an ever-growing shortage of chemicals; with even some of our most common heavy chemicals on the critical list. Therefore, it is becoming necessary to conserve chemicals and many chemical manufacturers are now finding it both practical and economical to reclaim acid, alkali, dye and other liquors by treatment with NUCHAR Active Carbon.

If the impurities can be removed by adsorption, the use of NUCHAR Active Carbon provides a simple, low-cost treatment. Investigate the possibilities of this treatment for the reclamation of your process liquors.

WHY BOTHER WITH GLASS OR METAL STOPCOCKS?

A NEW HANDY SIZE

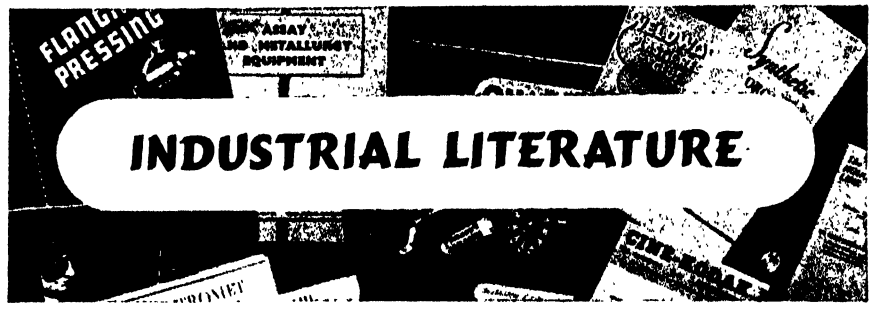
New Burrell "Industro" A40-700 4" x 9" x 13" — including metal carrying case.....$47.50

Here's something new in a portable flue gas analyzer — an apparatus without troublesome needle valves or fragile glass stopcocks! Instead, the Burrell "Industro" features the new flexible-rubber Ball Valve which will not stick or break.

American-Made

This American-made instrument, with its hard rubber reagent reservoirs, rigid valve housing, and easily-read, blue-line burette, represents the most modern idea of a light-weight, compact analyzer for the determination of carbon dioxide (CO_2), oxygen (O_2), and carbon monoxide (CO).

Plus These Extras



All necessary solutions as well as rubber aspirator bulb and complete, but simple, instructions go with each "Industro." There are no "extras" to add later. A wide choice of highly accurate, interchangeable burettes is provided The most popular has a capacity of 50 ml and indicates 21% in 0.2% divisions.

TECHNICAL SUPPLY CO.

1942 FIFTH AVE. PITTSBURGH, PA.

Listed publications should be requested directly from the company concerned. Use business stationery, mention bulletin numbers, and refer to this journal. Publications will be sent free unless otherwise noted.

Air Classifiers. A series of three illustrated bulletins describes cyclone-type air classifiers in plant and laboratory sizes. A series of photomicrographs illustrates the narrow limits of classification obtained with this equipment. *Bulletins 5, 25, and 26 IE.* FEDERAL CLASSIFIERS SYSTEMS, INC., 127 North Dearborn St., Chicago, Ill.

Air Conditioners. A leaflet covers the glass-filament capillary-cell type element, and several installations into which it is being built. Complete conditioner units are pictured. The cells are said to filter air while humidifying it. In certain cases the units may be used to absorb or condense chemical fumes or gases. *Capillary Air Conditioners Leaflet IE.* AIR REFRIGERATION CORP., 475 Fifth Ave., New York, N. Y.

Air-Conditioning Unit. This pamphlet discusses a system composed of a humidifying or dehumidifying unit and a solution reclaimer. A special liquid medium is used to convey moisture to or from the air, its moisture properties being governed by temperature. Air is said to be cleansed by the unit. *There's Trouble in the Air Pamphlet IE.* SURFACE COMBUSTION CORP., Toledo, Ohio.

Anodizing Aluminum. A 21-page booklet details the chromic acid process. The booklet suggests how anodic operations may be improved, consumption of chromic acid reduced, and a more uniform product obtained. Several charts and graphs, as well as a suggested tank design, are included. *Anodizing Aluminum by the Chromic Acid Process Booklet IE.* MUTUAL CHEMICAL CO. OF AMERICA, 270 Madison Ave., New York, N. Y.

Automatic Bearing Lubrication. Described in this 8-page bulletin is a centralized lubricating system which connects frequently lubricated bearings to a multiple injector unit. By either manual or time-clock operation each bearing is given its predetermined quantity of lubricant. *Form 167 IE.* THE FARVAL CORP., 3293 East 80th St., Cleveland, Ohio

Automatic Valves. A 124-page catalog discusses in detail the selection, installation, operation, and maintenance of pressure-reducing regulators, temperature regulators, pump governors, relief valves, and other valves. While all models are supplied for regulation of steam, some are supplied for air or certain liquids or gases. Copies will be sent to executives or engineers in defense industries, if their requests are written on their companies' letterheads. *Catalog 70 IE.* FOSTER ENGINEERING CO., 109 Monroe St., Newark, N. J.

Colloid Mills. This 4-page bulletin covers construction, operation, and applications of commercial size colloid mills. Dryers, kilns, crushers, pulverizers, conveyors, and other items of the manufacturer's line of process equipment are briefly described and illustrated. *Bulletin 93 IE.* THE C. O. BARTLETT & SNOW CO., 6400 Howard Ave., Cleveland, Ohio.

Comminuting Machine. A 4-page bulletin features a new machine capable of grinding and pulverizing or of slicing, chopping, or dicing. It meets the sanitary requirements of the food and pharmaceutical industries. The rotating blades are flat on one side for impact operations, and sharp on the other side for cutting. Direction of rotation is reversible. *Model D Comminuting Machine Bulletin IE.* W. J. FITZPATRICK CO., 111 North Canal St., Chicago, Ill.

Conductivity Instrument. This catalog sheet is written about a conductivity instrument that indicates solution concentration, operates warning signals, and controls corrective equipment. It is for use with many industrial solutions, water, or other liquids which must be maintained within certain concentration limits. *Form RE-103 IE.* INDUSTRIAL INSTRUMENTS INC., 156 Culver Ave., Jersey City, N. J.

Corrosion-Resistant Equipment. A new 8-page catalog gives descriptions of plastic-molded pipe, fittings, towers, hoods, tanks, and floor covering. A table lists the corrosion resistance obtainable. *Corrosion Resistant Chemical Equipment Catalog IE.* HAVEG CORP., 16 Chapel St., Newark, Del.

Dryers. This 10-page bulletin is devoted to a new continuous dryer for wet-solid and plastic materials. The equipment takes filtered or settled material to be dried, and automatically preforms it before it enters the dryer, by means of either an extruder, drum, or granulator feed. *Bulletin 100 IE.* PROCTER & SCHWARTZ, INC., Philadelphia, Penna.

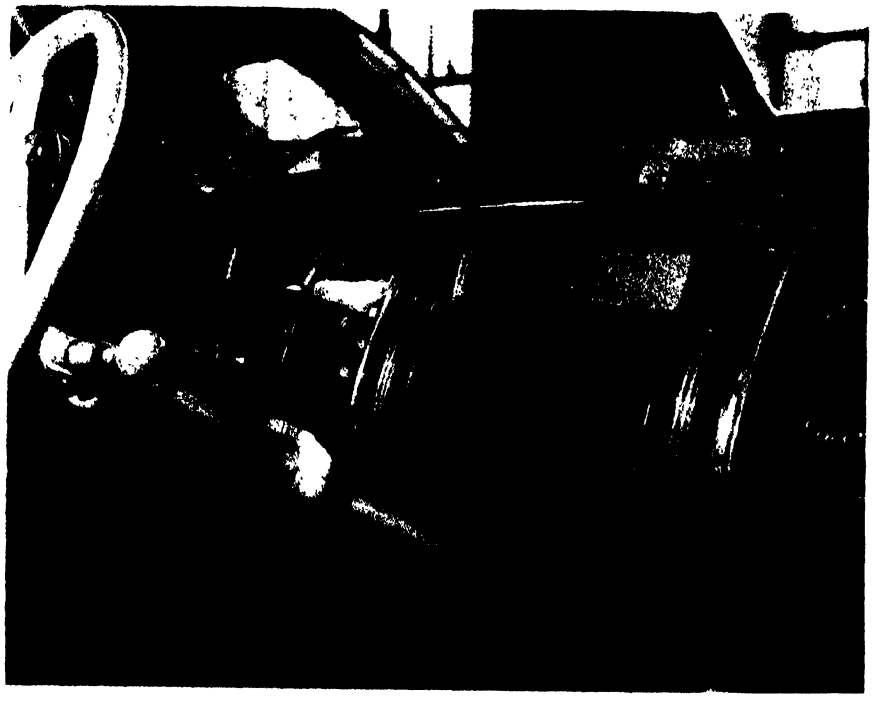
Fluorometric Assay of Vitamins B. A collection of five papers relates to methods and equipment for the fluorometric assay of vitamins B. *Bulletin T-108 IE.* COLEMAN ELECTRIC CO., INC., 310 Madison St., Maywood, Ill.

Frozen Water Ribbons. An 8-page bulletin explains the new form in which water-ice is being produced. This new form of water-ice has many features, such as lower temperature, dry surface, and better packing qualities, which are said to assure it a permanent place in the commercial ice field. Production equipment is illustrated. *Bulletin 39350-i IE.* York Ice Machinery Corp., York, Penna.

Glass-Lined and Stainless Tanks. This catalog of 24 pages describes a series of vertical and horizontal tanks for use in the food industry. Agitator and piping accessories are included. *Sani-I-Tanks Catalog IE.* Metal-Glass Products Co., Belding, Mich.

Government Specification Finishes. A file folder of data sheets gives widely used Army and Navy specification finishes. Each sheet contains sufficient information to enable a defense-goods manufacturer, not heretofore familiar with government specification finishes, to figure his unit costs accurately and establish the most efficient production schedule in keeping with his particular equipment. *Facts about U. S. Government Finishes. Data Sheets IE.* Roxalin Flexible Lacquer Co., Elizabeth, N. J.

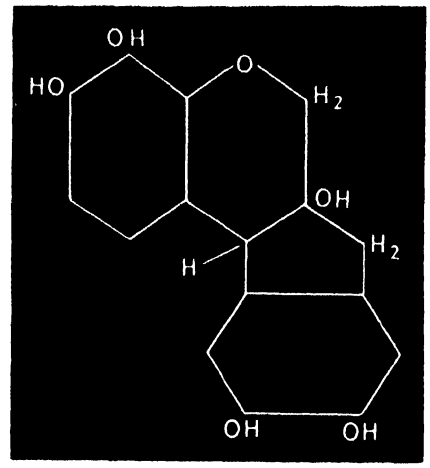
Heat Exchangers. This pamphlet covers a line of spiral-constructed heat exchangers. Several advantages are listed for the spiral construction. *The Spiral Heat Exchanger Pamphlet IE.* American Heat Reclaiming Corp., 1270 Sixth Ave., New York, N. Y.



Industrial Control Devices. This new 56-page catalog is virtually a treatise on automatic control. Forty-two electric and pneumatic controls are listed. Each instrument is fully illustrated and described. *Catalog 8301 IE.* The Brown Instrument Co., Philadelphia, Penna.

Industrial Products from Milk. A 21-page booklet points out uses for such products as casein, lactose, lactic acid, and lactates. A number of new applications are suggested. *Industrial Uses for Milk Booklet IE.* Sealtest, Inc., 230 Park Ave., New York, N. Y.

Isomerization Process for Isobutane An 8-page bulletin details a process for isomerizing butane catalytically to isobutane. A flow diagram is included Isobutane is an important intermediate in production of high-octane blending stock for aviation gasoline. The process is of fundamental importance for operating in conjunction with alkylation plants. *Bulletin 0-41-13 IE.* Foster Wheeler Corp., 165 Broadway, New York, N. Y.



Jar and Bottle Rolling Machines. This bulletin is devoted to laboratory- and production-type rolling machines for use in wet or dry grinding, pulverizing, and mixing small batches of solids. A table of dimensions, capacities, etc., is included. Also illustrated are two tumbling machines. *Bulletin 56 IE.* Abbe Engineering Co., 50 Church St., New York, N. Y.

Liquid Processing Equipment. This new 36-page catalog describes and pictures portable and stationery mixers, pressure filters, pumps, glass-coated tanks, bottle fillers, cappers, and labeling equipment. The new sealed disk-type pressure filters are said to have desirable speed and capacity characteristics for their size. Disks used are discardable. Varying degrees of filtration fineness are obtainable through selection of disks. *Catalog 941 IE.* Alsop Engineering Corp., Milldale, Conn.

Plastics in Auto Interiors

An example of the increasing use of plastics in car interiors is this radio grille dash section produced by the Bay Manufacturing Division, Electric Auto-Lite Co., from Resinox, made by Monsanto's Plastics Division, Springfield, Mass. This is one of the largest phenolic plastic molded sections ever used in the automotive field.

HEMATOXYLIN

TECHNICAL

Available for the first time in pilot plant quantities sufficient for research and development work.

PROPERTIES

PHYSICAL:—Light brown needles, odorless, sweet tasting, non-hygroscopic and easily recrystallized. M. P. —$3H_2O$ at about 140°C.

Solubility:

Water, 2.5% at 25°C. very soluble hot.

Lower Alcohols, very soluble.

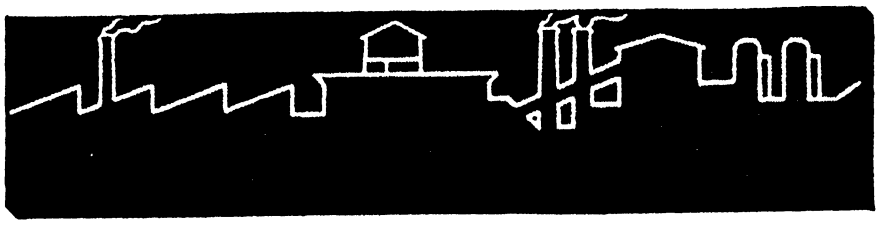
Ether, slightly soluble.

Hydrocarbons, insoluble.

CHEMICAL:

General; easily oxidized by air, especially in direct sunlight, to hematein ($C_{16}H_{12}O_6$).

pH indicator, changing from yellow to violet at about pH 6 on addition of alkali to solution.



Specific: typical phenol reactions such as methylation, acetylation and formation of salts with heavy metals.

SAMPLES and INFORMATION *upon request*

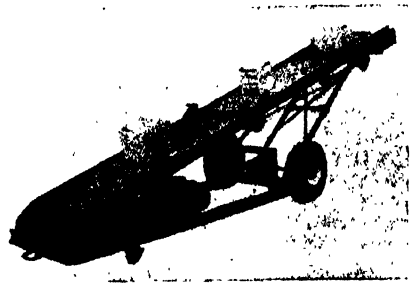
BELLEVILLE, N. J.

Water-Repellent Jackets for the Army

THE best made uniforms ever put on a soldier are being issued to the men in the United States Army.

An example is the Army jacket, worn both on and off the post. It is made of a cotton poplin, tightly woven, treated with a durable water-repellent such as du Pont Zelan at the textile mill, and lined with wool where added warmth is required. The poplin will not soak through except in driving rain, when waterproof coats are in order. Nongreasy spots may be sponged off with a damp cloth. The jacket serves as a wind-breaker yet, unlike leather or rubber coats, it allows the body to breathe.



Chemically-treated fabrics are being used by the Army for numerous purposes. The tank corps, parachute troops, and ski troops have special water-repellent and spot-resistant uniforms in addition to the regulation jackets. Caps and reversible tents are being treated with Zelan with satisfactory results.

Allen Laboratories Move

THE Allen Laboratories, Fine and Rare Chemicals Division of W. F. Straub & Co., announces its removal to larger quarters at 5520 Northwest Highway, Chicago. The new facilities with the old will greatly increase its capacity for research and production.

To mark the first year of the company's existence, a dinner was given December 19 at the Lake Shore Athletic Club.

Portable Belt Piler

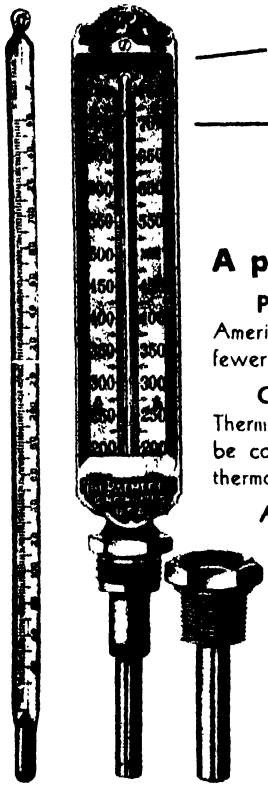
A REVERSIBLE portable belt piler with rubber tire wheels designed for piling, loading, and unloading box cars is announced by the Standard Conveyor Co., North St. Paul, Minn. The rubber tire wheels make it possible to move the machine from one site to another by simply hooking the lower end to a motor truck. Casters are rubber covered so that the piler moves easily. The carrier is raised and lowered by a crank on the side. This particular machine has a safe maximum piling height of 8 feet but it will pile up to 10 feet. The minimum piling height is 4 feet. It is also provided with a rough top belting to keep the commodities from slipping when set for the high elevation of 10 feet piling height.

Ten-Year Chevron for Pyrometers

ON JANUARY 2, 1932, a small group of people arrived in Foxboro, Mass., to become the nucleus of the Foxboro Pyrometer Department and carry on the production of a line of instruments begun under the name of Wilson-Maeulen Co. in 1907.

Through cooperation of the existing Foxboro organization and the old Wilson-Maeulen group, records, stock of parts, and machinery and furniture had been set up and production started almost immediately. With the department started in the midst of a depression which had several years to run, a lot of adjustments and adaptations had to be made by both the old and new personnel to attain harmony of cooperation.

On the 10th anniversary of the event, the company has a coordinated activity which has brought out a new potentiometer recorder, a potentiometer recording controller, and a group of potentiometer indicators. All the original designs have been completely replaced, with the exception of the nonrecording controller, which has been improved. New items have been added. This 10th year at Foxboro has seen the largest production in number of instruments and the largest dollar volume in this line since Charles H. Wilson began one of the pioneer American instrument businesses 33 years ago.



Microphotometer

A RAPID and convenient method for analyzing spectrographic plates or films is provided by a recording microphotometer announced by the Leeds & Northrup Co., 4934 Stenton Ave., Philadelphia, Penna. Because the plates or films are mechanically scanned by a motor-driven scanning unit, and the relative positions and densities of spectrum lines are automatically recorded, this microphotometer eliminates the eyestrain and "human equation" of visual methods, and does

A New STAR To Follow In 1942

ECONOMY!

A paramount issue of the Day

Palmer Thermometers, made with extreme care, by skilled American workmen, mean extra life to these instruments, and fewer repairs.

Careful annealing, which is a feature of every Palmer Thermometer, gives you a round dollar value, which should be considered before you sign your next order, for any thermometers.

And "Red-Reading-Mercury" . . . the easy to read RED column, costs you no extra. Buy thermometers that will give you real service.

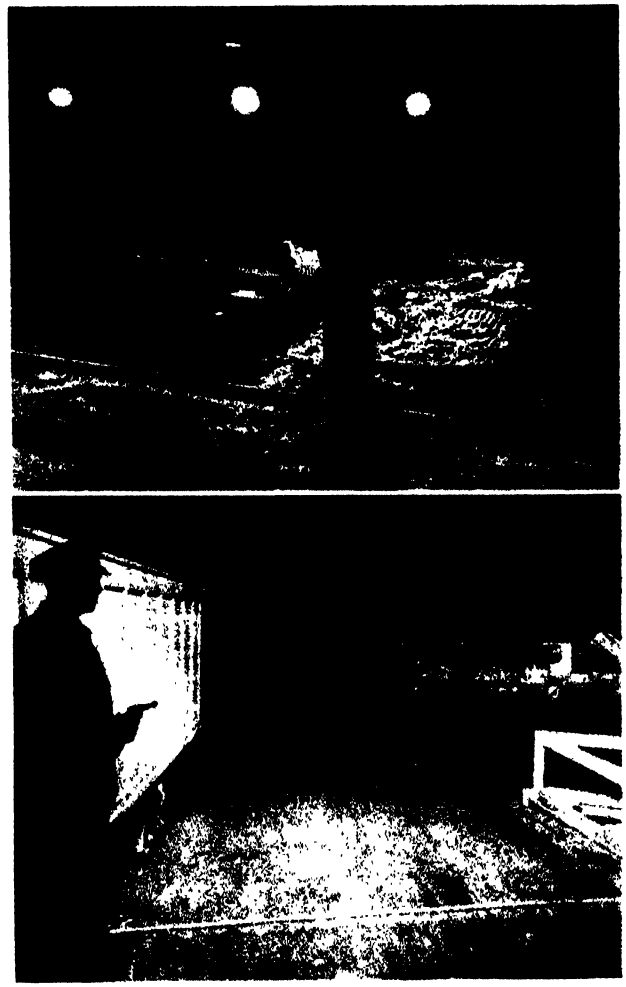
Canadian Plant: King and George Sts., Toronto

Mass Production of Nitrided Tank Parts

An unusual heat-treating operation is the mass production of nitrided tank tractor pins as carried out at the Campbell Wyant & Cannon Foundry Co., Muskegon, Mich. Loads of 12,000 pounds containing 10,000 track pins are being nitrided to a depth of 0.025 to 0.030 inch. Nitriding is carried on in two Lindberg cyclone nitriding furnaces, equipped with alloy retorts 38 inches in diameter and 54 inches deep. In the period of about six months since installation over 300,000 pins have been nitrided withou the loss of a single pin. Weekly output is around 20,000 pins.

Chemistry Courses Offered in ESMDT Program

THE Extension Services of The Pennsylvania State College are conducting a special course in the production, properties, and utilization of plastic material. The course includes lecture and laboratory work on all plastics of industrial importance. Classes meet from 7:00 to 10:30 P. M. two nights each week for 14 weeks.



The present course is being given in three different locations—Lancaster, Scranton, and Pittsburgh. Instructors are P. O. Powers assisted by L. H. Dunlap in Lancaster, S. L. Kaye in Scranton, and Roger Spencer in Pittsburgh. Organization and supervision of the course have been carried on by J. W. Richardson, Chemistry Extension Services, The Pennsylvania State College.

Nearly 100 students were enrolled for the courses. All have either a bachelor's degree in chemistry or considerable specialized experience to qualify for the work of the course, which is given under the current ESMDT program of the U. S. Office of Education.

The Extension Services of The Pennsylvania State College are also conducting ESMDT classes in Technical Analysis, Chemistry of Engineering Materials, and a basic course in Foundations of Engineering Chemistry. Over 1200 students were enrolled in 55 class centers. This program is under general supervision of Arthur Rose, A. W. Hutchison, S. C. Schuman, A. J. Currier, and J. C. Underwood of the resident Chemistry Department, The Pennsylvania State College.

Niacin as Synonym for Nicotinic Acid

THERE has been much popular objection to the enrichment of bread with nicotinic acid, the vitamin necessary to prevent pellagra, because of confusion with the poisonous alkaloid, nicotine. The recommendation of the Food and Nutrition Board of the National Research Council that "niacin" and "niacin amide" be adopted as synonyms for nicotinic acid and nicotinic acid amide has been accepted by the Federal Security Administrator as not inconsistent with requirements of the Food, Drug, and Cosmetic Act. The NRC committee was composed of C. A. Elvehjem, W. H. Sebrell, and Tom D. Spies. The committee also recommended that the terms "nicotinic acid" and "nicotinic acid amide" be used in scientific literature and that the new terms be used only where there may be objection from the public.

Protection by Glare

Glare, anathema of lighting engineers, is now welcomed as an ally in the present defense against the saboteur. Westinghouse engineers are using it to blind a would-be intruder to a war materials plant. A Fresnel lens throws a flat, fan-shaped beam of light. A row of these luminaires is set on posts several feet away from the buildings, aimed so light is projected slightly downward. The space between the luminaires and buildings is virtually in darkness. *Above.* What the would-be intruder sees of a plant protected by the lights. *Below.* What the guard sees.

EMPLOYMENT INFORMATION

RATES to be paid in advance. Standard setting 5c a word, minimum charge $2.00 each; include 8 words for box address. Exceptions see ⟶ Display, $7.50 per column inch. No discounts or allowances.

SEND advertisements with remittance to INDUSTRIAL AND ENGINEERING CHEMISTRY, 332 West 42nd St., New York, N. Y., to reach there not later than 10:00 A.M. on the 10th and 25th, closing dates for NEWS EDITIONS of the 25th and 10th, respectively. Insertions made in order of receipt provided necessary remittances are complete.

Employers are requested to mention in their announcements the section of the country in which the open position is located to ensure replies only from those who are geographically available.

In printing these advertisements the SOCIETY assumes no obligations as to qualifications of prospective employees or responsibility of employers.

Unemployed members of the AMERICAN CHEMICAL SOCIETY seeking employment for themselves are allowed in one calendar year 3 free announcements, one per issue, set in standard style and limited to 50 words each, including 8-word box address. Excess words 5c each. Additional standard announcements 50% of regular rate.

Employed members of the AMERICAN CHEMICAL SOCIETY seeking new positions are permitted 3 standard announcements during the calendar year at 50% of the regular rate—include 8 words for box address.

Employers seeking chemists and chemical engineers are permitted 3 standard announcements, not to exceed 50 words each including box address and not more than one per issue, during the calendar year without charge, provided they agree in writing to acknowledge all replies (excess words 5c each), otherwise full rate applies.

The AMERICAN CHEMICAL SOCIETY is vitally interested in the welfare of its members and in seeing that the chemical industry is manned with competent chemists and chemical engineers. These pages are part of our service in that connection. In addition most of the larger sections of the AMERICAN CHEMICAL SOCIETY and several of the smaller ones have active employment committees. Local section secretaries in your area will inform you as to any employment aids that may be available locally.

An Employment Clearinghouse is operated at each national meeting of the SOCIETY for the purpose of bringing together representatives of industry looking for chemists and members and student affiliates in attendance wishing to make such contacts. For further details, consult the preliminary and final programs as printed in the NEWS EDITION prior to each meeting.

In the New York area, special employment facilities are offered by the Employment Bureau of the Chemists' Club, 52 East 41st St., New York, N. Y., and by the Chemist Advisory Council, Inc., 60 East 42nd St., New York, N. Y. In the Chicago area, the Chicago Section maintains an employment service at 413 Stevens Hotel, Chicago, Ill.

Those replying to announcements should be careful to send copies and not original documents. Advertising circulars will not be forwarded and to that end all letters will be opened at the forwarding office.

SITUATIONS OPEN

Those announcements in which the letter "P" is part of the address key have paid in full and are not committed to acknowledge replies The Society regards acknowledgment by employers of all applications as an act of common courtesy but can assume no responsibility for their failure to do so.

ORGANIC RESEARCH chemist, Ph.D., under 30, with wide experience in synthetic organic chemistry for development of research department in large mid-west industry. Submit full details of education, experience and complete personal data. Include salary expected and recent photo.
Box 14-N-1, Ind. & Eng Chem., Easton, Pa.

WANTED BY large Eastern concern for immediate employment: Chemists or chemical engineers for research and development work in petroleum and polymer chemistry. Our own employees have been advised of this advertisement Replies will be treated in strictest confidence.
Box 22-N-1, Ind. & Eng. Chem., Easton, Pa.

POSITION TEACHING "General Chemistry," "Teaching of Chemistry," "History of Chemistry," in large, fully accredited, mid-western university. Success will be measured by teaching results, activity in Division of Chemical Education, effectiveness in contacting and leading secondary school science groups. Send full particulars in first letter.
Box 24-N-1, Ind. & Eng. Chem., Easton, Pa.

PLASTICS CHEMIST with good general knowledge of molding techniques and the properties of commercially available plastics to supervise their selection and use in a Western New York industry. Salary between $3000 and $4500 per year depending on training. Send personal data and photograph.
Box 10-TP-1, Ind. & Eng. Chem., Easton, Pa.

BIOCHEMIST with nutritional background and administrative ability to supervise large active bioassay laboratory. Should have Ph. D. or equivalent in experience. Opportunity for publication of research and attendance at scientific meetings. State full particulars including salary expected and enclose photograph. Replies held in strictest confidence.
Box 11-T 1, Ind. & Eng. Chem., Easton, Pa.

BIOCHEMIST Ph.D. with 2 or 3 years' experience. Must have good foundation in physical and organic chemistry, and capable of undertaking enzyme and vitamin research. Applicants should give educational history, scholastic grades, experience, age and other personal data, and recent photo Excellent opportunity for qualified person in research laboratory of prominent food organization.
Box 23-TP 1, Ind. & Eng. Chem., Easton, Pa.

RESEARCH CHEMIST wanted with actual working knowledge of formulation and production of synthetic resins, particularly of the phenolic type, to develop new thermo-setting resins from certain natural raw materials.
Box 28-T-1, Ind. & Eng. Chem., Easton, Pa.

RESEARCH CHEMIST

to conduct investigations for well known manufacturing organization for further development of its product for emergency use as well as for post war expansion. Ph D or other graduate training in chemical engineering and several years' chemical research experience in electroplating or electrochemistry preferred Northwestern Pennsylvania district. Send resume of experience including age, place of birth, education, earnings record, and salary desired
Box 33-TP-1, Ind. & Eng. Chem., Easton, Pa.

GOOD OPPORTUNITY for Chemist experienced in production or research on manufacture X-ray intensifying screens. Give complete details including education, personal history, experience, salary desired, references. Include small recent photograph. Location New York City.
Box 35-T-1, Ind. & Eng. Chem., Easton, Pa.

ENGINEERS. Several openings for capable mechanical or chemical engineers with old established engineering organization having a number of Defense projects. Prefer technical graduates with at least five years experience in the design of industrial and chemical plants. Reply by mail giving full details of personal qualifications, technical training, experience, references and salary. Include a recent photograph. E. B. Badger, & Sons Company, 75 Pitts St., Boston, Mass.

WOMAN CHEMIST, American born, wanted for literature work in a library connected with a petroleum research laboratory situated in the Chicago area. Applicant must be thoroughly grounded in organic and physical chemistry; and she should be able to read German and to type.
Box 44-TP-1, Ind. & Eng. Chem., Easton, Pa.

RESEARCH ASSISTANT fats, oils, surface active materials. B.S, with good training in organic chemistry. Industrial experience not necessary. Location New York area. State age, education and draft status.
Box 47-T-1, Ind. & Eng. Chem., Easton, Pa.

YOUNG B.S. or M.S. wanted for duration near Boston. B record in analytical and organic chemistry, knowledge of bio-chemistry desirable. Draft status immaterial. Must be citizen. State training with grades, extensive references, experience and age. Enclose photograph.
Box 48-T-1, Ind. & Eng. Chem., Easton, Pa.

PHARMACEUTICAL CHEMIST, university graduate, to take charge of Laboratory for Applied Research and Specialty Development wanted by large concern in New York area. Further information obtainable from Chemists' Club, Employment Bureau, 52 East 41st St., New York City. About ten years' practical experience in drug manufacturing is desirable. When applying, state training, experience and salary desired.
Box 50-TP-1, Ind. & Eng. Chem , Easton, Pa.

ORGANIC CHEMIST with about ten years' experience in drug manufacturing wanted by large pharmaceutical concern in New York area. Applicant should be capable of running his own and supervising other processes. Further information obtainable from Chemists' Club Employment Bureau, 52 East 41st Street, New York City. When applying, state experience and salary desired.
Box 51-TP-1, Ind. & Eng. Chem., Easton, Pa.

WANTED: Dyestuff Plant Foreman, age 35-45 yrs. Small plant, good opportunity, location Pennsylvania. State age, experience, education, salary expected, etc.
Box 54-TP-1, Ind. & Eng. Chem., Easton, Pa.

WANTED: GRADUATE Assistants in Chemistry for 1942-43 at $500 with free tuition, exemption from laboratory fees Must have physical chemistry, calculus and second year physics. Send for application blank to Dept. of Chemistry, University of Pittsburgh, Pittsburgh, Penna.

SITUATIONS WANTED
(A.C.S. MEMBERS)

SPECIAL LIBRARIES ASSOCIATION will recommend trained chemical and technical men and women librarians at no cost to employer or member. Competent persons are now available. Write to the Executive Office, 31 East Tenth Street, New York, New York, for additional information.

PHYSICAL CHEMIST, Ph.D., 1937. Nine years college teaching, general, analytical, physical. Research in electro organic and catalysis. Expert glassblower. Polarograph. Sigma Xi. Age 30, married. Research or teaching position desired in East.
Box 49-T-10, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, BIOCHEMIST, bacteriologist. A.B., 16 years' experience in foods, biological and bacteriological products, plant management including production, maintenance, personnel, and accounting. Successful research and sales records. Patent experience. Age 39, married, Protestant. Continental U. S. preferred.
Box 66-T-10, Ind. & Eng. Chem., Easton, Pa.

FOOD CHEMIST with over twenty years wide experience in the food industry, in direction, research, process development, quality control, and factory problems. Desires a responsible position.
Box 48-T-11, Ind. & Eng. Chem., Easton, Pa.

CHEMIST B.S. 1940. One year towards M.A., A.C.S. approved universities. Single, 23, draft deferred. Analytical, physical, crystal structure, and some organic research. Read French, German. Desire research, development, or position leading thereto. Far west preferred, but will consider anywhere. Available immediately.
Box 76-T-11, Ind. & Eng. Chem., Easton, Pa.

BIOCHEMIST Ph.D. 1924 with 17 years' experience in development and production of glandular and vitamin products. Special interest in development of new products and clinical ___ Desires position in either laboratory and plant development or promotion and sales. Available immediately.
Box 13-T-12, Ind & Eng. Chem., Easton, Pa.

PROFESSORSHIP Ph.D., Phi Beta Kappa, listed in Who's Who, Protestant. Experienced in teaching General, Organic, and Industrial Chemistry, also as industrial research laboratory director. Now employed, but interested in return to teaching because of opportunity for essential constructive work
Box 31-N-1, Ind. & Eng. Chem., Easton, Pa.

EXPERIENCED PHYSICAL Chemist, excellent scholastic standing, available for research position. Eleven years' successful research in gas reactions, hydrocarbon chemistry, catalysis. Many publications, patents. Author of books recognized as standard works in their respective fields. Married, 35. First papers obtained (British subject).
Box 32-N-1, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, ORGANIC, Ph.D. in 1942 from Eastern University. Available immediately. Research in enzyme chemistry and analytical organic. Publications. Broad background in major field including synthetic organic. Minor in physical and biochemistry. 4 years' experience in teaching organic and inorganic. Eastern location preferred but not essential.
Box 36-N-1, Ind. & Eng. Chem., Easton, Pa.

(Continued on page 155)

Address communications to the box number indicated and Mail to Easton, Penna.

The American Chemical Society has no information concerning the position advertised—or in regard to those seeking employment.

(Situations Wanted Continued)

ORGANIC CHEMIST Chemical Engineer: A.B., M.A., 3½ years' towards Ph.D. (evenings). 5 years' experience industrial research, principally in organic chemical lines, cosmetics, and pharmaceuticals. Wants position in production or research with good chance for advancement Draft deferred. Available immediately.
Box 37-N-1, Ind. & Eng. Chem., Easton, Pa

PHYSICAL CHEMIST, Ph.D. 1938, B.S. in Pharmacy. Two years' each industrial research and teaching. Thesis electrokinetics. Thorough training organic chemistry and physics Graduate assistant three years. Honorary societies Publications. Married, 34, Protestant. Draft status deferred. Employed. Desires teaching position.
Box 12-T-1, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER, executive, mature, reliable, seeks work. Background: analysis, processing, supervision, some purchasing. Foods, sugar, pharmaceuticals. Further details gladly furnished.
Box 13-T-1, Ind. & Eng. Chem., Easton, Pa

CHEMICAL ENGINEER (Ch.E.), young man, three years' laboratory and plant experience, sixteen years' industrial sales. Forceful speaker; good, clear writer, effective organizer. Now employed, desires position where he can serve Nation more effectively.
Box 14-T-1, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, B.S., Ch.E. Age 29, single. 5 years' experience, 2 years' in vegetable oils and foods, 2 years' in insecticides, 1 year in boiler feed water and corrosion control. Employed. Available for interview N. Y. metropolitan area.
Box 15-T-1, Ind. & Eng. Chem., Easton, Pa

ORGANIC CHEMIST, Ph.D. Feb. 1942, large eastern university. Research on naturally occurring organic bases, sugars, proteins. Good background in synthetic organic. Two years' in research institute and teaching. Desires position in research. 24, single, 2A draft. Phi Lambda Upsilon, Sigma Xi.
Box 16-T-1, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER, B.Ch E. 1933. Textile dying silk and rayon knitted goods — two years. Instructor in General College Chemistry — one year. Vocational Guidance and Personnel work — four years. Age 31, married, in good health and citizen of U.S.A. Available immediately.
Box 18 T 1, Ind. & Eng. Chem., Easton, Pa

ORGANIC CHEMIST, Ph.D., 1941, age 27. Research experience in organic synthesis, sulfur and nitrogen compounds, sterols, hormones. Biochemical and physiological research. Publications. Excellent theoretical training. Desires research position with progressive industrial firm or institution. Employed.
Box 19-T-1, Ind. & Eng. Chem., Easton, Pa.

COLLEGE TEACHING or research, Ph.D., 1940. Organic major Two years' college teaching, general, organic, analytical; two years' graduate assistant. Phi Beta Kappa, Sigma Xi, fellowships, publications. Available June, 1942. Woman, single
Box 21 T 1, Ind & Eng. Chem., Easton, Pa

ORGANIC BIOCHEMIST, Ph.D, 1942. Available March 1. Experience in vitamin D and sterol research, including spectrophotometric and chromatographic technique. Interested in vitamin, enzyme, or drug research. East preferred. Age 26, single, draft deferred. Protestant Member of Phi Lambda Upsilon, Sigma Xi Publication.
Box 24 T-1, Ind. & Eng Chem , Easton, Pa.

INDUSTRIAL HYGIENIST wants a position in defense industry, B.S. in chem. M S. in Eng. Harvard. Age 38, married. 15 years' experience in lead petroleum, gas mask and insurance engineering fields. Last six years supervisor large engineering company. Specialties: Court work, industrial hygiene, boiler feed water treatment. Experienced public speaker. Prefer New England or upstate New York.
Box 29-T-1, Ind. & Eng. Chem., Easton, Pa.

RESOURCEFUL CREATIVE research and development chemist. M.S. organic and physical chemistry. Thorough industrial background in synthetic resins and their applications. Extensive experience in fermentation, distillation and food industries. Now employed but desires more responsible position in above related fields
Box 30-T-1, Ind. & Eng. Chem., Easton, Pa.

ANALYTICAL CHEMIST, B.S. Age 53, married, white, Protestant. Experience; petroleum products, paint analysis and exposures, steel, boiler water, non-ferrous alloys, coal. In charge of laboratory employing eight men. Due to working conditions desires to make change.
Box 32-T-1, Ind. & Eng. Chem., Easton, Pa

CHEMIST, 23, draft deferred, M.Sc. 1941. Over 75 semester hours chemistry. Thorough training in organic and analytical chemistry, micro quantitative organic analysis, research in organic chemistry. Desire position with chance for advancement. Eastern U. S. or New York preferred. Available immediately.
Box 36-T-1, Ind. & Eng. Chem., Easton, Pa.

ORGANIC, CHEMIST, M.S. 1941 recognized university. Organic major, physical minor. Experience in research, two years' teaching. Outstanding record. Activities, honors, publication. Age 24. Draft deferred. Now employed but available on short notice.
Box 40-T-1, Ind. & Eng. Chem., Easton, Pa.

RESEARCH and INDUSTRIAL Chemist, Ph.D. desires research or directing position with progressive company offering wide opportunity for both broad and specialized experience. Wide experience carbohydrates generally, preparation cellulose derivatives, varied synthetic resins, rubber derivatives, and associated fields including films, stabilizers, plasticisers, molding, coating, solvents, adhesives. Generally familiar and experienced with terpenes, emulsions, waxes, synthesis, agricultural waste plastics, literature and economic surveys, patents, research through pilot plant. Employed, married, Protestant, adaptable. Desire broader opportunity.
Box 41-T-1, Ind. & Eng. Chem., Easton, Pa.

PHYSICAL CHEMIST M.S. 1941 Physics minor. Teaching fellowship for two years. Scholarship honors, outside activities. Age 25. Single, draft deferred. Employed in research Desires position with future either in industry or teaching
Box 42-T-1, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST Microscopist. M.Sc in biochemistry; minor in physical chemistry. Also recent year of graduate study. Head, small college department. Published articles American Institute of Chemists. Available soon Research, teaching etc.
Box 43-T-1, Ind. & Eng. Chem., Easton, Pa.

SITUATIONS WANTED (NONMEMBERS)

CHEMIST and BACTERIOLOGIST, M.S. Six years' experience in chemical and bacteriological work, over four years' in food industry. Specialized training in food and sanitation. Research in food and detergents. Desires change for advancement and future. Married, age 29, Protestant. Philadelphia area preferred
Box 31-T-1, Ind. & Eng. Chem., Easton, Pa.

PHYSICAL CHEMIST, extensive experience in academic and industrial research in gas reactions, spectrographic analysis, chemistry of high temperatures, fuel chemistry, activated charcoal and adsorption, reactions in solids, metallurgy, refractories. Exceptional background in crystal structure, X-ray diffraction methods and their industrial applications. Extensive experience in development of industrial processes. References
Box 34-T-1, Ind. & Eng. Chem., Easton, Pa

AGRICULTURAL BIOCHEMIST, B.S. in industrial chemistry. Course work completed for Ph.D. degree Major in Agricultural biochemistry, minors in Soils and Plant Physiology Five years' experience as Assistant Chemist in Fertilizer and Plant Chemistry. Married, 25, draft deferred. Publications. Employed. Desires research or position leading thereto. Location immaterial
Box 38 T-1, Ind. & Eng. Chem., Easton, Pa.

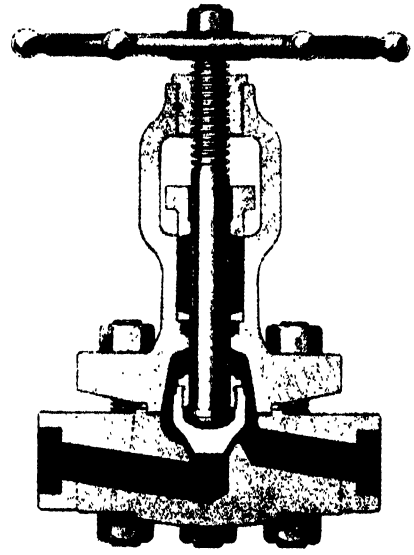
ORGANIC CHEMIST, B.S., two years' research on synthetic drying-oils. Excellent background in organic synthesis, analysis, Phi Beta Kappa.
Box 39-T-1, Ind. & Eng. Chem., Easton, Pa

PHYSIOLOGIST PHARMACOLOGIST now in university post desires change to pharmaceutical work. Prefer directorship of research. Wide background that would be useful where varied program is anticipated Proficiency with vitamins and hormones. Speak Spanish
Box 46-T-1, Ind. & Eng. Chem., Easton, Pa.

GRADUATE, B.S., 1939 from accredited western university. Single, Gentile, age 24. Two years' graduate research in plant alkaloids, research in soils. Desire position with pharmaceutical house or fertilizer company as analyst.
Box 52-T-1, Ind. & Eng Chem., Easton, Pa

Industrial News

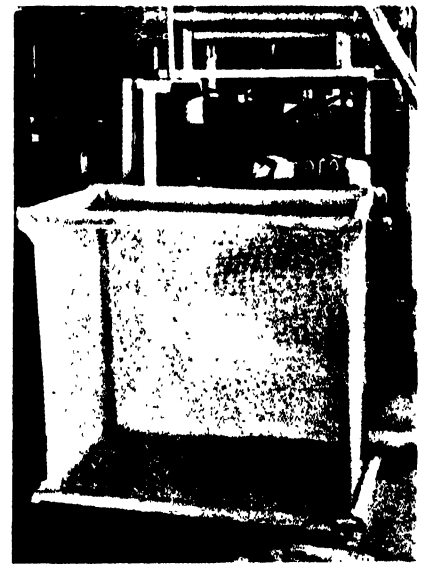
CONTINUED FROM PAGE 152



away with the delays and limitations of photographic processes.

Designed to accommodate plates or films as large as 4 by 10 inches, the scanning unit includes on a heavy cast base, an optical system, a plate stage, a drive mechanism for the plate stage, an amplifier, and controls grouped at a convenient location.

Integral Seat Valves



EDWARD Intex valves, hard-surfaced integral seat globe stop valves for pressures to 1500 pounds at 950° F., are made by The Edward Valve & Mfg. Co., Inc., East Chicago, Ind.

Carrying the trade name Intex (integral seat valves of extra value) these globe

valves are specifically designed for high-pressure and high-temperature service. The disk and integral seat are faced with Stellite, a high hardness alloy, which is extraordinarily resistant to both erosion and corrosion. Minimum weight with abundant strength has been accomplished by equalizing the distribution of metal around the body flow areas, so that in heating and cooling there is no distortion.

Plating Tank Nets

A NEW aid to good electroplating practice has been placed on the market by the Hanson-Van Winkle-Munning Co., Matawan, N. J., as the HVWM tank net. These nets are placed in plating tanks so that any work dropped may fall into the net and be easily recovered.

This net is made of 0.5-inch stretched mesh, hung square, 6-thread medium

MICRO-ELEMENTARY ANALYSES: C, H, N, S, P, Halogens, Methoxyl, Mol. wt., etc., U.S.P. and other official tests, Purity tests, Microinorganic assays, Spot tests, Micro-distillations, Toxicological investigations, and typical micro-chemical research work. Dr. Carl Tiedcke, 366 Fifth Avenue, New York, N. Y.

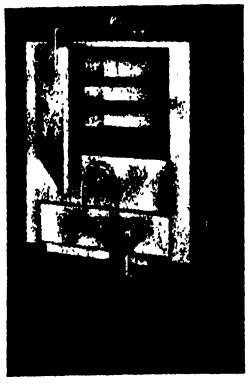
INDEPENDENCE and SPLENDID income to chemist or chemical engineer who will propose well paying chemical manufacture based on thorough practical experience, line indifferent Box 22 T-1, Ind. & Eng. Chem., Easton, Pa.

WANTED: Process for the production of powdered iron for the powder metallurgy industry. Box 20-T-1, Ind. & Eng. Chem., Easton, Pa.

WANTED: Helvetica Chimica Acta, V. 1-22, 1918-1939. Comptus rendus hebdomadaires des seances de l'academie des science, 1900-1940. Please state condition and quote price. Please quote f.o.b. Peoria, Illinois, and mail quotations to Northern Regional Research Laboratory, Peoria, Illinois

WE OFFER: 1500 lbs. Copper Fluosilicate, 5 tons each Calcium Fluosilicate, Barium Fluosilicate also Calcium Levulinate, Levulinic Acid, Sodium Glutamate, Allantoin, Tryptophane, d-Ribose, Dulcitol, Fucose, Mucic Acid, Raffinose Hydrate, Xylose. Box 25-T-1, Ind. & Eng. Chem., Easton, Pa.

FOR SALE: Chemical abstracts, v. 2-25, 1908-1931 Lacks Decennial indexes. Newly bound in 73 volumes. Lafayette College Library, Easton, Pennsylvania.



FOR SALE: Used Aluminum Jacketed Kettle, 5½ feet diameter by 7½ feet high, capacity 1000 gallons. Located in Central States. Box 26-T-1, Ind. & Eng. Chem., Easton, Pa.

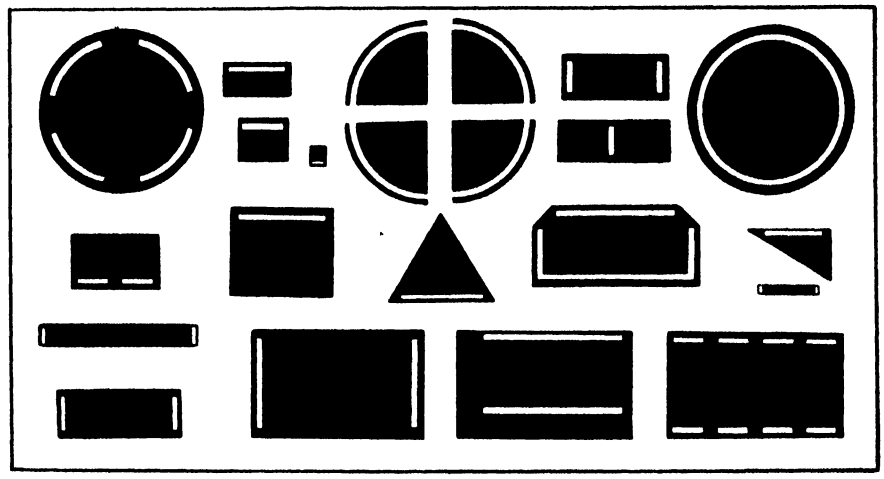
FOR SALE: 100 lbs. each Chalcopyrite, Cinnabar, Pyrrhotite, Hematite, Apatite, Rhodonite, Malachite, Azurite, Optical Quarts, Euxenite, Samarskite, Polycrasite, Gadolonite, Columbite, Halite, Anorthite, Carnotite, Molybdenite concentrates, Wollastonite, Limonite also Fluorescent Minerals. Box 27-T-1, Ind. & Eng. Chem., Easton, Pa.

FOR SALE: Journal of Physical Chemistry, vols. 1-39, complete; Trans., American Institute of Chemical Engineers, vols. 1-35 bound; Trans., American Electrochemical Society, vols. 1-61, bound. W. Westerfield, 612 West 112th Street, New York, N. Y.

twine. It can be used in nickel, cyanide copper, Mazic zinc, acid zinc, and cadmium solution to advantage. It is not suitable for alkaline cleaners or sodium stannate tin solutions.

Explosion-Proof Cabinet

THE Precision Scientific Co., 1736-1754 North Springfield Ave., Chicago, Ill., announces a new series of explosion-proof constant-temperature cabinets, heated by steam and approved by Underwriters' Laboratories, Inc., for use in hazardous locations, Class I, Group C and Group D, in which flammable volatile liquids, highly flammable gases, mixtures, or other highly flammable substances are manufactured, used, handled, or stored in other than their original containers.



Basically the cabinet is a precision-Freas mechanical convection model in which a motor-driven turboblower produces a forced circulation of heated air across the working chamber. Steam, instead of electricity, is used for heating.

Temperature is automatically controlled by a pneumatic thermostat which opens or closes an air-operated steam valve to control the steam supply. Should the air supply fail, the valve automatically closes, turning off the steam supply completely. Control accuracy is between ±2° and ±3°, depending upon the temperature at which the cabinet is operated. Temperature range is 35° to 150° C.

Photronic Dry-Disk Photocells

THROUGH the development of a new manufacturing technique, a stable, dry-disk photocell can now be supplied in a wide variety of shapes and sizes, including multiple cell circuits on a common electrode.

These cells can be furnished to meet specifications as to output, resistance, spectral response, etc., regardless of the quantities involved, by the Photronic Division, Weston Electrical Instrument Corp., 614 Frelinghuysen Ave., Newark, N. J.

Some of many shapes in which Weston Photronic photocells are available.

FOR SALE *Equipment for complete unit for the production of*

10,000 Cu. Ft. REDUCING GAS PER HOUR

Gas is free of oxygen, hydrogen and is dry. The equipment includes:

1 duplicate gas generating units and auxiliaries.
2 charging platform, bucket and hoist.
3 primary and secondary coolers.
4 sawdust scrubber cleaner.
5 air drier or dehydrator.
6 gas drier or dehydrator.
7 gas exhauster.
8 oxide purifiers for the removal of H_2S.
9 gas, steam and air piping.
10 regulators and instruments.

For particulars as to location, price, terms, etc., address

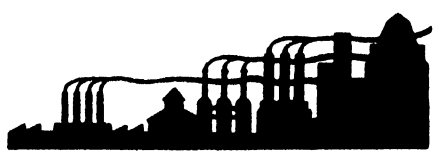
CHEMICAL AND ENGINEERING NEWS

HARRISON E. HOWE, Editor

PUBLISHED BY THE AMERICAN CHEMICAL SOCIETY

VOLUME 20 FEBRUARY 10, 1942 NUMBER 3



The "Production Army" vs. The "Combat Army"

THE present war is to be fought and won, or lost, by two groups of men—namely, the "production army" and the "combat army". The combat army of the United States, Great Britain, and the other United Nations has no hope for success if the production army loses its battle or is seriously retarded. The "officers and men" in the production army constitute as real an army and are as necessary to the war effort as the combat forces. They wear no uniforms and are neither commissioned nor drafted. In order that the public may be aware of their status, it is hoped that they will be furnished with some insignia to show that by government direction they are serving in a special branch of the Army where, by use of their extensive training, they are making their most effective contribution toward winning this war. *Chemists, chemical engineers, physicists, and other essential technical men are officers of the production army. It cannot function without them.*

There is far greater immediate danger to the ultimate outcome of the war from shortages of such manpower than there is from any lack of officers and men in the combat forces. Without production of essential materials the war will be lost, since the combat forces cannot exist without materiel. In establishing the Selective Service System, this situation was foreseen. Brigadier-General Hershey deserves great credit for so implementing procedures through the 6,000 local boards that chemists and chemical engineers (except those already mortgaged to the combat army through the R. O. T. C. and the Army and Navy Reserves) are for the most part still engaged in production and supply. It is, however, true that some three hundred or more chemists and chemical engineers have been inducted into the service where their specific training cannot be utilized. At present their years of training are lost to the Nation.

Early in December 1940, on request of the Defense Committee of the AMERICAN CHEMICAL SOCIETY, General Hershey met with them to discuss this general situation. At his request, a questionnaire was sent to a number of colleges and universities and to 29 companies selected by the committee as a cross-section of chemical industry. From the replies received and the data collected, the impending shortage of chemists and chemical engineers was evident. With these data, and after further corroborative advice from the U. S. Department of Labor, the Selective Service classified chemists and chemical engineers as groups "in which it is expected that the demand currently exceeds, or in the immediate future will exceed, the supply of qualified workers". A memorandum to this effect was sent to the state and local Selective Service Boards. Until recently the local boards have, in general, acted to alleviate the situation described. Since Pearl Harbor and the declaration of war, there has been an increasing tendency to consider that real urgency lies only in service in the combat army, with a decreasing realization of the grave danger that it might become inoperative if inroads are made on production.

As this situation became known, it was evident that another survey should be conducted to obtain current information. Accordingly, on December 23, 1941, the following letter and appropriate questionnaire were sent to the colleges and universities whose departments of chemistry and chemical engineering have been approved by the AMERICAN CHEMICAL SOCIETY, and to the same 29 chemical industries which were circularized a year before:

AMERICAN CHEMICAL SOCIETY
OFFICE OF THE SECRETARY

WASHINGTON, D. C.
1155 Sixteenth St., N. W.
December 23, 1941.

Because of the war, the increased number of draftees, and impending reclassifications, the Defense Committee of the AMERICAN CHEMICAL SOCIETY deems it necessary again to obtain, as promptly and accurately as possible, current information to enable the AMERICAN CHEMICAL SOCIETY to act with intelligence. We know that questionnaires are a pest, but hope for your aid and forebearance on account of the exigencies of the situation.

We again need, and need badly, facts concerning the demand for, and availability of, chemists and chemical engineers for the chemical plants of America upon which the country must depend for its supplies in this national emergency. These facts, when obtained, will enable us to give Selective Service authorities explicit data that will aid them in making an intelligent decision as to the deferment of chemists and chemical engineers in order that the defense program may proceed with the acceleration that is already underway.

Please answer the attached questions and send to me in care of the AMERICAN CHEMICAL SOCIETY BUILDING, 1155 16th St., Northwest, Washington, D. C.

Demand for Chemists and Chemical Engineers

College Questionnaire

1. Please estimate the present number of graduates of your institution in chemistry and chemical engineering who are now unemployed: (*a*) A.B. or B.S.; (*b*) M.A. or M.S.; (*c*) Ph.D. or D.Sc. Comments are desired.

2. In your opinion, has the shortage shown last year of properly trained chemists and chemical engineers at the bachelor's, master's, or doctor's levels declined or been aggravated, and to what extent?

3. Are you receiving more or less requests for chemists and chemical engineers with the B.A. or B.S., M.A. or M.S., or Ph.D. degrees than in the past three years? Please compare the number of those graduating at the different levels in June 1942 who have already accepted positions with the number who graduated in 1941 and were placed as of December 23, 1940. This information is especially important.

4. To what extent will advanced R. O. T. C. training divert your 1942 graduates from the production army into the combat forces?

5. If you have distinct departments of chemistry and chemical engineering, please see that a reply is sent from each.

One hundred, out of 118 educational institutions addressed, have reported. The details of the replies are so similar that the picture is as clearly painted as if every institution had responded. An appalling shortage of trained individuals in chemistry and chemical engineering is shown. By far the greatest proportionate demand is for those to be graduated at the doctorate level, most of whom have accepted positions pending receipt of their degrees. The colleges report almost without exception that chemical or chemical engineering alumni are all employed and that current demands cannot be supplied. Only a few persons are known to be unemployed and these because of chronic illness, physical defects, or objectionable personal characteristics. No good purpose can be served by printing here the institutional detail. However, the following comments from letters of transmittal describe the general situation:

A Few Pertinent Quotations from College Replies

Buffalo, University of, Department of Chemistry

In common with other schools, we feel very keenly the necessity for a more definite policy with regard to chemistry students and the Selective Service. Our university is developing plans for a more rapid completion of the work for the bachelor's and advanced degrees by elimination of vacation time, at least in part. For the maintenance of our work, it is imperative that we be able to depend upon deferment or exemption for graduate students and assistants. I feel that your committee has a very important defense task in impressing the Selective Service authorities with the importance of this matter.

California, University of, Department of Chemistry

The Army and Navy have removed from the supply of men a large percentage of the more able students.

Georgia School of Technology, Department of Chemical Engineering

R. O. T. C. and Naval training will divert approximately 40 per cent of this year's graduating class into the combat service. This includes an even larger percentage of our best men.

Harvard University, Department of Chemistry

The shortage of trained chemists is the most serious in our experience, especially at the doctor's level.

Illinois, University of, Department of Chemistry

We are now receiving three or four times as many requests for chemists and chemical engineers as we did a year ago. At Christmas time last year about one fourth of the Ph.D. candidates had been placed, while half of the 1942 class is already placed.

Iowa State College, Department of Chemistry

We not only have no alumni unemployed but are having a very difficult time to maintain our teaching staff. Candidates for part-time positions this past year are below the average of previous years, in ability and in training in chemistry. All the Ph.D. candidates for graduation the remainder of this college year have been placed as against 50 per cent placement at the same date last year.

We shall continue to need chemists in greater numbers and for a longer period of time than we had anticipated for reasons now apparent to all. It is most important that we have good faculties to do the training and high-grade young people to train.

Kansas State College, Department of Chemical Engineering

The shortage shown last year of properly trained chemists and chemical engineers at the bachelor's, master's, and doctor's levels has been aggravated in recent months. This is particularly true of master's and doctor's men. Many of these men are leaving school before completing their work because of the unfortunate attitude of many Local Selective Service Boards.

Maryland, University of, Department of Chemical Engineering

Advanced R. O. T. C. training has diverted our past graduates from positions in industry to combat forces and will continue to do so. All of our 1941 graduates are now in the combat forces.

The shortage of properly trained chemists and chemical engineers appears to have increased very much from last year in all three levels, bachelors, masters, and doctors, particularly in the field of doctors.

Massachusetts Institute of Technology, Department of Chemical Engineering

About 42 per cent of the seniors in chemical engineering will become Reserve Officers.

Massachusetts Institute of Technology, Department of Chemistry

We are receiving more requests for chemists of all three grades as compared with the last three years. The graduates of June 1942 with the Ph.D. or M.S. degrees are placed at the present time to the extent of 88 per cent of our total.

New York University, Department of Chemical Engineering

Practically all students are accepting commissions in the Army or Navy.

Pennsylvania State College, The

Shortage has increased for all levels; greatest for Ph.D. training in organic chemistry.

Pennsylvania, University of, Department of Chemistry and Chemical Engineering

Judging by the number of inquiries received, the shortage of properly trained chemists and chemical engineers, which was evident last year, has been extensively aggravated. For months I have been compelled to tell potential employers that the only way I knew to secure a properly trained chemist or chemical engineer was to attract him away from someone else.

Polytechnic Institute of Brooklyn, Department of Chemical Engineering

I trust that the work of your committee may serve to alleviate the conditions we are continually faced with in regard to the drafting of students—a particularly difficult problem in our graduate courses, which are given on an evening basis, and where men are employed in chemical industries. We have found some cases where the draft boards refused deferment for men who are not only engaged in important chemical engineering work in vital industries, but who are also receiving graduate training in evening work. Such an attitude on the part of the draft board of course intensifies the problem of industry in maintaining an adequate force of competent chemists and chemical engineers for their increased production schedules.

Polytechnic Institute of Brooklyn, Department of Chemistry

We could have placed during the past year twice the number of men who have obtained degrees in that time. Even the men of rather low scholastic standing and with rather poor personalities have been placed.

In our opinion, the shortage of properly trained chemists shown last year has been aggravated. This shortage was then and is now most noticeable at the doctor's level.

Purdue University, School of Chemical and Metallurgical Engineering

There have been a great many more offers made than at the same time last year

The AMERICAN CHEMICAL SOCIETY assumes no responsibility for the statements and opinions advanced by contributors to its publications.

C.; Telephone, Republic 5301; Cable, Jiechem (Washington). Advertising Department, 332 West 42nd St., New York, N. Y.; Telephone, Bryant 9-4430. Entered as second-class matter at the Post Office at Easton, Penna., under the act of March 3, 1879, as 24 times a year on the 10th and 25th. Acceptance for mailing at special rate of postage provided for in Section 1103, Act of October 3, 1917, authorized July 13, 1918.
Annual subscription rate, $2.00. Foreign postage to countries not in the Pan American Union, $0.60; Canadian postage, $0.20. Single copies, $0.15. Special rates to members.
No claims can be allowed for copies of journals lost in the mails unless such claims are received within 60 days of the date of issue, and no claims will be allowed for issues lost as a result of insufficient notice of change of address. (Ten days' advance notice required.) "Missing from files" cannot be accepted as the reason for honoring a claim. Charles L. Parsons, Business Manager, 1155 16th St., N. W., Washington, D. C., U. S. A.

and about 50 per cent more interviews granted. I do find, however, that the boys are much more choosy than they were last year; witness the fact that a number of our seniors have had from three to seven offers and have not yet been placed.

Yale University,
Department of Chemistry

One visiting industrialist emphatically stated that his company is only 20 per cent ready, both from a production and from a personnel standpoint, to meet the newest emergency. He urged us to keep chemical students enrolled at Yale and thus prepare themselves for industrial service.

In the graduate level 50 per cent of our Ph.D.'s of June 1942 are already placed and we have many conferences scheduled with industrialists during the week following the opening of school on January 5. Judging from the tenor of the letters from these industrialists, the remainder of the Ph.D.'s will be placed early in the year.

In addition to this survey of the approved colleges, the AMERICAN CHEMICAL SOCIETY Committee on the Professional Training of Chemists made a survey as of June 1940, 1941, and 1942, showing that the output of chemists and chemical engineers is not increasing and that a large number of prospective technical men have, through a mistaken patriotism, ceased to train themselves for the production army. Now it appears certain that no increase in the annual output can be expected; indeed, a decrease is likely to take place. The details of this survey follow:

Census of Chemical and Chemical Engineering Graduates

Comparative Data, 1940, 1941, 1942

Number of Colleges, 506

	1940	*1941*	*1942**
CHEMISTS			
B.S.	4,284	4,472	4,400

GRAND TOTAL	7,452	8,020	7,858

* Replies received from 450 colleges—56 added by proportion.

Requirements for Chemical and Chemical Engineering Personnel

Industrial Questionnaire

1. (*a*) To the best of your judgment has the current shortage of chemists and chemical engineers been aggravated since you reported a year ago? (*b*) How much?
2. How many additional chemists and chemical engineers do you anticipate will be needed by your company to carry on efficiently throughout 1942?
3. Please compare the approximate number of competent chemists and chemical engineers that you will need in 1942 with the number employed in 1941 at the following educational levels: (*a*) B.A. or B.S.; (*b*) M.A. or M.S.; and (*c*) Ph.D. or D.Sc.
4. Are your requirements for chemists and chemical engineers likely to increase or decrease in the next two years?

Twenty-eight of the 29 leading employers of chemists and chemical engineers addressed have reported. They estimate a need for 2,152 more such persons in connection with this year's expanding operations. One of these corporations will need 500, two require 300, one estimates 125, and three, 100 each, down to a minimum of five. These 29 corporations comprise only a fraction of the chemical companies of America. Essential industry needs in 1942 from 2,000 to 3,000 more chemists and chemical engineers than will be graduated or are otherwise available. No one knows from whence they are to come.

Magnesium, aluminum, transparent plastics, rubber, explosives, medicinals, and innumerable minor but essential supplies needed by the Army, Navy, Signal, Sanitary, and Medical Corps, can be produced only under the guidance of trained engineering and chemical personnel. The Army and Navy are deeply concerned. Investigations made by this organization prove that trained personnel to produce this material is lacking. Not only the finished product but also the raw materials going into smokeless powder, rubber, etc., can be produced only under the active control of experienced chemists and chemical engineers.

Per contra, the Army and the Navy have been wide awake to obtain the best specimens of genus homo for officer personnel through the Reserve Training Corps. Agreements have been made with our brightest and most physically able college students whereby they are expected, and even required, to accept commissions in the Army upon graduation. Among these are many chemists and chemical engineers whose specific training has little bearing upon their selection or upon their duties after they are enrolled. In other words, these chemists and chemical engineers are to be enrolled as officers for their mental and physical abilities rather than with any thought of applying them to chemical problems or production.

Nonstudent reserve officers who have been called into service are, except for the relatively small number in the Chemical Warfare Service, assigned to positions which have little bearing upon the subject for which they have been scientifically trained. Many of these officers have asked us to urge the responsible officials to have them transferred to more appropriate occupations, but it appears impossible to obtain such assignments. The extent to which these Reserve Officers have been called into service constitutes a grave emergency. The number can be ascertained only from military records.

According to our information, the Chemical Warfare Service has 1,300 reserve officers on duty, of whom 85 per cent are chemically trained. Six hundred additional C. W. S. reserve officers are available but have not yet been called to service. Approximately 400 C. W. S. officers are on duty with other arms of the services. We believe that at least 50 per cent, and possibly 75 per cent, of these men could be replaced by nonchemically trained men without loss of efficiency. The Chemical Warfare Service informs me that it needs 3,000 such officers.

We have in this office records of highly trained chemists and chemical engineers, many of them Ph.D.'s, who have been taken from the production army for service in the Field Artillery, Coast Artillery, Infantry, and the Marine Corps. Many complaints are being received from our chemical companies that production is falling off and that future production is jeopardized by the withdrawal of these production officers from industry. While we recorded no detail, we know from many letters and telephone calls that industry has protested in hundreds of cases against the taking of these essential men from the production army. Only in extreme cases have these production officers been allowed to continue in the industry. This office has been swamped with requests for assistance in maintaining the chemical staffs in essential industries so that production might continue.

Both the Army and Navy have perfectly legal mortages on their reserve officers. These officers have a moral obligation to abide by their commitments and, of course, will do so. The Army and Navy had the foresight to involve them years in advance. The chemical departments of the colleges failed to see that their graduates were left free to serve where their special training and talents could be used in essential industry. Replies indicate that about 25 per cent of all graduates in institutions with R. O. T. C. or Naval Reserve training have signed these mortgages upon their future. Massachusetts Institute of Technology, one of our very best institutions, reports that 42 per cent of its 1942 chemical engineers are so involved. The question arises: Shall the Army and Navy foreclose their mortgages with the practical certainty that production and supply will be hamstrung? The choice to foreclose or not is theirs. It is the duty of the AMERICAN CHEMICAL SOCIETY to see that they act with their eyes open.

The 6,000 Selective Service Local Boards, although made up of patriotic men, are by no means omniscient; nor are they aware in many instances of the key positions filled by chemists and chemical engineers in production and supply. General Hershey has gone as far as he felt he could, within the law, in making suggestions to the boards and recently reiterated the policy to be followed. This has always

been his personal attitude, and we are sincerely appreciative. However, it has not been seconded by all of his subordinates, to the great confusion of the Local Boards, and, to a lesser extent, of the Appeal Boards.

An editorial entitled "Defeat" which appeared in the February issue of *Industrial and Engineering Chemistry* clearly portrays this very unfortunate situation, a situation which is not allowed to exist in England, Germany, or, so far as we can determine, in the armed forces of any other combatant. A list of these misplaced soldiers has been sent to Selective Service Headquarters, which states this is outside its jurisdiction. The Chemical Warfare Service, to which the list also was sent, claims to be helpless to remedy the situation under rulings of G-3, although it has made every effort to do so.

Until quite recently students of chemistry and chemical engineering have been allowed to continue their training, even to the doctorate grade, but in the past two months misunderstood communications to the Local Boards resulted in very great confusion. Numerous men "in training for" necessary industry have either been forced to discontinue their studies or have received information that in all probability it would be impossible for them to go on to graduation. This has been particularly true of candidates for the doctorate degree. General Hershey is very rapidly correcting this impression as indicated by the following two communications:

January 8, 1942

MEMORANDUM TO ALL STATE DIRECTORS (I-341)

SUBJECT: CLASSIFICATION-NECESSARY MEN (III)

Confirming Telegram of January 7

Complaints in increasing volume indicate Local Boards are reopening the cases of registrants deferred for occupational reasons and reclassifying such men in Class I-A. I direct that Local Boards be immediately informed of the continuing necessity for deferment of men necessary to activities, the maintenance of which is essential to the war production program and the national health, safety, and interest. State directors should avoid calls upon Local Boards except upon the basis of available Class I-A men.

HERSHEY

Telegram to Texas State Director of Selective Service

January 9, 1942

This office has been informed that your headquarters has issued instructions to Local Boards that no graduate student can be considered for deferment. No such policy has been adopted by this headquarters and Local Boards should be informed that graduate students including part-time assistant instructors may be considered for occupational deferment on an individual basis in those fields in which a national or local shortage is known to exist.

HERSHEY

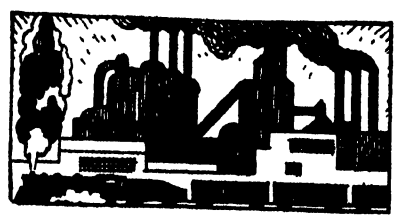
Additional quite unambiguous instructions are being formulated and will probably be issued to clear up the situation.

In our opinion, if the production army, with increased output and new material demanded of it, is to supply the combat forces, it is essential for the War Production Board, the Army, and the Navy to see that:

1. Definite and unambiguous instructions are issued to Local Boards and especially to Appeal Boards that chemists and chemical engineers in the production army or in training therefor are *de facto* necessary men.

2. Reserve Officers now serving in the production army are not called to the combat forces, and that many already called be returned in order to assure supply.

3. Officers and men in the Army, Navy, and Marine Corps, who are trained chemists and chemical engineers be assigned to chemical work or released to the production army.



4. Students of chemistry and chemical engineering now enrolled in the R. O. T. C. or Naval Reserve be released by the Army and Navy to the production army without discredit.

5. Students of chemistry and chemical engineering, considered by their instructors to be qualified, be allowed to complete their education and when graduated be allowed a reasonable time to become connected with the production army or to become instructors for those in training. Such training should be accelerated through the Office of Education with federal financial aid where necessary.

It is our belief that the officers of the combat forces will cooperate if they realize that otherwise there is little prospect of procuring the necessary supplies for their upkeep and instrumentation.

All of these data, with full detail, have been officially presented to high authority. Whatever the outcome of the battle being fought by the production army, the AMERICAN CHEMICAL SOCIETY will have sounded a clear warning. PERSONNEL, NOT MATERIEL, WILL BE THE BOTTLENECK; LARGELY THROUGH WASTE. It is not yet too late.

CHARLES L. PARSONS, *Secretary*
AMERICAN CHEMICAL SOCIETY

Nazis Exhibit Synthetic Resins in Switzerland

GERMAN authorities recently placed on exhibit at Zurich, Switzerland, German synthetic resins and similar construction materials, intended to show the progress made in adapting modern plastics to engineering use as an aid to conserving metals for war needs.

For fabricating gas masks, for instance, a nonflammable celluloid substitute, Cellon, was shown in a wide range of applications. Also exhibited were a phenolic resinoid, Trolitan, for use in electrical insulation, and what was said to be a new product, Trolitax, a synthetic resin-impregnated paper of high dielectric value, used in constructing transformers, electric motors, and similar apparatus.

As a substitute for hard tropical woods there was Lignafol. Pollopas, a urea-formaldehyde plastic for making utilitarian small parts, and trolit and trolitul, dye-cast synthetics, were also included.

American Source of Pyrites in Cyprus Closed

WAR conditions have closed an American source of pyrites in the Crown Colony of Cyprus, where production has virtually ceased. An American concern engaged in this industry there closed out production completely in 1941, and dwindling output was reported for local companies.

Of 1940 exports, 75,745 tons of cupreous pyrites went to Europe. Of 26,723 tons of cupreous concentrates, the United States took 19,111 with 7,612 tons going to Japan. Total output in 1940 by local mine organizations was 247,932 tons, compared to no production in the first five months of 1941. However, one company is reported to have engaged to supply about 10,000 long tons of pyrites for Egyptian consumption, and to furnish this quantity, a resumption of mining will be necessary.

Exports of Derris from Netherlands Indies Jeopardized

THRIVING new cultivation of derris in the Netherlands Indies and its export in any quantity have been jeopardized by war inroads.

Cultivation of derris in the Netherlands Indies was not started until about 1937, but by 1941 estates had 8,000 hectares planted in addition to a rather large native cultivation. Virtually the entire amount was exported to the United States and Britain. In 1941 it was estimated that exports would total 1,000 metric tons, and in the coming year 1,200 metric tons were expected to be available for export.

However, shipping space for derris root has been greatly reduced for many months to make room for more strategic products, and present war conditions probably have aggravated the situation.

Travel to Memphis

MEMPHIS, the convention city of the AMERICAN CHEMICAL SOCIETY from April 20 to 24, 1942, is one of the few substantial cities in the United States which has grown because it must. It is situated in the midst of the most fertile lands in America, and as these lands were developed Memphis necessarily grew to meet the demands of the people in the surrounding area.

Of course Memphis was established as a city because of the natural environment. It is located on the highest point of land in the Mississippi Valley between the Great Lakes and the Gulf of Mexico. Beyond any historical records Memphis was a meeting place for the Indians, who established trails like spokes of a great wheel, with the Chickasaw Bluffs as the center. These trails are today great highways of hard-surfaced roads so that access to the city from all parts of the country is easy and pleasant. In the early days of steamboating the people of Memphis built their own boats. When railroads began to be constructed they, too, followed the spokes of the Indian wheel. Thus Memphis became one of the great commercial centers of the South. In the old steamboating days it was not unusual to find 75 to 100 packet steamers tied up at the Memphis wharves, but today the barge lines handle twice as much freight as in the best days of the steamboat.

With the development of commercial aviation, American Airlines used, and still uses, Memphis as one of its east and west transportation centers. It was followed almost immediately by Chicago and Southern Airlines, and later by Eastern Airlines. Additional lines were projected but will have to await war developments. However, Memphis is one of the great air transportation centers of the United States and has one of the finest airports in the country.

The eight national highways, ten trunk-line railroads, and three air lines which enter Memphis from every direction afford easy access to this city for the chemists of North America.

But of the several modes of travel the automobile offers by far the most pleasure to the visitor who will take time for the interesting stop-overs and side trips to enjoy the beauties of the Southland in the springtime. In the middle of April spring is in full glory in the Midsouth, wisteria and azaleas are in full bloom, the rainy season is over, and the weather is perfect for travel because the long hot days of early summer have not arrived.

The route from the northeastern seaboard leads through historic Virginia and over the Skyline Drive, the scenic motorway through Shenandoah National Park. The park itself lies in the Virginia section of the Blue Ridge Mountains and includes an area of magnificent beauty extending for a distance of approximately 100 miles along the crest of the mountains. From Front Royal on the north to Waynesboro on the south, this is a region of sharp ridges, narrow valleys, and unbroken forests. One of the sights on this direct route is Natural Bridge, the miracle in stone that was once purchased from George III by Thomas Jefferson. Alternate routes from Washington, D. C., might include visits to the historic spots of eastern Virginia, such as Richmond, Yorktown, Jamestown, and the colonial restoration at Williamsburg.

Continuing from the Skyline Drive, however, is the partially completed Blue Ridge Parkway leading through Asheville to the Great Smoky Mountains National Park. These are the most massive mountain uplifts in the East and are the oldest mountains in America. The name comes from the blue haze, sometimes as dense as smoke, which almost always hangs over the mountain peaks. Or the more direct route to Knoxville may be taken by branching off at Roanoke. Knoxville is the seat of the University of Tennessee and headquarters of the TVA. Near by is Norris Dam, highest unit in the Tennessee River development.

From Knoxville there are two routes to

STATE OF TENNESSEE, DEPARTMENT OF CONSERVATION

The Great Smoky Mountains of Tennessee and North Carolina

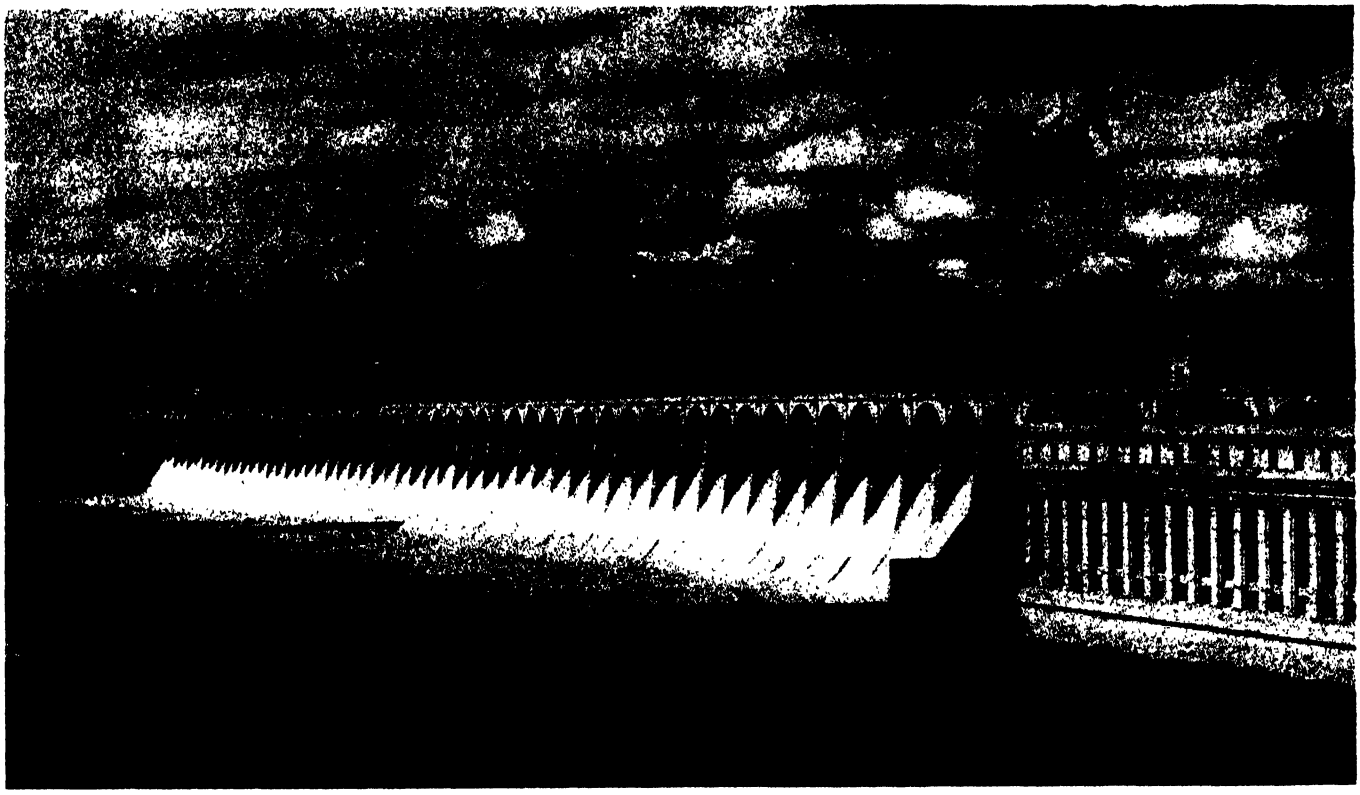
ON TO MEMPHIS

CLINE STUDIO

STATE OF TENNESSEE DEPT OF CONSERVATION

STATE OF TENNESSEE DEPARTMENT OF CONSERVATION

Above. The Great Smoky Mountains in east Tennessee. *Below.* Stanton Hall in Natchez, Miss. *Left.* Reelfoot Lake situated near Memphis.



DIXIE MOTOR CLUB

A. C. S. MEETING

April 20 to 24

Wilson Dam in northern Alabama, source of TVA power for the city of Memphis

Memphis. One is through the Cumberland Mountains to Nashville, capital of Tennessee and former home of Andrew Jackson, whose "Hermitage" is open for inspection. The other leads along the southern border of Tennessee through Chattanooga. From here Sherman began his march through Georgia and in this vicinity were fought some of the bloodiest battles of the Civil War including Chickamauga, Missionary Ridge, and Lookout Mountain, the "Battle above the Clouds". Near Memphis is Shiloh National Military Park, scene of the second great battle of the war between the states.

Just across the border in Alabama is Muscle Shoals and the great Wilson Dam, cornerstone of the TVA. The dam was begun in 1918 as part of the project to develop a government nitrate plant to produce military explosives and was completed in 1925. The facilities of the nitrate plant were utilized during the years before the present war for the production of fertilizer from near-by limestone and phosphate rock deposits. The part of the nitrate-producing equipment that was not necessary for this work, however, was kept in standby condition and the precaution has proved a wise one.

Another spoke of the wheel leads from Cincinnati and Louisville through the Blue Grass Region of Kentucky. Along this route are Mammoth Cave and the birthplace of Abraham Lincoln which is preserved as a national park.

Within two hours drive north of Memphis is Reelfoot Lake, the fisherman's paradise, on the road from Chicago and St. Louis. The lake was formed during a series of earthquakes in 1811 and 1812 when the wrenching of the earth caused a great fault at this point, and the sinking of 20,000 acres formed the basin. The shallow bed of the lake is a natural spawning ground, and fish propagate so fast that a closed game fishing season or artificial restocking have never been necessary. A stop-over at Reelfoot Lake, which is reached from either Union City or Tiptonville, would be a new experience for those chemists who are followers of Isaac Walton. Irving S. Cobb has said, "Reelfoot Lake is an afterthought of creation. It is the newest big thing in Nature on this hemisphere. It is the best game and fish country, natural or artificial, that is left in the South today."

Confederate fortification in Vicksburg National Military Park

Once more the wheel turns. The approaches to Memphis from Texas, the West, and the Northwest all pass through the Ozark Mountains and converge upon Little Rock, capital of Arkansas. Near Little Rock is Hot Springs National Park, noted year-round resort where 18 bathhouses apply modern methods of water treatment. This was the first national park reservation in the country, for in 1832 the hot springs and four square miles of land surrounding them were set aside by Congress for the future disposal of the United States. Today the 47 springs have a daily flow of 1,000,000 gallons. The water is collected into one central system from which it is distributed to all of the bathhouses, and the rates are fixed by the Secretary of the Interior.

The traveler to Memphis might

like to make the return trip by a different route. For this, a trip south through Mississippi to New Orleans with its unique French Quarter and Mobile where the famous Bellingrath Gardens are open the year around is recommended. There are two direct routes to New Orleans. One leads through Sardis, about 35 miles from Memphis, where the formation of Sardis Lake followed the largest earthwork dam in the world. Further down is Jackson, capital of Mississippi. The other route is through the Mississippi Delta to Vicksburg and Natchez. In the National Military Park at Vicksburg are preserved the battlefields and monuments to the siege which won it the name, "The Gibraltar of the Confederacy". Vicksburg is chiefly noted among the world's battlefields for its distinctive topography and for the extensive remains of battlements—nine major Confederate forts, ten Union approaches, and many miles of breastworks, gun emplacements, and rifle pits. Free guide and museum service is available to visitors under the direction of the historical staff of the park.

Natchez was a booming river town in the heyday of the Confederacy, but its star waned with the declining fortunes of the South during the years that followed. In the last decade, however, interest in the quaint old city has been revived with the pilgrimage and garden tours. Virtually untouched by the Civil War, Natchez has what is probably the finest collection of ante-bellum homes in the South today. By throwing them open and dressing the hostesses in the garb of yesteryear during the pilgrimage season in March, the city has become a mecca for tourists and is now "Natchez—Where the Old South Still Lives".

The old towns and cities of Mississippi have their quota of ante-bellum homes in various states of repair. Some are just as the Civil War left them, but many have been restored and are now occupied, sometimes by descendants of the original owners, but invariably by people who are proud to display them as living monuments to a glorious past. These mansions of the classic revival were a characteristic expression of the feudal fortunes made on cotton during the first half of the last century. And to the desire for companionship and fraternity, sharpened by the isolation of the huge plantations, are traced the beginnings of the Southerners' reputation for hospitality.

But in these modern times when the Indian trails have been transformed into concrete highways and ribbons of steel, southern hospitality is still a heart-warming welcome, and travel through Dixie affords many opportunities to enjoy its pleasures. Travelers by rail have the same stop-over privileges as autoists, and either mode of travel can make the trip to Memphis interesting.

Progress Report by Committee on Economic Status

THE attached table contains a preliminary tabulation of returns of the mail questionnaire survey received by the Bureau of Labor Statistics as of January 10, 1942. It should be noted that 24,490 questionnaires were mailed to individual members of the AMERICAN CHEMICAL SOCIETY resident in the United States and its possessions.

Plans are being formulated for the making of final tabulations and the necessary tables to be presented in the preliminary report of the A. C. S. Committee on Economic Status.

Marie Curie Lecture

EMMA PERRY CARR, chairman of the Department of Chemistry, Mt. Holyoke College, will deliver the third annual Marie Curie lecture at the Pennsylvania State College, February 20, 1942, on "Fingerprinting Molecules".

The Marie Curie lectures were inaugurated by Palladium Chapter of Iota Sigma Pi, national honorary chemical society for women, in May 1940 as a memorial to Mme. Curie, an honorary member of the society. The lectures are given each year by some outstanding woman chemist on her work in chemistry and are semipopular.

Dr. Carr has been engaged in research on the ultraviolet absorption characteristics of the simple unsaturated hydrocarbons, data which will lead to a better interpretation of the carbon-carbon double bond of organic chemistry. She was the first recipient of the Garvan Medal, Women's Award in Chemistry, in 1937 and is an honorary member of Iota Sigma Pi.

Films Featured on Program of St. Louis Section

A PREMIERE showing of a Hollywood technicolor production, "Unfinished Rainbows", presented by the Aluminum Co. of America, and still photos using the new additive system of color photography by O. H. Schunk, Prismacolor, Inc., were given before a recent meeting of the St. Louis Section, AMERICAN CHEMICAL SOCIETY. In addition, the regular program consisted of a talk on "Polystyrene" by T. S. Carswell, Monsanto Chemical Co., and two group lectures on "Drying of Granulated Solids" by N. H. Ceaglske, Washington University, and "Marketing Research" by H. E. Thayer, Mallinckrodt Chemical Works.

National Labor Board Decision Upholds Professional Status of Chemists

In a momentous decision handed down on January 13, 1942, the National Labor Relations Board held that professional employees cannot be forced into a heterogeneous bargaining unit sought by a labor union in its negotiations with an employer unless a majority of the professional employees through a vote confined to the professional group express their desire so to be included. The decision of the board was rendered In the Matter of The Shell Development Co. and the International Federation of Architects, Engineers, Chemists, and Technicians, Case No. R-3245, and was unanimous. The controversy was submitted to the board on petition of the F.A.E.C.T. to set up a bargaining unit composed of both professional and nonprofessional employees. The petition was filed after the company and the Union had been unable to agree upon the composition of such a unit for collective bargaining purposes.

Following the filing of the petition for representation by the Union, the National Labor Relations Board ordered a hearing before one of its Trial Examiners. The hearing opened on October 27, 1941, at San Francisco, and concluded on November 4, 1941.

At the commencement of the hearing Vanan C. Irvine, Seaver A. Ballard, H. K. Sutherland, Ahlborn Wheeler, Chester C. Crawford, Kenneth D. Detling, Frederick B. Hilmer, Harold Byck, Donald S. LaFrance, and Clarence L. Dunn, all of whom are professional employees of the Shell Development Co. employed in professional work, filed a motion for permission to intervene in the proceeding. In support of their motion, each of the moving parties represented that he is a chemist employed by the Shell Development Co. and further that his employment is professional employment in the course of which he is engaged upon highly confidential work. Each of the intervenors represented that he had an interest in the proceeding and asked that he be allowed to intervene for the purpose of presenting evidence to show that he and others similarly employed should not be included in a heterogeneous bargaining unit consisting of a miscellaneous group of employees including, *inter alia*, unskilled and skilled laborers and professional men for the purpose of selecting representatives for collective bargaining with the company. Notwithstanding vigorous opposition by counsel for the Union, the motion of the intervenors was granted by the Trial Examiner and thereafter through counsel they presented testimony during the hearing. Following the hearing the entire record was forwarded to the National Labor Relations Board in Washington which ordered an argument upon the contentions of the various parties. The argument was held on December 11, 1941. The company, the petitioning Union, and the intervenors were all represented by counsel at the argument.

Prior to the hearing in San Francisco, the intervening professional workers who are members of the American Chemical Society asked the Society to assist them in their effort to maintain the right of professional men to have their wishes considered in such a proceeding. By direction of the Board of Directors of the Society, Elisha Hanson, its counsel, flew to San Francisco for conference with the intervenors and with Justin M. Jacobs, the attorney who represented the intervenors at the hearing before the Trial Examiner.

When the matter was set for hearing before the board in Washington, Mr. Jacobs, counsel for the intervenors, and the intervenors requested Mr. Hanson to argue the case for the intervenors before the board. This he did. The decision of the board reflects the thorough preparation and presentation of the intervenors' case both in hearing and in argument.

Prior to argument the company, the petitioning Union, and the intervenors each had filed a brief with the board.

In its decision the board pointed out that the Union had conducted negotiations with the company during April and May 1941 for a collective bargaining agreement. These negotiations failed because the parties were unable to agree upon an appropriate bargaining unit. The Union requested a unit composed of all types of employees in the plant, but excluding employees in the administrative department, engineering department, safety inspection department, photographic department, general office department, secretaries-stenographers department, stenographic department, technical files department, and library department, the kitchen staff, executives, the associate director, the assistant directors, and department heads. The company agreed that the unit proposed by the Union was an appropriate unit provided that professional employees were excluded therefrom and that nonprofessional employees in the engineering, safety inspection, and photographic departments should be included in the unit.

The intervenors contended that professional and nonprofessional employees should not be merged into one unit. Thus, when the case came to the board for hearing, the issue was squarely presented as to whether a Union, by reason of having signed up a certain number of employees in a particular plant, could reach out and corral an almost equally large number of employees who had no desire to have that particular Union represent them and arbitrarily exclude from its proposed unit numerous other employees whom it had been unable to interest in its scheme because their inclusion in any voting unit undoubtedly would mean the loss of an election.

The board disposed of the Union's contention by ordering two elections and designating two units for the purpose of the elections. The one unit is composed of all the skilled and unskilled employees in the plant. The other unit is composed of all the professional workers in the plant. Department heads and supervisory employees were excluded from the vote. In thus resolving the issue as it did the board afforded the professional employees an opportunity to express themselves in a group composed entirely of professional employees on the question of union representation for collective bargaining. It laid down the principle that professional employees should not be corralled into a bargaining unit composed of a miscellaneous group of skilled and unskilled workers as well as professional employees.

In its decision the board said:

> Upon the entire record, we find that the professional employees might properly be considered either as a separate unit or as part of a larger unit composed of professional and nonprofessional employees. Under such circumstances, we apply the principle that the determining factor is the desires of the professional employees. We shall therefore direct separate elections in order that we may ascertain the wishes of the professional employees.

Before entering its order the board had previously found as follows:

> The company employs at the plant approximately 200 professional employees, including chemists, junior chemists, physicists, junior physicists, engineers, and junior engineers, as distinguished from nonprofessional employees, such as laboratory assistants, probationary laboratory assistants, laboratory helpers, technicians, engine operators, engine mechanics, experimental plant operators, glass blowers, handymen, roustabouts, warehousemen, glass washers, and janitors.
>
> Research projects are assigned to various research groups. Such groups are usually composed of both professional and nonprofessional employees; sometimes, particularly in the early stages of the work, a group may be composed of professional employees only. The composition of a

given research group may change from time to time, both in number and classification of employees. Professional and nonprofessional employees work together in the laboratory, and the successful completion of a project depends on the ability, productivity, and cooperative efforts of both classes of employees. Each research group usually has a leader, who is generally a chemist, physicist, or engineer, who is the link between the group and a department head. The leader directs and integrates and is responsible for the work of his group. Members of a research group may seek advice and assistance from individuals in other groups and departments.

All but 24 of the professional employees hold college degrees. The 24 who do not hold college degrees are regarded by the company as having had sufficient training and experience with it to merit a professional rating. The nonprofessional employees generally have had at least a high-school training; some of them have had 1 or 2 years of college or junior college work, but very few hold college degrees. The nonprofessional employees usually learn the rudiments of manipulative work in the sciences through their general science courses in high school or college, but for the most part their specialized skill in laboratory work is acquired at the plant.

The professional employees, by reason of their wider educational background and experience, by and large are primarily engaged in the theoretical aspects of research, the planning of solutions to the problems, the correlation of the laboratory data, and the drawing of deductions and conclusions from such data; however, they also frequently do manipulative, mechanical work. The nonprofessional employees by and large are primarily engaged in the manipulative, mechanical aspects of the research project (such as the taking of readings, the running of distillations and filterings, and the making of laboratory analyses); however, they sometimes contribute to the theoretical aspects of the work, draw conclusions from data, and are at times consulted by the professional employees on the feasibility of conducting certain experiments.

The professional employees are generally given their assignments in broad outline and enjoy considerable latitude in performing their functions, while the nonprofessional employees generally receive detailed instructions. Also, the nonprofessional employees are more easily transferable from project to project.

The weekly laboratory reports, which are compilations of data, may be prepared by a professional or nonprofessional member of the research group, but the quarterly research progress reports, in which theories are propounded, conclusions drawn, and prognoses made, are generally written by professional employees only. These reports, as well as patents issued and articles published in scientific journals, bear the names of all employees, professional and nonprofessional, who have participated in the laboratory work covered by the report, patent, or article.

Professional and nonprofessional employees are paid twice a month, their salaries are fixed at a monthly rate, and they enjoy substantially the same vacation privileges. However, the salaries of professional employees generally are higher than those of nonprofessional employees. Also, classes of nonprofessional employees, unlike professional employees, generally have fixed minimum and maximum rates of compensation.

Evidence introduced at the hearing disclosed the range of salary scales as follows:

Classification	Minimum	Maximum
Laboratory helper	$130	No increase until promoted to next highest classification.
Probationary laboratory assistant	$145	No increase until promoted to higher classification.
Laboratory assistant	$160	$195
Technician	$160	$230
Junior chemist	$170 or more	No limit
Chemist (Ph.D.'s start at $245 or more)	Depends on man	No limit

The brief filed by the professional employees who intervened in the proceeding reviewed the hearing thus:

The testimony introduced on the bargaining unit issue consisted of the testimony of eleven witnesses. The only witness called by the Union on that issue was David E. Adelson, a chemist. The company called two witnesses, J. F. M. Taylor, its president, and William E. Vaughan, a department head, both of whom are chemists. The intervenors called: Vanan C. Irvine, a chemist; Frederick B. Hilmer, a chemist; Howard O. Ruliffson, a junior chemist; R. Robert Brattain, a physicist; Seaver A. Ballard, a chemist; Edward B. Wist, an engineer; John R. Griffin, an engineer; and Chester C. Crawford, a chemist.

Over the objection of the intervenors, the Union's witness, David E. Adelson, a chemist, without any foundation whatever, was permitted to testify generally in terms of his opinion and conclusions as to the work done by the 201 professional men and the 203 nonprofessional men included in the heterogeneous unit claimed by the Union. He attempted to show that there was no difference. His testimony was flatly contradicted by the testimony of the company's witnesses, J. F. M. Taylor and William E. Vaughan.

In fact, the Trial Examiner stated that the testimony of the Union witness Adelson had been met by that introduced by the company. He said:

> I think that the company has already met that (Adelson's testimony) in generality.

The intervenors' witnesses (many of whose duties are substantially the same as Adelson's) testified that they could only testify accurately to the work done in their own research groups and departments.

For the purpose of utterly destroying Adelson's generalizations and conclusions, the intervenors attempted and offered to call one witness from every department and from every research group to testify specifically as to the vast differences between the work done by the professional men and that done by the nonprofessional employees in each department and on each research group. The Trial Examiner prevented the intervenors from so doing. He instructed the intervenors to withdraw their witness Chester C. Crawford and not to call other witnesses for that purpose.

In their brief the intervenors pointed out that the board's Exhibits 12 and 16 introduced in the hearing illustrated the heterogeneous nature of the bargaining unit proposed by the Union as follows:

Professional Men	
Chemists	103
Junior chemists	76
Physicists	7
Chemical engineers	1
Engineers	7
Junior engineers	7
Total	201

Nonprofessional Employees	
Janitors	15
Glass washers	4
Window washer	1
Engine operators and mechanics	19
Pilot plant operators	39
Night watchman	1
Various roustabouts, handymen and helpers	7
Laboratory assistants	60
Laboratory helpers	31
Technicians	12
Curator	1
Storekeepers and clerks	6
Glassblowers	5
Glassblowers' helpers	2
Total	203

Fourty-four of the professional men have obtained the degree of doctor of philosophy in their respective scientific fields. All of the professional men (except 24 men who have obtained training in the laboratories of the Company, which the Company believes to be the equivalent of a university training) hold either bachelors, masters, or doctors degrees from accredited universities n their respective scientific fields.

Further in their brief the intervenors made the following representations to the board:

The issue in this proceeding does not involve the question of whether professional men who desire so to do should be permitted to retain their status of individualists for bargaining purposes. The issue is solely one of the compulsory inclusion of professional men in such a heterogeneous group as that here proposed.

The intervenors are neither opposed to nor concerned with collective bargaining for nonprofessional workers. Nor are they opposed to collective bargaining of professional men in professional groups.

The intervenors do, however, strenuously oppose the compulsory inclusion of themselves and other professional men similarly situated in such a heterogeneous bargaining unit as that proposed by the Union in this proceeding.

Intervenors Expressed the Desires of the Overwhelming Majority of Professional Men

The Overwhelming Majority of Professional Men do not Desire the Inclusion of Professional Men in Such a Heterogeneous

Bargaining Unit as That Now Sought by the Union.

The National Labor Relations Board has, by its decisions, indicated that in the determination of what constitutes an appropriate bargaining unit it will give cardinal significance to the desires of the employees affected by the proposed bargaining unit.

Matter of General Electric Co. and Pattern Makers' League of North America (1941), 29 N.L.R.B., No. 29, pages 4, 5, and 6.

Matter of Philadelphia Inquirer Co. and Newspaper Guild of Philadelphia and Camden (1941), 31 N.L.R.B., No. 7, pages 8 and 9.

For the purpose of advising the board of the desires of the professional men, the intervenors obtained and offered in evidence the affidavits of 129 professional men (none of whom is a department head or managerial employee) in the Emeryville plant of Shell Development Co., Inc.

Each affiant stated under oath:

That his said employment is professional employment, in the course of which he is engaged upon highly confidential work.

That he is opposed to the designation of any heterogeneous bargaining unit which would consist of a miscellaneous group of employees, including, *inter alia*, unskilled and skilled laborers and professional men, for the purpose of selecting representatives for collective bargaining with Shell Development Co., Inc.

Each affiant petitioned the board to exclude the professional men from the proposed heterogeneous bargaining unit, as follows:

That he respectfully requests the National Labor Relations Board to exclude himself and all other professional employees, including junior chemists, chemists, junior physicists, physicists, junior engineers and engineers, from any bargaining unit that may be designated in the above-entitled proceeding.

The Trial Examiner excluded these affidavits from evidence on the ground that evidence of the desires of individual employees was immaterial to the issue.

The rulings of the Trial Examiner were manifestly erroneous.

He permitted the Union to express its desires.

He permitted the company to express its desires.

Yet he attempted to prevent the men who are, of necessity, most vitally concerned from expressing their desires.

The Trial Examiner sought to justify his ruling on the ground that the evidence was in effect an election from the witness stand to determine whether a majority of the employees desired the *petitioning union*. He said:

Well, there is only one union asking for this unit. In effect, it becomes an election, whether or not they want this union. If there were several labor organisations acting for different units it might be somewhat different.

On the contrary, the evidence was addressed to a much more basic proposition. It was addressed to the question:

Do the professional men want this unit?

It is inconceivable that this board would not be vitally interested in the desires of a distinct group of men on that question. Indeed, in this particular case, where the Union seeks to merge two wholly separate and distinct groups of employees into a single heterogeneous unit, the fact that an overwhelming majority of one of those groups does not desire its inclusion should be the controlling factor.

There are many professional men, in addition to the 129 whose affidavits were offered in evidence, who are opposed to the inclusion of professional men in the proposed unit.

The intervenors attempted to prove through Seaver A. Ballard that a minimum of 150 and a maximum of approximately 180 professional men were opposed to the proposed heterogeneous unit. The evidence was excluded, whereupon the intervenors made the following offer of proof:

MR. JACOBS. I offer to prove by this witness that a minimum of 150 and a maximum of approximately 180 of the professional men in the employ of the Shell Development Co.—and by that term I mean to include chemists, junior chemists, physicists, junior physicists, engineers, and junior engineers—are opposed to the heterogeneous bargaining unit that is proposed by the union in this proceeding.

Do I understand, Mr. Examiner, by your ruling that I will not be permitted to make that showing through this witness?

TRIAL EXAMINER WHITTEMORE. That is correct.

In sharp contrast to the showing made by the intervenors, there is not a particle of evidence to show that any of the professional men (other than Dr. Adelson) desire such a unit as that now proposed.

Indeed, there is absolutely nothing to show that anyone desires the heterogeneous unit except the officers of the petitioning union.

The intervenors in their brief also pointed out that it was manifest that there were two basic and inherent defects in the unit.

First, the attempted exclusion of a portion of the nonprofessional employees and the inclusion of the balance; likewise, the exclusion of a portion of the professional employees and the attempted inclusion of the balance. In each case there is no sound basis for distinction between those attempted to be included and those attempted to be excluded.

Second, the attempt to disregard the fundamental differences between, and to merge into one heterogeneous unit, the professional men on the one hand and the nonprofessional men on the other hand, which, of necessity, must and do constitute two wholly separate and distinct groups.

The intervenors are more vitally affected by the second defect and we intend to devote this brief primarily to that defect.

In passing, however, and by way of specific example of the first defect, we call to the board's attention:

The testimony of Edward B Wist, an engineer whom the Union seeks to *exclude;* and

The testimony of John R. Griffin, an engineer whom the Union seeks to *include.*

Mr. Wist is an engineer who holds both a degree of bachelor of arts and a degree of mechanical engineer from Stanford University, obtained as a result of six years' study in engineering. He is an engineer in charge of construction and design work in the "pilot" plant at Emeryville. His duties consist of the design and construction of equipment to be used in the "pilot" plant in connection with the experimentation done in the "pilot" plant on projects initiated and partially completed in the laboratories.

Mr. Griffin is an engineer who obtained a bachelor of science degree and a master of science degree in mechanical engineering from the University of California as a result of six years' study in engineering. He is engaged in the problem of testing aircraft engine lubricants and in devising a suitable test procedure for that purpose.

The testimony of these two engineers shows conclusively that there is absolutely no basis for distinction between their training or the character of work which they do; that both of them are engaged in professional work, and that the attempted inclusion of the one and the exclusion of the other by the Union is purely arbitrary.

However, since it is our position that all professional men should be excluded, we shall leave any further discussion of the first defect to the other parties to this proceeding.

The Professional Group Includes the Chemists, Junior Chemists, Physicists, Engineers, and Junior Engineers

Although the Union's attorney at the hearing professed ignorance at what is meant by the term "professional group", there is no uncertainty as to what employees of the company are professional men as distinguished from nonprofessional workers.

From an examination of the decisions which we have cited and quoted below and the definitions contained in the various dictionaries, it appears that the term "professional" means:

An individual who has acquired knowledge of an advanced type in a field of science or learning customarily acquired by a prolonged course of specialized intellectual instruction and study as distinguished from:

(*a*) a general academic education, or

(*b*) an apprenticeship, or

(*c*) a training in the performance of routine mental, manual, and physical processes, and who applies his knowledge in work that is predominantly intellectual and varied in character as distinguished from routine mental, manual, mechanical, or physical work, whose work requires the constant exercise of discretion and judgment in its performance, whose work is predominantly original and creative in character in the field of his science or learning, and is of such a character that the result accomplished by his work cannot be standardized in relation to a given period of time.

United States v. Laws, 163 U. S. 258, 41 L. Ed. 151;

Cummins v. Pa. Fire Ins. Co., 134 N. W. 79 at 82;

Ex parte Aird, 276 Fed. 954;

Mayor and City Council of Baltimore v. Smith, 177 Atl. 903;

State v. Cohn, 165 So. 449;

People v. State Tax Commission, 26 N. E. (2d) 955, 957.

The United States Supreme Court, in United States *v.* Laws, supra, held:

1. A chemist employed on a sugar plantation in Louisiana was a professional man engaged in the practice of his profession;

2. Such a chemist was a professional man engaged in the practice of his profession:

(*a*) notwithstanding the fact that he limited his practice to the specialised field of chemistry connected with the manufacture of sugar; and

(*b*) notwithstanding the fact that he limited his practice to one employer.

The Supreme Court said (41 L. Ed. 155):

The chemist who places his knowledge acquired from a study of the science to the use of others as he may be employed by them, and as a vocation for the purpose of his own maintenance, must certainly be regarded as one engaged in the practice of a profession which is generally recognized in this country * * * *

It may be assumed that the branch of chemistry which he (the chemist) will practice will be that which relates to and is connected with the proper manufacture of sugar from the sugar cane, or possibly from sorghum or beets. *He is none the less a chemist, and none the less occupied in the practice of his profession because he thus limits himself to that particular branch, which is to be applied in the course of scientific manufacture of sugar* any more than a lawyer would cease to practice his profession by limiting himself to any particular branch thereof or a doctor by confining his practice to some specialty which he particularly favored and was eminent in.

* * * * *

The fact that the individual in question, by this contract, had agreed to sell his time, labor, and skill to one employer, and in one prescribed branch of the science, does not in the least militate against his being a professional chemist, nor does it operate as a bar to the claim that while so employed he is nevertheless practicing a recognized profession. It is not necessary that he should offer his services to the public at large nor that he should hold himself ready to apply his scientific knowledge and skill to the business of all persons who applied for them before he would be entitled to claim that he belonged to and was actually practicing a recognized profession * * * * So long as he is engaged in the practical application of his knowledge of the science, as a vocation, it is not important whether he holds himself out as ready to make that application in behalf of all persons who desire it, or that he contracts to do it for some particular employer and at some named place.

Manifestly, the considerations which caused the United States Supreme Court to hold that a *chemist* actively engaged in a particular branch of chemistry is a professional man engaged in the practice of his profession would require the same conclusion with respect to a physicist engaged in the application of his specialized knowledge in the performance of his work.

In ***Ex parte Aird***, supra, the District Court of the United States held that an *engineer* engaged in the practice of engineering is a professional man engaged in the practice of his profession. In that case the engineer was employed by Bethlehem Shipbuilding Corp. and was required to apply learning and skill in marine engineering in performing his work of designing marine turbine engines and auxiliary machinery connected with them. The court held that he was engaged in "a recognized learned profession". The Court said (276 Fed. 958):

It is clear that the relator, in the employment he entered this country to perform, was not engaged in labor, skilled or unskilled, within the accepted meaning of those words. *He was a "brain toiler"; his work required technical training, skill, and learning in various branches of science. What he did, he did not perform with his hands or mercly as a skilled mechanic would through application of mere mechanical skil.* His employment, in designing marine turbine engines or auxiliary machinery connected with them, is one in which the planning and working out of the details must be originated in the mind of the designer.

The fact that a professional man may perform some manual or mechanical work obviously does not change his status from a professional to a nonprofessional. The Court of Appeals of Maryland so held in Mayor and City Council of Baltimore *v.* Smith, supra, where, in answer to an argument that the duties of a professional nurse required the performance of such manual work as cleaning tables, chairs, and other articles for use in the wards and the preparation of beds for patients, the Court said (177 Atl. 905):

The answer to this is that the manual labor mentioned is simply incidental to the profession of nursing and does not destroy its principal and essential quality, which is the special and professional knowledge, technical skill, and experience that comes from the instruction, training, and exercising of the nurse's mental faculties.

The same rule was applied in State *v.* Cohn, supra, where the Court, after quoting and considering various dictionary definitions and decisions quoted in its opinion, at page 452 said:

The test as stated by the foregoing definitions and authorities is whether or not the intellectual quality predominates over manual skill in performing the duties of the particular calling. *If the mental aspect is controlling, then the pursuit is classified as a profession. If skill in the manipulation of the hands, tools, and machinery is emphasised over the mental side, then the calling is classified as a mechanical pursuit.*

From the decisions which we have quoted and cited above (and we have found none to the contrary), it clearly appears that chemistry, physics, and engineering are all professions and that men who have acquired an advanced learning in those professions and apply their learning in their work are professional men engaged in the practice of their respective professions.

The Uncontradicted Evidence Conclusively Shows That the Chemists, Physicists, Engineers, Junior Chemists, and Junior Engineers Are Professional Men Engaged in the Practice of Their Professions

The witnesses of all parties, without contradiction or conflict, each testified that he had acquired an advanced knowledge of his particular science by a prolonged course of specialized intellectual instruction and study: Vanan C. Irvine, a chemist, called as an intervenors' witness, so testified; Frederick B. Hilmer, a chemist, called as an intervenors' witness, so testified; Howard O. Ruliffson, a junior chemist, called as an intervenors' witness, so testified; R. Robert Brattain, a physicist, called as an intervenors' witness, so testified; Seaver A. Ballard, a chemist, called as an intervenors' witness, so testified; Edward B. Wist, an engineer, called as an intervenors' witness, so testified; and John R. Griffin, an engineer, called as an intervenors' witness, so testified.

David E. Adelson, a chemist, called as the Union's witness, so testified.

All of these witnesses, without contradiction or conflict, testified to facts which show that their work is professional work in that it is predominantly intellectual and varied in character as distinguished from routine, mental, manual, mechanical, or physical work; in that it requires the constant exercise of discretion and judgment in its performance; in that it is predominantly original and creative in character in the fields of their respective sciences, and in that it is impossible for them to determine at the time a project is assigned to them when the solution of that project may be realized.

Even David E. Adelson, a chemist, the Union's witness and the international vice president of the Union, on cross-examination testified:

Q. (by Mr. Jacobs) Dr. Adelson, is it not a fact that your work is predominantly intellectual as distinguished from manual work?

(Objection by Mr. Leonard)

A. In the sense that my work is embracive of such things as correlation, planning, and writing reports, I would assume that the major portion of my time is devoted to intellectual pursuits. I certainly wouldn't want to go on record to the contrary.

Q. (by Mr. Jacobs) I wouldn't think so, Doctor. Is it not a fact, Doctor, that your work is varied in character so that the problem, the specific problem on which you may be working today in a specific field, may be different from a problem on which you are working, a specific problem, say, a week from now? In other words, isn't your work of a varied nature within the realm of chemistry?

A. Naturally, my work varies as the products and processes that we concern ourselves with change from time to time; but the basic method of attack is essentially the same. We have certain tools with which we pry into the unknown problems and they are applied to a more or less degree in the various problems we concern ourselves with.

Q. (by Mr. Jacobs) Exactly. In prying into these unknown problems you fall back on all of the training and experience that you have gained in your former education and in your past experience, don't you, in attempting to find an answer to those unknown problems?

A. Yes. I fall back on that. I also fall back on the experience and training of the other members of my team.

Q. Surely. Your work, Doctor, requires a constant exercise of discretion and judgment, does it not?

A. Yes.

Q. When you have a problem presented to you, Doctor, at the time it is presented to you can you normally tell when the answer is going to be found, or will that period of time vary with a great deal of elasticity due to the nature of the problem?

A. That will vary over a complete range of time.

Q. From an hour up to a year or something like that, depending on the problem?

A. And you may never solve it.

Q. Right. The work that you do, Doctor, requires the knowledge, the advanced knowledge in chemistry that you have obtained in your formal education and your past experience, does it not?

A. Yes, it does.

Q. And normally a person could not acquire your knowledge and background without spending a good deal of time in study and training, could he?

A. If you include by that, the experience, I think that is essentially correct.

Q. The purpose of your work, Doctor, is for you to produce original and creative ideas, is it not, in the attempt to solve these unknown problems?

A. That is one function.

The intervenors also pointed out the sharp distinction between the education and training of the professional men as a group and the nonprofessional men as a group. Then the intervenors called the attention of the board to the fact that in previous controversies before it, it had excluded professional men from proposed heterogeneous bargaining units. In conclusion the intervenors pointed out that professional men are supervisory employees, whereas nonprofessional workers in the unit proposed were not; that professional men make recommendations with respect to promotions; that the work of professional men is highly confidential; that there is a radical difference in the compensation of the professional group on the one hand and the nonprofessional group on the other; that professional men within a given classification are not readily interchangeable, whereas nonprofessional men within a given classification are readily interchangeable, and finally that the proposed bargaining unit would not be advantageous to any of the employees.

In its brief filed with the board prior to argument the Union claimed its right to select a unit in such a manner as to assure it of success in the election which it sought from the board. The position of the Union in respect of its claim to representation was as follows:

The petitioner commenced to organize respondent's employees at least as early as 1938. By October of 1940, petitioner had so well organized all of the employees in the maintenance department that a memorandum agreement concerning the wages, hours, and working conditions of those employees was entered into between petitioner and respondent. At this time also petitioner had other classifications of employees, including so-called "professionals" among its members. It did not bargain for them because it had not reached that degree of strength which justified its so doing as a matter of trade union strategy. Shortly thereafter, petitioner attempted to bargain collectively with respondent for certain other classifications of workers, but no agreement was reached because of a controversy concerning the appropriate bargaining unit. In the meantime, organizational activity throughout respondent's plant continued and by April of 1941, petitioner requested the right to bargain for all of the respondent's employees in the unit as set forth in the amended petition on file herein. There were negotiations between respondent and petitioner during the months of April and May 1941 but they broke down upon the question of unit. The petitioner contended for the unit set out in the amended petition, while the respondent, asserting that certain classifications of its employees were unfit for collective bargaining, desired to have them excluded from the unit. Furthermore, despite the fact that other unions, both AFL and CIO, had jurisdiction over certain departments which had not therefore been organized by petitioner, and were not sought to be represented by it, the company attempted to inject itself into this matter by insisting that workers in those departments be included within the unit. For these various reasons, at least, negotiations did not result in any agreement and the question concerning representation arose.

* * * *

As was pointed out by the intervenors in their brief, there was no evidence in the record that any professional employee other than Dr. Adelson belonged to the petitioning Union or wanted the Union to represent it in collective bargaining. There was the tender of proof by the intervenors that by far the greater majority of professional employees did not want to have the Union designated as their representative for collective bargaining and further that they did not want to be included in a unit made up of a miscellaneous group of employees and so constituted through the process of Union section as to ensure the Union a majority in any vote ordered.

While the board in earlier decisions had granted professional employees the right to express their choice in the matter of bargaining units, the decision in the Shell Development case goes further than any prior decision of the board in establishing the right of professionals to self-expression within their group.

BRITAIN counts on the United States for phosphatic fertilizers, essential in the expansion of cultivated land in that country for war needs. Increased production by British sources of nitrogenous fertilizers and of lime is anticipated.

THE United States and Canada have been the sources for Cuban imports of calcium carbide, of which the country took 2,038 metric tons valued at $98,352 in 1940 and 2,265 tons at $98,981 in 1939.

Solvent Recovery Unit at Koroseal Plant

What is believed the largest solvent recovery unit in the Akron area is being operated by The B. F. Goodrich Co. at its recently opened Koroseal spreading plant. The photograph shows the three towers comprising the unit. The largest, right, is 10 feet in diameter, 78 feet high, and weighs 130,000 pounds. The center is 6 feet, 6 inches in diameter, 68 feet high, and 51,000 pounds in weight, while the smallest is 2 feet, 6 inches in diameter, 54 feet high, and weighs 12,000 pounds. All of the towers were received on the site completely assembled and were erected in one piece.

Advances in Botany

THOMAS G. PHILLIPS
The University of New Hampshire, Durham, N. H.

INTEREST continues in the organic acids which appear to be concerned in the intermediary metabolism of plants. Pucher and Vickery (*39*), of the Agricultural Experiment Station at New Haven, have determined the distribution of succinic acid in the tobacco plant at various stages of its development. The amounts found were small, but the variations recorded would appear to show that this acid is one of the more active metabolites of plant tissue.

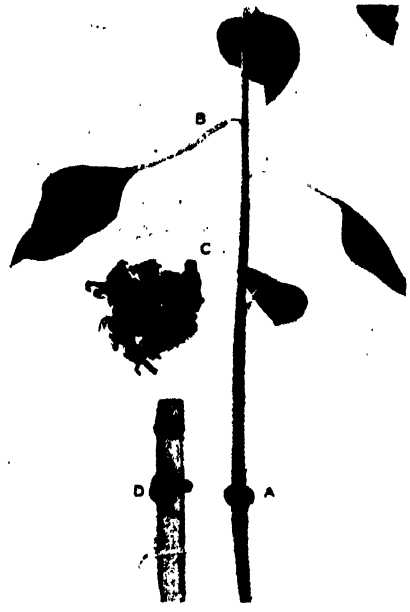
Damodaran and Venkatesan (*8*) have shown the presence of succinoxidase in many plant parts, though it does not appear to occur universally. Its occurrence in parts in which asparagin formation is active would indicate that the change it catalyzes, succinic acid to fumaric acid, may take part in the plant's amide metabolism.

James *et al.* (*22*), of Oxford University, tested cell-free barley saps under aseptic conditions with various additions. Their results indicated a formation of pyruvic acid from glucose through a phosphorylation cycle similar in outline to the reactions of yeast.

Virtanen *et al.* (*60*) determined oxalacetic acid in various legumes. Samples taken at midday contained 30 to 100 micrograms per gram fresh weight. If the samples were stored in the dark, amounts of the acid decreased below limits of the analytical method, which was 10 micrograms per gram.

On growing excised barley roots in nutrient media, Ulrich (*58*), of the University of California, found that, when cations were absorbed in excess of anions, organic acids increased markedly, provided carbohydrates were available. When anions were absorbed in excess, organic acids decreased rapidly. Changes in the respiratory quotient paralleled these changes. This balancing mechanism was not associated with changes in the NH_3 or amides present.

Hanes (*16*), in England, prepared a phosphorylase from potato tubers. It catalyzed both the formation of starch from glucose-1-phosphate and the reverse reaction. Unlike natural starch, that formed by this synthesis was almost completely hydrolyzed by β-malt amylase. Since this starch on methylation and hydrolysis yielded no tetramethylglucose, which would measure end groups, Hassid and McCready (*17*), University of California, concluded that the chains of glucose molecules must either be extremely long, so that the end groups escape detection, or exist in the form of continuous loops. Green and Stumpf (*15*), of Harvard, greatly concentrated the potato phosphorylase preparation. A catalytic amount of starch or dextrin must be present for synthesis to occur. The starch synthesized in the reaction cannot serve this purpose.



In a continuation of studies mentioned in a previous review (*36*), Miller (*31*), of the Boyce Thompson Institute, exposed gladiolus corms alternately to ethylene chlorohydrin and *o*-chlorophenol. The former appeared in the plant tissue as its β-*d*-glucoside, the latter as its β-gentiobioside. The sugar combined with the foreign compound appears to depend on the nature of the compound and also on the species of plant, since chloral hydrate and similar compounds are combined with gentiobiose by the tomato plant and by gladiolus corms, but with glucose by a species of gourd.

When Dawson (*9*), University of Missouri, grafted scions of tomato on tobacco stocks, the resulting tomato plants contained appreciable amounts of nicotine, which is not normally present. If tobacco was grafted on tomato, no increase in nicotine occurred in the tobacco plant. The author concluded that the nicotine synthesizing mechanism must be located in the roots of the tobacco plant.

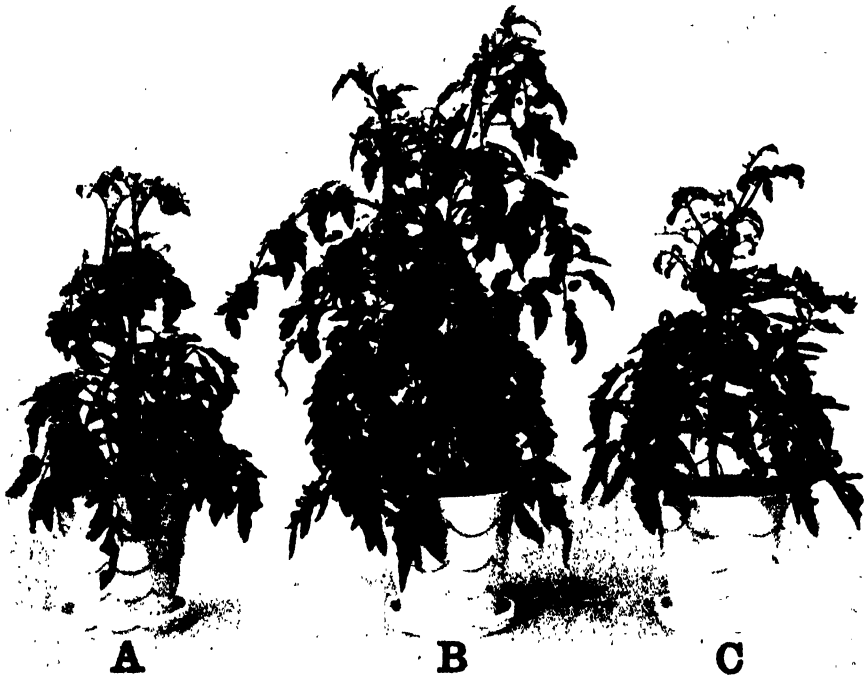
Science Supplement (*51*) has noted a report from the U. S. Department of Agriculture that *Nicotiana rustica*, a half-wild cousin of ordinary tobacco, is extremely rich in nicotine and nicotinic acid and may provide an important commercial source of these valuable chemicals.

Last year Kertesz *et al.* (*24*), of the New York State Agricultural Experiment Station, described the use of calcium chloride for increasing the firmness of canned whole tomatoes. The improvement has (*27*) been shown to be caused by formation of calcium pectate in the tissues of the fruit.

A fungus, *Phytophthora cactorum*, causes a wilt of many plants and bleeding canker of hardwood trees, apparently due to a filtrable toxin produced by the fungus. As an effective antidote for this toxin in culture solutions, Howard (*20*), of Rhode Island State College, has used the dihydrochloride of diaminoazobenzene with Helione orange as a solvent and penetrant. Some hundreds of trees naturally infected with the disease have been injected with the antidoting solution. A marked improvement in the condition of these trees has been noted.

J. A. CARLILE

Crown-gall production by bacteria-free tumor tissues. *A.* Primary tumor from inoculation of sunflower with gall-producing bacterium. Bacteria can usually be recovered from these tumors. *B.* "Metastic" secondary tumors in petiole of the fourth leaf above point of inoculation, usually but not always free of bacteria. *C.* Tissue culture made of cells from the interior of secondary tumor grown through 10 passages in vitro. Only such cultures as are demonstrably bacteria-free in the first passage are maintained. *D.* A tumor produced by grafting a culture like C into the stem of a healthy plant, resulting in a typical crown-gall tumor, free of bacteria by all the tests so far applied.



Published by permission of Philip R. White and Armin C. Braun, Rockefeller Institute for Medical Research.

Isotopes

In a study of the action of heavy metals on plants, Mazia and Mullins (*28*), Universities of Missouri and Rochester, placed leaves of the water plant, *Elodea canadensis*, in very dilute solution of the chloride of radioactive Cu^{++}. A large proportion of the Cu^{++} accumulated in the leaves in a form not removed by water. The active Cu^{++} in the leaves exchanged with ordinary Cu^{++} and with Au^{++}, but not with ions of the alkali metals.

Radioactive phosphorus was detected by Arnon *et al.* (*2*), University of California, in the tips of tomato plants 6 feet high 40 minutes after it was supplied to the roots. The phosphorus was found in both seeds and pulp of green fruit, but only in the pulp of ripe fruit. If the phosphorus supply was restricted, the fruit drew upon the supply in the leaves.

When Biddulph (*4*), of Washington

These plants were grown for 42 days in quartz sand supplied with a complete culture solution. Then all were continued 16 days: *A* without boron but with optimum calcium in the culture solution; control *B* as before; and *C* with optimum boron but deficient calcium. The visible symptoms of the boron deficiency in *A* are identical with symptoms of calcium deficiency in *C*. The so-called boron deficiency symptoms in *A* apparently also represent calcium deficiency symptoms since it has been found that calcium does not function effectively in the plant in the absence of boron.

State College, injected radioactive phosphorus compounds into leaves of bean plants, they migrated down the plant much more rapidly than up. The rate of migration toward the top varied with light, but the two maxima did not coincide.

Hevesy *et al.* (*18*) supplied ammonium sulfate containing N^{15} to sunflower plants after the lower leaves were formed. The plants were analyzed after two or three more pairs of leaves had developed. The older leaves had not grown appreciably, but 12 per cent of their protein nitrogen had been replaced by N^{15}. They concluded that there is considerable hydrolysis and synthesis of proteins, and exchange of materials between old and new leaves.

Burris and Miller (*7*), Columbia University, grew the free-living nitrogen-fixing organism, *Azotobacter vinelandii*, in an atmosphere enriched with N^{15}. No selective action between the isotopes was apparent in the fixing of nitrogen, and there was no evidence of exchange between molecular nitrogen and the nitrogen fixed in the culture.

Burris (*6*) also was unable to detect fixation of N^{15} by sterile cultures of barley, red clover, germinating pea seeds, excised root nodules, or root nodule bacteria in absence of the host plant. Red clover infected with *Rhizobium trifolii* fixed N^{15} abundantly.

Cultures of the single-celled green alga, *Chlorella*, were grown by Ruben *et al.* (*47*), University of California, in water containing 0.85 per cent O^{18} buffered with ordinary potassium bicarbonate and potassium carbonate. On exposure to light the oxygen evolved in photosynthesis had the same isotopic composition as that in the water. It was concluded that the oxygen came entirely from the water and that, when respiration and photosynthesis went on in the presence of O^{18}, no exchange reactions involving molecular oxygen occurred.

Smith and Cowie (*53*), of the Carnegie Institution, exposed leaves of sunflower plants to carbon dioxide containing radioactive carbon. In the dark carbon dioxide was absorbed in the three forms usually mentioned—in solution in the cell sap, by reaction with the buffer system, and as an insoluble carbonate, presumably of calcium. Additional carbon dioxide was fixed in a noncarbonate derivative of which little is known. On illumination this absorbed carbon dioxide could be used in photosynthesis. This newly formed photosynthate was used quite rapidly in respiration.

Frenkel (*14*), University of California, used *Nitella* cells in a study of this apparently organic form in which carbon dioxide is fixed in the dark. With these cells the cytoplasm and vacuolar sap can be separated from the chloroplasts, and each part examined separately for radioactivity. After exposure to carbon dioxide in the dark the reduced carbon was entirely in the cytoplasm and vacuolar sap. After exposure in the light the chloroplasts contained the greater proportion of the fixed carbon. Intact cells were essential to the dark fixation of carbon dioxide as well as to photosynthesis.

This organic compound formed by the fixation and at least partial reduction of carbon dioxide in the dark has been investigated further by Ruben and his associates (*44*, *45*, *46*). Experiments with the ultracentrifuge indicated that its molecular weight is about 4 times that of sucrose. Diffusion tests led to a minimum value of about 1,000. The carbon dioxide fixed appeared to be entirely in the carboxyl group of this compound. It was suggested that the formation of this compound may be similar to the introduction of carboxyl into catechol or pyrogallol when treated with carbonates under

Calcium-treated canned tomatoes, firm enough for use whole, sliced, or halved in salads

Canned tomatoes 10 minutes after the can was opened. At left is the control. At right, those canned with the permitted amount (0.07 per cent) of calcium chloride.

proper conditions. The authors suggested also that reduction of carbon dioxide may be a very general reaction in living cells. This has been shown to occur in cultures of certain bacteria, and by Evans and Slotin (*13*), University of Chicago, in minced pigeon's liver supplied with pyruvic acid. In these cases, however, the organic compounds of which the fixed carbon became a part were relatively simple propionic acid and oxalacetic acid.

In the presence of chlorophyll and light, photochemical reduction of the carboxyl to alcohol may occur. Successive reactions of this kind could produce long chains from which sugar molecules might split off. Thus no simple intermediate compound would be involved in photosynthesis.

Using cultures of a diatom, Dutton and Manning (*11*), of the University of Wisconsin, measured the quantum efficiency of photosynthesis in lights of different wave lengths. In the shorter visible region, where the carotenoids caused a large proportion of the total absorption, the efficiency was so high that the light absorbed by the chlorophyll could not possibly account for the result. It was concluded that light energy absorbed by the carotenoids may be used in photosynthesis.

Minerals

The possible role of molybdenum as a plant nutrient has received attention recently. Oats grown by Piper (*37*) without this element showed some necrotic areas on their leaves at about the time the panicles emerged. The panicles developed normally, but the grain consisted entirely of empty husks. To allow normal seed formation, 0.02 mg. of molybdenum per liter of nutrient solution was more than sufficient.

Certain blue-green algae fix nitrogen when growing photosynthetically in mineral salt solution. According to Bortels (*5*), salts of molybdenum accelerated this nitrogen fixation markedly. A similar but much smaller effect was caused by salts of tungsten and vanadium.

Hoagland (*19*), University of California, grew plum seedlings in water cultures. There was evidence of deficiency symptoms for both molybdenum and copper.

With cultures of *Lemna* as experimental material, Steinberg (*57*) found that molybdenum, iron, manganese, boron, gallium, and probably copper are essential.

Richards (*40*), of Imperial College, London, was able to increase greatly the growth of young barley plants suffering from potassium deficiency by supplying them with small amounts of rubidium. Larger amounts of rubidium caused abnormalities. The effect appeared to depend on the Ca-NH_4 status of the plant and on its phosphorus supply. Lithium, sodium, and cesium did not have the same effect as rubidium.

Shive (*52*), of the New Jersey Agricultural Experiment Station, has emphasized the reciprocal relations of minerals. The amounts of iron and manganese supplied to plants are not so important as their relative amounts. Thus, symptoms of iron deficiency may also be those of manganese toxicity and vice versa. Symptoms of boron deficiency are much like those of calcium deficiency, and there is a close proportionality between the amounts of soluble boron and soluble calcium in plants.

Biologically Active Substances

Spoiled sweet clover hay causes a hemorrhagic disease in animals. As the result of a long series of experiments by Link and his associates (*55*), at the University of Wisconsin, the active agent has been isolated, identified, and synthesized. It is 3,3'-methylenebis (4-hydroxycoumarin).

English (*12*), at Yale University, has synthesized several compounds similar in structure to traumatic acid, the plant wound hormone, Δ^1-decene-1,10-dicarboxylic acid.. They included Δ^5-undecene-1,11-dicarboxylic acid, $\Delta^{1,7}$-octadiene-1,8-dicarboxylic acid, and several each of the types $HOOC(CH_2)_nCH{=}CHCOOH$ and $HOOC(CH_2)_nCH{=}CH{-}CH_2COOH$. All proved to be active wound hormones, more active than the corresponding saturated compounds.

Mitchell *et al.* (*32*), of the University of Texas, have extracted from spinach leaves and concentrated to a high degree of purity a substance which is essential to the growth of certain lactic acid bacteria. In microbiological tests a concentration of 0.00012 microgram per milliliter gave about one-half maximum growth. The substance contains nitrogen, but no sulfur or phosphorus. It appears to be widely distributed, and is especially abundant in yeast and mushrooms. Since they prepared the substance from leaves, the authors proposed the name "folic" acid for it. There was some evidence that it may have vitamin-like properties for animals.

Hutchings *et al.* (*21*), University of Wisconsin, prepared a similar substance from yeast. An acid which also contains an amine group, it is probably a growth requirement for chicks as well as for lactic acid bacteria. These authors objected to folic acid as a name for this substance, since it is quite general in its distribution and was first isolated from yeast. They preferred to delay naming the substance until its identity is established.

In studies of artificial parthenogenesis it was necessary to grow young embryos of the plant *Datura* in vitro. Moderately young embryos grew well on a standard culture medium to which known growth-promoting substances had been added. For the growth of very young embryos (14 days) Van Overbeek, Conklin, and Blakeslee (*59*), California Institute of Technology and Carnegie Institution, found the addition of coconut milk satisfactory. Search for the active substance is in progress.

White and Braun (*61*), of the Rockefeller Institute, have grown bacteria-free secondary crown galls in vitro aseptically through 13 transfers with a theoretical increase in volume of about 450,000 times. After 10 transfers some of these growths were grafted to normal healthy sunflower plants where they grew well and produced galls. No doubt the stimulation to tumor growth came from bacteria in the primary gall, but it was maintained in extensive reproduction of sterile tissue.

p-Aminobenzoic acid nullifies the effect of sulfanilamide on the growth of bacteria. The experiments of Wiedling (*62*), in Sweden, have shown that it has a similar effect on an autotrophic plant, a fresh water diatom. The author believes that this substance may be of universal significance in the growth of plants.

Miss Day (*10*), of Smith College, has found vitamin B_6 (pyridoxine) of distinct benefit in the growth of excised tomato roots in an agar medium. Neither glu-

tamic acid nor glycine in the amounts used was able to replace it.

According to *Science Supplement* (*50*), the ether extract of corn pollen, tested by Mitchell and Whitehead of the U. S. Department of Agriculture, was extremely active in promoting plant growth. As this extract was a complex mixture, the effective substance must be by far the most active growth promoter yet found.

Field results indicate quite definitely that the growth of peach seedlings is inhibited by the presence of roots of peach trees in the soil. Proebsting and Gilmore (*38*), University of California, growing peach seedlings in sand cultures, found the alcoholic extract of the bark of peach tree roots toxic. The active substances have not yet been identified.

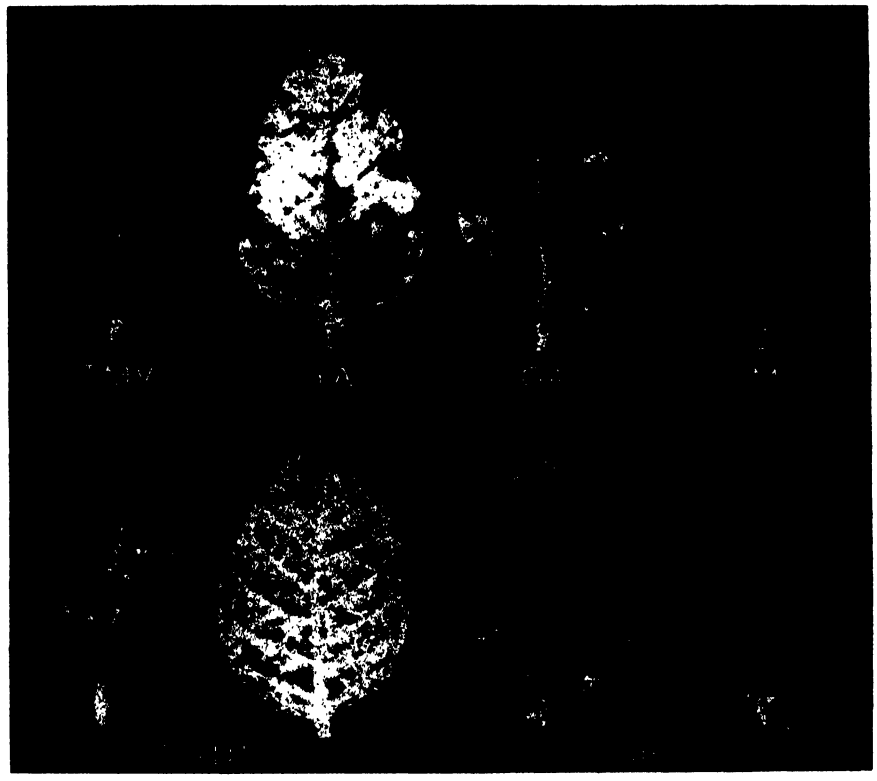
Miller and his associates (*33*, *34*), Michigan State College, have developed a large-scale laboratory method for separating the unsaponifiable lipid material from alfalfa leaf meal. The concentrate contained 60,000 units of vitamin A per gram (as β-carotene) and apparently a natural stabilizer which protects the carotene from oxidation. On irradiation high antirachitic activity was developed without appreciably affecting the carotene.

Viruses

Spencer (*54*), of the Rockefeller Institute, has tried the effect of varying levels of nitrogen supply to the host plant on development of the virus infecting it. From the 5th to the 12th day after inoculation the virus content of the low-nitrogen plants increased to 20 times its original value, that of high-nitrogen plants to 200 times. The latter plants were 2 to 3 times as large as the former.

Ten days after inoculation external nitrogen was withheld from part of a group of plants. After 16 days virus protein and soluble leaf protein in these plants were unchanged in amount, while in the plants supplied with nitrogen, both had increased fivefold. A certain degree of independence in the metabolism of host and pathogen was shown by the fact that, even when starved for nitrogen compounds, neither could make use of the protein of the other but both required external sources of nitrogen for the formation of new protein.

Bawden and Pirie (*5*), of Rothamstead and Cambridge, studied the effect of urea on four viruses. All were irreversibly denatured, with loss of infectivity and serological activity. For each there was a critical concentration of urea below which no irreversible effect on infectivity occurred. Urea inactivation of the tobacco mosaic and tomato bushy stunt viruses was accompanied by the separation of the protein and nucleic acid, but this did not occur with the potato *x* and tobacco necrosis viruses.



The effect of sodium hydroxide on tobacco mosaic virus was complex. Very mild treatment increased infectivity. If the treatment was slightly more severe, infectivity was lost but serological activity remained. More severe treatment destroyed all characteristic properties. In the presence of alkali, sodium dodecylsulfate destroyed the virus, separating the nucleic acid from the protein.

Lauffer and Dow (*26*), of the Rockefeller Institute and Pennsylvania State College, denatured tobacco mosaic virus by high pressure. Inactivation was more rapid than coagulation. The inactivated but not coagulated material contained particles with sedimentation constants much lower than those of the normal virus. The nucleic acid was largely liberated by denaturing, as the coagulum contained very little phosphorus.

By treating with sodium hydroxide at low temperature, Pfankuch (*35*) split the giant molecule of the tobacco mosaic virus into 50 to 100 pieces of comparable constitution. He stated that the high-molecular nucleoproteins may have two types of arrangement: (1) The huge protein molecule has nucleic acid groups attached to it as side chains; (2) protein and nucleic acid units alternate. He considered the former characteristic of enzymes, the latter of viruses.

To test this point, Schramm (*48*), Berlin Dahlem, used a nucleotidase prepared from calf intestinal mucosa to split the virus molecule. The nucleic acid was completely removed without apparent change in the protein portion. Infectivity was practically entirely lost, but not serological activity. This would indicate that the nucleic acid units are attached as side chains to the protein part of the virus molecule.

Comparison of some of the properties of normal tobacco mosaic virus with those of several variants produced by radiation was made by Kausche (*23*). Differences were found in turbidity in various solvents, viscosity, sedimentation constant, velocity of migration in an electric field, and phosphorus content. Knight and Stanley (*25*) found the phosphorus content of six strains of tobacco mosaic and two of cucumber virus remarkably uniform. Tyrosine, tryptophane, and phenylalanine in five of the strains of tobacco mosaic amounted, respectively, very closely to 3.8, 4.4, and 6.1 per cent. In Holmes' rib-grass strain these figures were 6.4, 3.5, and 4.3, and in the two cucumber strains very close to 3.9, 1.5, and 10.1. The authors concluded that the amino acid make-up of the protein of the virus has more to do with its specificity than its content of nucleic acid.

JOURNAL OF BIOLOGICAL CHEMISTRY, PHOTO BY J. A. CARLILE

Leaves of Turkish tobacco plant showing symptoms typical for each of six strains of tobacco mosaic virus. TMV = tobacco mosaic virus; YA = yellow aucuba; GA = green aucuba; M = Holmes' masked strain; J14D1 = a derivative, isolated by L. O. Kumkel, of J. H. Jensen's J14 virus; and HR = Holmes' rib-grass strain. The leaf showing the masked strain (M) is practically indistinguishable from the normal leaf, although it contains an appreciable amount of virus. The J14D1 and HR viruses differ from the other strains shown in giving distinct primary lesions on the inoculated leaves as well as typical secondary symptoms. In each of these cases, the first leaf shows characteristic primary lesions and the second leaf the secondary symptoms.

JOURNAL OF BIOLOGICAL CHEMISTRY

(1) Ultracentrifugally isolated tobacco mosaic virus applied to a collodion membrane at a concentration of 0.01 mg. per cc., showing particles having a width of about 15 millimicrons. X 13,700. (2) Mixture of same tobacco mosaic virus preparation used for (1) at a concentration of 1 mg. per cc. with an equal volume of normal rabbit serum and applied at a 1 to 100 dilution. The width of the virus particles is unchanged. X 13,800. (3) Mixture of same tobacco mosaic virus preparation used for (1) and (2) with an equal volume of an anti-tobacco mosaic virus rabbit serum and applied at a dilution of 1 to 100 to the collodion film 1 hour after mixing. Particles appear more dense, and are about 60 millimicrons wide. X 13,200. (4) Virus antiserum mixture of (3) applied at a dilution of 1 to 100 several hours after mixing. Note that thickened virus particles have fuzzy profiles and have formed an irregular framework. X 13,700.

According to Ross (*41*), glycine and histidine appear to be absent from the tobacco mosaic virus protein. No differences in analytical results were found between chemically and centrifugally separated samples.

A study of the behavior of a virus protein, with some of its chemically active groups masked by combination, should aid in determining what structures are essential to activity. At least two reports of such experiments have been made. Perhaps it is not surprising that they are not in perfect agreement.

Schramm and Müller (*49*) treated a preparation of tobacco mosaic virus with ketene until the free NH_2 groups were just acetylated. The electrophoretic charge was changed, but not the molecular weight or activity. Longer treatment with ketene inactivated the virus. Other samples were treated with phenyl isocyanate until all the free NH_2 groups were combined. This treatment did not change the sedimentation constant or the activity of the virus. Similar independent experiments by Miller and Stanley (*30*), of the Rockefeller Institute, resulted somewhat differently. Complete acetylation of the NH_2 groups by ketene required long treatment. Preparations in which about 70 per cent of these groups were covered, as indicated by the Van Slyke method, retained their infectivity. More complete acetylation decreased activity. It appeared that some of the tyrosine but none of the tryptophane had been acetylated.

The virus protein was still fully infective when up to 63 per cent of its NH_2 groups had been masked by treatment with phenyl isocyanate. In neither of these preparations did tests by the centrifuge or by electrophoresis give any evidence of the presence of virus molecules that had escaped the treatment. Oxidation of the sulfhydryl groups of virus protein did not change its specific activity. In all three of these cases the modified virus was infective but, as it multiplied in the host plant, normal virus was formed.

When Ross (*43*) inoculated tobacco plants with alfalfa mosaic virus there was an increase in the amount of virus from the 4th to the 12th day and then a rapid decrease. This is in contrast with the behavior of tobacco mosaic virus which, according to Spencer's studies cited above, continued to increase for a much longer time. Ross (*48*) also reported the particles of this alfalfa mosaic virus to be the smallest of any yet measured.

Crystals of a new tomato mosaic virus "Dahlem 1940" were prepared by Melchers *et al.* (*29*). This was very similar to tobacco mosaic virus, but different in some biological properties and in the average length of rods shown by the electron microscope.

Stanley and Anderson (*56*), of the Rockefeller Institute and the RCA Laboratories, have examined five viruses with the electron microscope. Particles of tobacco mosaic virus and of cucumber mosaic viruses 3 and 4 were rods of similar dimensions about 15 millimicrons by 280 to 300 millimicrons, although aggregation made the measurements of length somewhat uncertain. The particles of the viruses of tomato bushy stunt and of tobacco necrosis were spherical, with diameters of about 26 and 20 millimicrons, respectively. These dimensions agree well with those derived by proper interpretation of physical and chemical measurements.

Anderson and Stanley (*1*) also observed with the electron microscope the effect of mixing tobacco mosaic virus with its antiserum. Mounts made one hour after mixing showed a considerable increase in the diameter of the particles. The rather fuzzy outline of these new units led to the conclusion that the particles of the antibody arrange themselves radially around the virus rod. Some hours after mixing, an irregular framework of thickened virus particles was seen. This makes up the antigen-antiserum precipitate. Interpretations of the electron micrographs must be made with caution. The drying of the mount and its exposure in high vacuum may alter the form of the material appreciably.

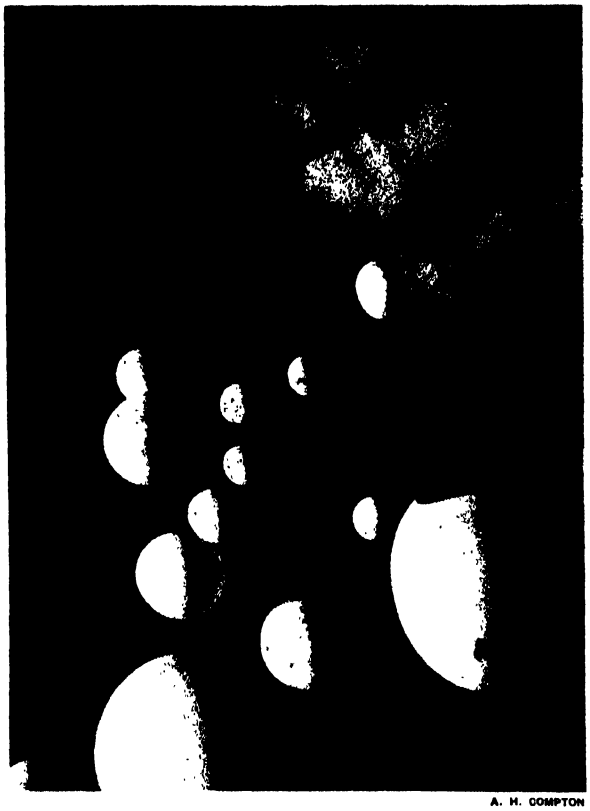
Recent Advances in Physics



THOMAS H. OSGOOD
Michigan State College, East Lansing, Mich.
and
RALPH B. BOWERSOX
University of Toledo, Toledo, Ohio

APPLICATION of nuclear physics to other fields of research has been one of the most important developments in modern physics. Historically the earliest applications were made in medical work over 40 years ago, shortly after the discovery of radium, while other applications have been increasing in variety and scope during the succeeding years. Robley D. Evans (*4*), at a meeting of the American Association for the Advancement of Science, outlined the progress made along these various lines. Prominent is the use of isotopes as tracers, both in the stable and radioactive form. In either case, Dr. Evans pointed out, the isotopes are really not tracers in the sense that a dye might be added to a stream to trace its subsequent course. The word "spy" might be more accurate since there is no difference chemically between the "spy" atom and the others. Ordinarily one such spy atom is used for each 10^{10} to 10^{15} normal atoms. Use of the stable isotopes as tracers was made possible by the development of the mass spectrograph, with which the relative abundance of the isotopes can be accurately determined. The normal ratio of the abundances of the isotopes is well known for nearly all of the elements, and the presence of the tracer is made known by an excess amount of this particular isotope. This method is particularly valuable in work involving organic materials, and has recently been applied to the problem of determining the earth's age by a study of the stable isotopes of lead resulting from radioactive decay of uranium and thorium.

The radioactive tracer isotopes disintegrate after a relatively short period with the emission of alpha or beta particles or gamma rays. These emitted particles or rays may be detected by Geiger-Müller counters or an ionization chamber and serve to indicate the presence of the tracer. Many of the radioactive isotopes can now be obtained in commercial quantities, and more than 350 such isotopes of the stable elements are known. This method is somewhat more sensitive than that using stable isotopes, but the decay periods of some of the radioactive ones are inconveniently short.

One application of the work on the abundance of the isotopes of the elements was made by Nier, Thompson, and Murphey (*8*), University of Minnesota, in calculating the geological age of some minerals containing uranium and thorium. These two elements are known to disintegrate ultimately into three of the isotopes of lead (206, 207, and 208). From a knowledge of the number of atoms of these istopes relative to the number of uranium, AcU, and thorium atoms present in a sample, the geological age of the mineral can be calculated, since the decay constants of uranium and thorium are well known. The intermediate members of the radioactive families have comparatively short half lives, so the following equations relating the numbers of atoms may be used:

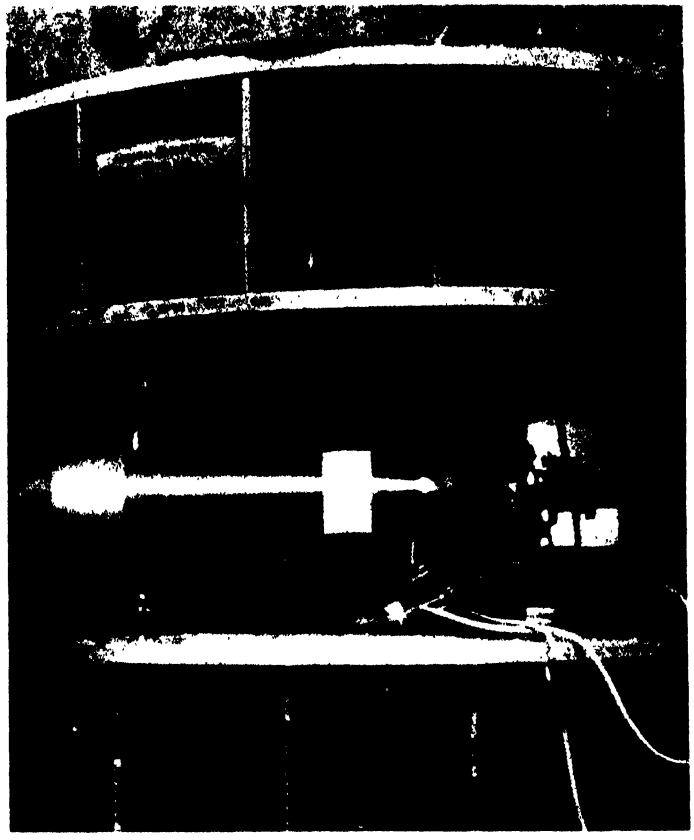
$$N(Pb^{206}) = N(UI)(\exp[\lambda(UI)\,t] - 1)$$
$$N(Pb^{207}) = N(AcU)(\exp[\lambda(AcU)\,t] - 1)$$
$$N(Pb^{208}) = N(Th)(\exp[\lambda(Th)\,t] - 1)$$

A. H. COMPTON

Balloons supporting the cosmic ray recording apparatus in flight at Bauru

λ is the radioactive decay constant, and t is the age of the mineral. The relative amounts of uranium, thorium, and lead were found by chemical analysis, and the mass spectrometer was used to find the relative abundance of the lead isotopes. A very small correction to the number of lead atoms was made for the amount of common lead impurity present, as indicated by the abundance of the Pb^{204} isotope. (Pb^{204} seems to occur in primal lead only and is not a radioactive product.) By applying the equations above, three different estimates of the geological age of the mineral may be given. Discrepancies among these estimates seem to indicate some alteration in the minerals. The ages of the eight samples studied ranged from about 60,000,000 to 2,000,000,000 years. The latter represents the oldest sample so far studied.

It is important to the physicist and the metallurgist to know the rate of diffusion of atoms of one material through another or of one material through itself, in the solid state. Carburization of steel, rates of hardening, and heat treatment of castings all depend on this diffusion process. Progress is being made toward measurement of these rates by means of radioactive tracer isotopes. Floyd R. Banks (*2*) has made use of radioactive zinc[65] as an indicator to measure the rate of self-diffusion in zinc. Zn^{65} was produced by proton bombardment of copper and was then electrolytically deposited on the polished, flat, etched surface of a single crystal of high-purity zinc. This crystal was held for a fixed time at an elevated temperature to allow diffusion to proceed, and then 10 thin sections 0.002 inch thick were cut from the surface by a lathe. The activity of each section, as measured with an electroscope or Geiger-Müller counter, was used as an indication of the penetration of the radioactive zinc atoms. The values of the diffusion coefficient calculated from the data varied from about 10^{-8} cm.^{2}/day at 685° K. to 2.5×10^{-6} cm.^{2}/day at 610° K.



By a similar technique using radioactive sodium, Joseph Steigman (*11*) has investigated the electrolysis of sodium through the glass wall of an electric light bulb and has found that the metal deposited on the inside actually comes from the sodium in the glass.

Over a year ago, it was discovered that thorium as well as uranium could be split into two fragments by a fission process. This year two new methods of splitting these heavy elements have been found—one the fission of thorium and uranium by protons and the other the fission of uranium by alpha particles. Dessauer and Hafner (*3*), at the University of Rochester, allowed a beam of 6.9 m. e. v. protons from the cyclotron to fall on a very thin sheet of thorium. Recoiling fission fragments were collected on a suitable aluminum foil a short distance away. The decay curve of the recoil fragments exhibited many different periods, indicating the presence of several different products. The threshold energy for thorium fission by protons was found to be 5.8 m. e. v. Uranium fission was produced in a similar way.

The potential barrier of a uranium atom for alpha particles is estimated to be 30 m. e. v., which lies within the energy range of the 60-inch cyclotron at Berkeley. Fermi and Segrè (*5*) used 32 m. e. v. alpha particles to bombard ammonium uranate and found isotopes of iodine and tellurium among the products, indicating the fission of uranium by this method. Thus gamma rays and all the simple massive particles, neutrons, protons, deuterons, and alpha particles are now known to be effective in splitting the heavy nuclei. The probabilities of occurrence of the various processes differ by factors of 10 to 1,000, some of them so small as to be at the lower limit of observation.

When slow neutrons are used to produce uranium fissions, the fragments all have atomic numbers between 35 and 57, except for 44 to 50, inclusive. With increasing neutron energy, some fragments are found in the 44 to 50 gap, and at present the only element not yet reported is tin (50).

Gillespie and Breck (*6*) at M. I. T. have performed an interesting and fundamental experiment with a thermal diffusion apparatus like that of Clusius and Dickel. Apparatus of this kind, frequently used in the separation of isotopes, consists of two long concentric vertical cylinders, with the inner one maintained at a high temperature with respect to the outer, and the fluid under investigation introduced between them. Convection currents are set up and in normal operation the heavier component or heavier isotope, which becomes relatively more concentrated on the colder wall, will be carried to the bottom of the apparatus. Gillespie and Breck used ternary liquid mixtures, particularly two solutes in water, to determine whether the behavior of each of the solutes is independent of the other.

G. DESSAUER

A 7 m. e. v. proton beam from the cyclotron such as was used to produce the fission of thorium and uranium

Acetic acid in water solution was enriched at the cold (lower) end of the apparatus even though sodium acetate was added. The acid and the salt in this case seemed to diffuse approximately independently. Enrichment of ferrous chloride in water at the cold end was considerable, but in the presence of 1 *M* hydrochloric acid, the enrichment occurred at the hot end! In the presence of sulfuric acid, there was no enrichment. Zinc chloride in hydrochloric acid and water reacted oppositely to the ferrous chloride. In some cases a heavy constituent of a ternary liquid solution apparently can migrate from the lower to the upper end, against the direction normally expected. The heavier component is defined to be the one which has the greater density when pure: it may have a smaller molecular weight.

The present concept of the nature of primary cosmic radiation, developed from many experiments during the past decade, has been made more exact by recent experiments. Swann (*12*) emphasized four points in a discussion of the problem.

(1) The primary rays coming in to the earth's atmosphere are of one type of massive charged particle, probably protons.

(2) The primary rays give birth to mesotrons in the upper atmosphere, probably indirectly.

(3) Those mesotrons born approximately at rest have such short lives that they disintegrate in the stratosphere and give rise to electrons emerging equally in all directions.

(4) Mesotrons formed with higher energy have longer lives and disintegrate at lower altitudes, giving rise to electrons possessing an average forward component.

In support of these statements, the following arguments are advanced. The primary rays are charged particles because they are affected by the earth's magnetic field, *i. e.*, they are most intense near the equator. Cloud expansion chamber photographs show tracks of electrons, mesotrons, and protons among the cosmic ray particles, and the mesotrons have such a short lifetime that they are probably not the primary rays. Finally, the electron has been eliminated from consideration by the experiments of Schein, Jesse, and Wollan (*10*), who sent recording apparatus to high altitudes in free balloons. The primaries are not electrons because they are non-"shower" producing, whereas electrons are. Primaries are much more penetrating than electrons and they come from all directions at high altitudes, while electrons can penetrate the earth's field only in a nearly vertical direction. Thus, the primaries must be protons. During the past summer, Professor Compton, together with Messrs. Jesse, Wollan, Hughes, and Hillberry from the University of Chicago, performed similar experiments in South America.

Somewhat of a controversy has arisen among ranks of the x-ray research workers over the interpretation of certain spots and streaks found on photographs taken by passing a narrow beam of x-rays through a crystal. These extraneous reflections generally occur very close to the spots reflected from the regular crystal planes, but they do not fit into the Laue pattern. Two theories have been put forth during the year to account for their presence.

Raman and Nilakantan (*9*) assume that the incoming x-ray beam sets up elastic vibrations in the crystal lattice by an inelastic impact and that in consequence the frequency of the primary x-ray photons is altered slightly. This

modified beam will then be reflected to a spot near the one to which the unmodified beam is reflected, since the angle of reflection depends on the wave length and thus on the frequency.

W. H. Zachariasen's (*13*) theory assumes that elastic vibrations are set up because of the thermal agitation of the atoms in the crystal and that the x-ray beam will be somewhat diffusely reflected as a streak from this oscillating lattice. Under appropriate conditions, sharp intensity maxima occur in these streaks so that they appear as spots. At present insufficient experimental evidence has been found definitely to favor either theory, although Zachariasen's seems to be somewhat the simpler of the two.

Several methods of attack are open to the research worker who wishes to examine a surface under the high magnification possible with the electron microscope. If the specimen is thick, the usual method of transmission of the electron beam through the material being investigated cannot be used. Recourse is had to the use of thermionic electrons from the surface itself or to electrons reflected from the surface. The second method is not very satisfactory, and the first method is limited to those metals which can be heated hot enough to emit electrons. Another indirect method involves scanning the surface with a very fine electron beam probe and reproducing an image of the surface on a cathode ray tube screen by a process similar to that used in television. This latter method at the present stage is not much better than the use of a microscope with visible light.

V. K. Zworykin and E. G. Ramberg (*15*) of the RCA Research Laboratories have reported a new method involving the preparation of a thin replica of the surface. This replica may then be investigated with the transmission-type electron microscope. A thick layer of metal (silver) is evaporated on the surface in question and then stripped off. Collodion is applied to this negative replica surface, and the metal is dissolved away from the collodion by means of acid. This leaves a thin positive collodion replica of the original surface whose ridges and hollows may be deduced from the density of the final photograph. The density at a point on the photograph is inversely proportional to the thickness of the collodion film at the correspondence point, so that a bright spot on the photograph would represent a high spot on the original surface.

Another development is the new 300,000-volt electron microscope reported by Zworykin, Hillier, and Vance (*14*). Preliminary tests indicate that it may be used on organic specimens 1 to 2 microns thick and that it shows a certain amount of the internal structure of the specimen.

It has heretofore been necessary to apply full voltage to an accelerating tube to produce a high-speed beam of electrons. The cyclotron will not work because its operation depends on the constancy of the mass of the particle being accelerated, whereas the relativistic change of mass of a 2 m. e. v. electron is about 500 per cent. This would mean a period of revolution five times as long for the paths of largest radius, thus throwing the beam out of phase with the accelerating voltage. D. W. Kerst (*7*) has recently constructed an electron accelerator, looking somewhat like a small cyclotron but embodying a radically different principle. The magnetic field is supplied by 600-cycle alternating current, thus producing an induced circular electromotive force within the evacuated glass accelerating chamber. Electrons liberated from a filament inside the chamber are accelerated in circular orbits nearly 8 cm. in radius. There is an electromotive force of about 15 volts for each revolution, and the acceleration is completed during the quarter of a cycle while the field is increasing. Perhaps 200,000 revolutions may be performed in this time, however, and the author estimates the total path length as about 60 miles. So far, 2 m. e. v. electrons have been produced, and there seems to be no reason why much higher energies may not be obtained[1]. The instrument shows great promise as a source of high-energy x-rays for medical and nuclear research. In addition it may be possible to bring the high-speed electrons themselves out of the apparatus after they strike the target.

An entirely different method of approach to the problem of the measurement of the velocity of light is represented by an experiment performed by Wilmer C. Anderson (*1*) at Harvard University. Instead of the usual method involving measurement of the time taken for a beam of light to traverse a measured path between mirrors, he has made use of the well-known law equating the velocity of propagation for a periodic disturbance to the product of the frequency and the wave length of that disturbance. The light wave itself was used as a "carrier wave" modulated in intensity with a Kerr cell at a measurable frequency of 19.2 megacycles. The "wave length" of this modulation, about 16 meters, was measured by an interference method similar in principle to the interferometer. An electron multiplier tube was used to detect the intensity minima. The velocity of light was found to be 299,776 ± 14 km./sec. and was constant within the accuracy of the experiment over a long period.

[1] With a later model built at the General Electric Laboratories Dr. Kerst has obtained 13 m. e. v. electrons.

WORLD-WIDE CHEMISTRY

The Inter-American Chemists Congress, scheduled at Santiago de Chile in January 1942, had to be postponed. Probably it will be held during the third week of September. Particulars can be obtained from the secretary of the organizing commission, Juan Hepp D., Casilla 3725, Santiago de Chile. The president of the committee, Eduardo Cruz Coke, is senator of Chile and candidate of the conservative party for the vacant presidency of the republic. The elections are in February and, if Dr. Cruz Coke is chosen, he will probably resign as head of the committee.

Mining and Geology Congress to Be Held

To the first Inter-American Congress of Mining and Geology, to be held in January at Santiago, will come delegations from the United States, Argentina, Brazil, Colombia, Peru, Bolivia, Mexico, Cuba, Nicaragua, and probably Canada and Honduras. The program includes excursions to mines, nitrate plants, and the steel works at Corral and Valdivia.

Aniline Dye Plant Being Constructed at La Catrina

The Sociedad Industrial de Colorantes S. A. is building a big aniline dye plant at La Catrina, near Santiago. Until now manufacturing was done in the building of the Inst. Médico Técnico Sanitas, but Colorantes will take over when the plant is ready. The Corporación de Fomento is participating in the company with 450,000 Chilean dollars.

Materials Chile Must Import from U. S. Listed

The Chilean Government has given its ambassador in Washington the following list of materials, which represent the minimum needs Chile can import only from the United States.

Material	Metric Tons
Zinc	1,300
Tin plate	13,000
Iron and steel	50,000
Iron wire	18,000
Copper wire	1,800
Paints	2,800
Paper pulp	15,000
Mineral oil	700,000
Diesel oil	60,000
Rayon yarns	1,200
Cotton yarns	35,000
Lubricating oil	14,000
Iron tubes	5,000
Tiles	5,000
Asphalt	2,000
Turpentine	1,100
Lubricating grease	5,000
Paper	10,000

Native Minerals to Be Exhibited at Samples Fair

In February an international samples fair will be held in Santiago. An exposition will be given by the Chilean nonmetallic mining industry, with 40,000 samples of different minerals including minerals of metallic ores.

Coal Deposits to Be Exploited for Synthetic Gasoline Manufacture

Preparations have started for exploitation of big bituminous coal deposits at Mahoma, district Los Lagos, province of Valdivia. The coal will probably be used for manufacture of synthetic gasoline.

Law Halts Development of Oil Deposits on Private Land

The government is absolutely determined to find oil in Magallanes or other parts of Chile. A United States prospector has been hired for about $6,000 a year, and $4,500,000 has been reserved for exploration during the next three years.

The oil situation in Chile is curious. Because of the various scandals in Mexico between foreign oil companies and owners of oil lands in that country, Chile has made a law that oil found on land in private hands passes at once to the government, which will pay the owners of the land a certain sum of money, to be fixed by government officials. This measure was directed against foreign oil companies, but the real result is that there seems to be no oil, because everybody hides it. During the big earthquake in the south of Chile in January 1939, there were not only eruptions of earth gas, but actually filterings of asphalt and naphtha in many places, especially in the department of Constitución, province of Maule. This is a public secret. But of course no landowner has ever seen anything like it, and the government cannot requisition the land on suspicions. Public opinion is that, until this law is abolished, not very much oil will be found. This holds true in Magallanes, too, because even the United States prospector cannot prospect on private lands.

Sodium Sulfide Declared in Overproduction in Chile

Sodium sulfide has been declared in overproduction. This means the two existing plants may not increase output, and no other factory may produce it without special permission from the government. Sodium sulfide is exported regularly, mostly to Brazil, Argentina, and Peru. The average export price is about 5 Chilean dollars per kilogram, f. o. b.

New Export and Import Regulations Announced

The government is introducing a new surtax on imported goods, which are regarded as luxuries. The surtax is 10 per cent over the value c. i. f. plus duties, and includes passenger cars above $1,000, radios and musical instruments, phonograph records, firearms, glassware, perfumes and cosmetics, and liquors.

Export has been forbidden in 1942 for so-called cod liver oil, which is actually liver oil of the *Congrio*.

Because of the high price of shoes, export of leather has been prohibited for 1942. Previously the Chilean leather industry exported about 30 per cent.

Editor's Note. Those interested in further details should address the correspondent whose name and address appear for each country, and enclose sufficient international coupons to prepay the reply. United States stamps should not be sent.

The government of Brazil has bought 10,000 tons of nitrates in Chile in exchange for the equivalent in sugar, which Brazil will export to Chile.

Insecticide Company Bought by Imperial Chemical Industries

Mussla Ltda., which manufactures insecticides for agriculture, has been bought and taken over by the Chilean branch of Imperial Chemical Industries, Ltd.

Miners and Smelters Contract with Metal Reserve Company

The Metal Reserve Co. has made a contract with the Sociedad Nacional de Minería, which represents the independent miners and smelters. The contract is for 18 months but can be terminated within six months. The Metal Reserve Company pays in U. S. money, f. a. s. Chilean port, standard copper 11.75 cents per pound, mercury $190 per flask, and manganese ore, 44 per cent, 42 cents per unit.

RUDOLFO ZOELLNER J.

CLASIFICADOR 208
SANTIAGO
December 21, 1941

Government control over British chemical markets continues to expand. During the last month tin, the only important commodity left with a free market, was brought under supervision of a Ministry of Supply Controller who has requisitioned all stocks in the country, fixed maximum prices, and reserved the right to allocate supplies. Rubber, under a controller of its own since April last, is now under the charge of a Rubber Control Board. Exports of all rubber manufactures have been subjected to the usual license system, and manufacture of nonessential rubber goods has been prohibited. To help the Ministry of Supply in distribution, the Wood Tar and Pitch Importers' Association has been formed along the line of other recent organizations for resins, starch, and other import commodities. Starch and dextrin control has been tightened by prohibition of the use of starch, flour, and dextrin made from sago or tapioca for any purpose whatsoever.

Far Eastern War Causes New Controls in Chemical Industry

The more important of recent controls have been caused by extension of war to the Far East, but they must not be regarded as indicating an actual shortage of tin, rubber, and similar commodities in the British Isles. The measures are precautionary, taken despite well-known existence of large stocks in consuming countries including Great Britain. Prices have increased substantially, however, in some markets of other Eastern commodities such as menthol, benzoin, dragon's blood, peppermint oil, agar-agar, and camphor, and extension of control to certain of these products would not cause surprise. The quantities of these and similar articles on the British market have been very small for some time and some products are purely nominal at present.

Demand for Industrial Chemicals Continues High

Demand for industrial chemicals is heavy. There is a large call for sodium hydroxide, a steady demand for refined sodium nitrate, a moderate business in sodium percarbonate, while dichromates are rationed, chlorates are in short supply, and yellow sodium cyanide can be obtained on the open market in restricted quantities only. Steady deliveries of sodium ash and sodium bicarbonate do not preclude a fair amount of new inquiry, and the market is steady for all available quantities of such products as potassium permanganate, liquid chlorine, bleaching powder, and borax. No relaxation of pressure is reported for formaldehyde, as well as barium chloride and carbonate. Demand for calcium carbide is strong, for hydrogen peroxide fair, and for gray calcium acetate firm.

New Outlets Sought for Coal-Tar Pitch

Heavy accumulations of coal-tar pitch caused by the big call for other coal-tar products have stimulated research into new outlets for the product. The Coal-Tar Controller recently expressed himself strongly in favor of increased use of creosote-pitch mixtures and pitch for heating. Development of new outlets for pitch helps maintain production of naphthalene, anthracene, tar acid, carbolic acid, and other vital products at the present time. It is hoped to stimulate use of tar products as fuel after the war, although this is largely an economic problem dependent upon the competitive power of pitch in normal market conditions. Several types of creosote-pitch boilers have been used for years, and experience generally has been satisfactory.

Desulfurization of Coal Being Studied in Midlands

Desulfurization of coal by crushing and washing has been studied by the Midland Coke Research Committee. Experiments have been conducted on Ganister coal from South and West Yorkshire, a good coking coal which heretofore could not be used for coke because of its high sulfur content of 4 per cent. Float-and-sink tests on coal crushed to different maximum sizes showed that crushing as fine as 200 mesh (the Institute of Mining and Metallurgy Series) fails to release all the pyrites which are the chief cause of the high sulfur, but crushing to 0.1 inch frees 50 per cent of the pyritic sulfur. To avoid difficulties of handling very fine coal, it was concluded that crushing the coal to 0.1 inch, dedusting at 60 mesh, and washing the oversize in a trough washer would reduce the sulfur content to 3 per cent. The high physical quality of the coke would in many circumstances with lean ores compensate for its high sulfur content.

Colonial Oil Plants Studied as Motor Fuel Possibilities

The Colonial Office reports that preliminary work is in progress at the East African Agricultural Research Station on the possibility of preparing petrol from vegetable oils or fatty acids obtained from them. Distinctly hopeful results have been obtained. Large stocks of these products are now in East Africa.

Alternating Double Filtration Urged for Sewage Purification

Alternating double filtration is a new process for biological purification of sewage and trade effluents developed by the Water Pollution Research Board over a number of years. It is based on the discovery made in the laboratories of the Birmingham Drainage Board that excessive accumulations of solid matter in the top layer of single filters can be removed and the filter again brought into a satisfactory condition if the filter is treated for a week or two with purified effluent from another filter. Two experimental filters are now treating about three times as much sewage as can be treated by single filtration. The change-over from single to alternating double filtration requires installation of more tanks and pumps, but the saving in capital and construction materials is considerable.

Natural, Synthetic Vitamins Emphasized in Wartime Diet

In view of the unavoidable limitations of wartime diet, a good deal of attention has been given by nutrition experts and food chemists to the manufacture and supply of vitamin-containing food. Sirups and other materials rich in natural vitamins have been prepared for children in schools and nurseries, and vitamin-rich

foods have also been given as extras to civil defense and war workers engaged on night work or otherwise deprived of a normal amount of sunlight. These additions have in part been given in the form of synthetic preparations. As far as the general public is concerned, vitamins have been added to some such foodstuffs as margarine and cocoa, sometimes in accordance with government instructions and sometimes by the manufacturer himself without such encouragement. Approximately 25 per cent of the white bread and flour consumed in the United Kingdom is being fortified with vitamin B_1; there is only one producer of synthetic vitamin B_1 in the country. A jelly containing vitamin C extracted from the hips of wild roses is also being made by a firm of chemical manufacturers in Eire.

Tinning Oils from Petroleum Developed

Experiments at the Tin Research Institute have resulted in the development of tinning oils, customarily used in a floating layer on top of the molten tin bath in the manufacture of tin plate, which are derived from petroleum. Several suitable mineral oils have been selected which can be used throughout a comparatively wide range of temperatures and show excellent stability and considerable freedom from fuming and fire hazard. Each carrier may be used combined with a choice of active agents. Some of the oils that were tested compare favorably with palm oil and tallow, now in most common use, especially at high temperatures such as are met in hot tinning. Others are useful for covers of lead-tin baths.

Rhodesian Copper Producers Establish Research Laboratory

A joint laboratory for metallurgical and chemical research has been established for the Rhodesian copper industry at Nkana. There is a fully equipped section for flotation research, pyrometallurgy, and smelting reduction processes.

Nonfelting Wool Demands Special Dyestuffs Treatment

Application of nonshrinking and nonfelting wool processes has made great progress in the British textile industry since all materials for the armed forces must be unshrinkable and there is a tendency to extend the process to utility cloths offered to the public at large for wartime wear. Nonshrinking wool materials last about twice as long as untreated fabrics, while the cost is generally very small. The processes in general use employ chlorine, hypochlorites, sulfuryl chloride, nitrosyl chloride, sodium bisulfite, potassium hydroxide, sodium hydroxide, formic acid, and other chemicals. Although the total demand for nonshrinking wool is of little weight in chemical markets as a whole, it is felt distinctly in some smaller markets.

Nonfelting wool, as established by the Wool Industries Research Association, demands special treatment in dyeing, since it takes up dyestuffs at a greater rate than does the untreated material. With prolonged boiling, however, colors of the level-dyeing or crystalloidal type assume an equal shade on ordinary and nonfelting wool, whereas colors of colloidal type maintain a substantial difference in shade after dyeing for the normal time.

Steps Taken for Output of Rubber Substitutes Questioned

In reply to a Parliamentary question whether any steps were being taken to establish factories for the manufacture of synthetic rubber in Great Britain, it was said that the Minister of Supply has fully in mind the necessity of adjusting rubber supplies by the extended use of substitutes.

Fertilizer Obtained from Water-Softening Plant

Waste sludge from locomotive water-softening plants is being sold by the London and North Eastern Railway Co. to market gardeners.

Sulfur Dyestuffs Used for Army Equipment

Sulfur dyestuffs have played an important part in the dyeing of equipment for the armed forces, both for cotton yarn and pieces and for wool and cotton cloth, it was reported by H. Boothroyd to the Scottish Section of the Society of Dyers and Colourists. Special service requirements include a high degree of water resistance and for certain equipment resistance to treatment with hydrogen peroxide and citric acid. Fastness to light and washing is improved by aftertreatment of fibers dyed with sulfur colors by the copper dichromate process. Raw stock dyeing is useful in production of cotton yarns and webbing for purposes where a great deal of abrasion will be experienced.

G. Abrahamson

150 Halfway St.
Sidcup, Kent
December 29, 1941

Inability to obtain phenol, formaldehyde, polyesters, and other chemicals has resulted in the closing of the Colombian concern, Industria Plástico Quifmica, Ltda., American consular officials have been advised.

Chemical Exports and Imports of Iraq Decline

Demand for chemicals and allied products from Iraq has been fairly active during the past two years, but the country is reported to be experiencing difficulty in fully meeting its requirements because of withdrawal of such European sources of supply as Germany and restriction on shipping from other sources, as the United States and Great Britain.

Domestic production is said to be limited to only a few items. Domestic output, which includes oxygen, carbon dioxide, alcohol, some vaccines and serums, perfumery, and laundry soap, continued up to the first half of 1941. In addition a number of dye factories were operating at the time.

Quantities imported in 1940 decreased decidedly compared with 1939, although the values were reversed because import prices rose sharply. Declines in fertilizers, dyes, paints and varnishes, sulfuric acid, tartaric acid, glycerol, and medicinals were reported. Iraq furnishes gum tragacanth, gum arabic, and other gums, henna, and licorice. Except for licorice and gum tragacanth, exports of these commodities declined in 1940.

War Gives Britain Clear Field in Egyptian Market

Elimination of German and interruption of French supplies of chemical products gave British chemical exporters a clear field and undisputed lead in the Egyptian market during 1940, figures for the year indicate. Formerly France was second only to Great Britain in the Egyptian medicinal and pharmaceutical trade.

The Egyptian Government is the most important single purchaser of chemicals and allied products. General sales of chemicals in that country during 1940 were about level with 1939, but imports showed a 10 per cent gain, attributed mainly to a sharp increase of purchases of sodium nitrate from Chile. This in turn is said to reflect the improved position of Egyptian cotton growers, incident to the cotton purchase program of the British and Egyptian Governments. Other chemical and pharmaceutical products showed between 10 and 15 per cent increase.

Guatemalan Broomroot Exported to United States

Small shipments of broomroot, grown near Quetzaltenango, Guatemala, have been made periodically to the United States by one of two firms engaged in production, harvesting, sorting, and preparing it for export. Several Guatemalan firms are also engaged in buying for export, principally to South American countries.

Expansion of Copper Sulfate Production in Italy Planned

COPPER sulfate is a critical material to Italian economy, a recent survey by the Department of Commerce indicates, with word of projected expansion of the chemical industry in that country to provide for greater self-sufficiency in major items.

At the outbreak of war the industry consisted of approximately 4,500 firms employing 150,000 workers. Local plants supplied the nation's agricultural requirements for insecticides, fungicides, herbicides, and similar products.

An annual quantity of 25,000 to 30,000 tons of copper is required to meet the need for copper sulfate, indispensable to the native wine industry. The coming agricultural year finds a supply of 9,000 tons of copper available to the chemical industry. Sales of copper sulfate are under strict governmental control.

Chemical Fertilizer Industry in New Zealand Sets Record

RECORD highs in physical volume and production value are reported for the New Zealand chemical fertilizer industry in the period 1940–41.

Nine factories engaged in the industry during the year produced 501,409 long tons of superphosphates, compared with 417,160 in the preceding year, a gain of 20.2 per cent. Output of other chemical fertilizers declined from 140,723 long tons in 1939–40 to 133,313 the past year.

During 1940–41 1,171 persons were engaged in the industry in that country, compared with the previous year's total of 1,084, with a 10.5 per cent increase in salaries and wages. Materials used increased 17.5 per cent in cost, and value of products 13.1 per cent.

Uses of Netherlands Indies Tingi Bark May Be Expanded

WAR-RIDDEN areas of the Netherlands Indies are sources for various barks and other wood substances used industrially. Among them is tingi bark, used partly as a dyestuff to develop color of other dyes, and in the Far East in particular, as a dye and preservative of fish nets. It is also hoped to develop this bark for use in batik production.

Total exports were 3,176 metric tons in 1938, dropping to 1,811 in 1940, with large quantities normally exported to Hong Kong and China for use by the fishing industry.

ARGENTINE imports of iodine in 1940 came to 56,890 pounds, compared to the average annual imports of 39,958 pounds recorded for 1937–39. During this three-year period United States sources furnished an average of only 249 pounds.

Mexico Replaces Sweden as Argentine Source of Arsenic

MEXICO appears to be supplanting Sweden as a source of Argentine imports of arsenic. It is brought into that country as "arsenic anhydride" white, and used mainly in the manufacture of sheep dip and in smaller quantities for preserving hides and skins.

Imports totaled 1,009 metric tons in 1938, 1,094 in 1939, and 1,195 in 1940. Imports of dry sodium arsenite are relatively small, and not reported separately. Annual imports of sheep dip run to 9,000 metric tons, but a considerable amount is manufactured domestically.

Lack of Raw Materials Hinders Argentine Development of Plastics

DIFFICULTY in obtaining essential raw materials, especially formaldehyde, apparently precludes any extensive development of plastic molding products at this time in Argentina. No Argentine firm now manufactures plastic molding materials on a commercial scale, although several attempts were made in the past. Only a negligible output resulted in each instance, it was said.

Britain to Buy Entire Egyptian Flax Crop

BRITAIN expects to buy the entire Egyptian flax crop of 1941, according to the U. S. Department of Commerce. The closing of certain European sources has been beneficial to the Egyptian industry, it is indicated, and hope was expressed by the country's Ministry of Agriculture that the output could be increased to at least 50,000 acres in the coming season. In 1939 3,900 acres were planted in flax. The fiber is reported to be first-grade, comparable to the product in northern European countries. Increased flax production is linked with plans to supplement Egyptian cotton with new crops.

Pharmaceutical Sales in Egyptian Market Boom

A BOOM in sales of drugs and pharmaceuticals generally is reported in Egyptian markets, where imports of such items are estimated to have gained between 10 and 15 per cent in 1940 over the previous year. Virtually every pharmacy and drugstore in the principal Egyptian cities is doing a larger turnover than in prewar years, owing to increased purchasing power in the country, it is said. Prices have increased to 20 to 25 per cent over those of 1939.

A CHILEAN organization, the Sociedad Chilena Explotadora de Potasa, has projected an output of 30,000 tons annually of potassium salts at its new plant. A new plant for manufacturing ammonium nitrate also is being considered.

India's Organic Acid Production Increases

INCREASED production of some organic acids is reported from India, where a small plant located near Abmedabad is said to be turning out 300 tons of acetic acid per year from calcium acetate. However, the current supply of this substance is said to come largely from Canada.

Similarly the bulk of India's consumption of organic acids such as tartaric, citric, and oxalic still is imported, although a plant in the Punjab has just started production of oxalic acid, and raw materials for tartaric and citric acids are available.

Chilean Nitrate Industry Reports Satisfactory Year

THE Chilean nitrate industry is believed to have had satisfactory production and shipments as of August 1941, the latest date for which any information has been available in the United States from official sources. No statistics were reported, but activity has been maintained, it was said. Any material change in the nitrate situation is not anticipated for some time to come.

Java Lowers Export Taxes on Cananga Oil

APPLICATION of local regulations lowering export taxes on Javanese cananga oil is reported from Java. Owing to small offerings, citronella prices are said to have recovered somewhat from a decline in September, but as a result, production the following month was 50 per cent below normal. The lowering of export rates is an attempt to improve production and trade in cananga oil.

China Increases Alcohol Production

SPURRED by war needs, China has greatly augmented its alcohol-producing facilities, it is reported from Chihol, in that country. Some 36 plants have been added in the past four years with private capital. Total capacity of these plants is estimated at about 4,500,000 gallons annually. Raw material used is molasses from the large sugar-cane production in Szechuan province.

Before hostilities, annual production of alcohol from private plants in China was 2,388,000 gallons. In 1940 Chinese production in the unoccupied portions of the country was 6,050,000 gallons. In addition to private plants, the National Resources Commission operates seven plants producing alcohol from molasses and potatoes.

POTOMAC POSTSCRIPTS

Priorities and Allocations

Aluminum. The Nation's entire supply of aluminum was marshalled for war January 27 by Production Chief Donald M. Nelson with the issuance of Conservation Order M-1-e. The use of aluminum is prohibited in any manufacture except on war contracts and items specifically set out in the order. The only exception is that aluminum authorized by the Director of Priorities after October 31, 1941, and prior to the effective date of this order may be used for the specific purpose set forth. Only 15 uses of aluminum are permitted, most of them restricted to low-grade aluminum which has not been debased. Anhydrous aluminum chloride may be produced only for the manufacture of dyes for war textiles, high-octane gasoline, tear gas, nylon, or pharmaceuticals. The steel industry may use aluminum as a deoxidizer or alloying agent under specific restrictions. Its use in all other alloy operations is also restricted. Commercial aircraft makers cannot use aluminum except on ratings of A-10 or higher. Containers for intravenous solutions and blood, welding rods, and x-ray tube housings may be produced.

Other permitted uses are condensers to replace defective ones in existing radio sets; match plates, patterns, and snap flasks for use on orders with ratings of A-1 or higher; orthopedic equipment, where light weight is vital; pistons for engines of trucks 1.5 tons or over, heavy-duty tractors, Diesel engines, and engines for portable fire-fighting equipment; and replacement of worn-out or defective aluminum parts, provided that the old parts are returned by the consumer.

Chromium. Control over chromium, vital alloy for corrosive and heat-resistant steel, has been tightened by an amendment to Order M-18-a. The amendment prohibits any person from melting more than 2 tons of ferrochrome in any one month without specific authorization. The purpose is to prevent using up inventories of ferrochrome to fill less essential rated orders for chrome steel.

Ethyl Alcohol. Regulations governing receipts and shipments of ethyl alcohol and related compounds, brought under control by General Preference Order M-30 last August, are revised under terms of Amendment No. 3 to the original order, now in effect.

Definition of ethyl alcohol is changed to indicate that alcohol for industrial purposes only is comprehended. Proprietary solvent is included in the definition of this term.

Restrictions on receipts will be by calendar quarterly periods, rather than monthly. Restrictions on producer's deliveries, previously contained in the order, are rescinded.

Certain orders, including those with an A-1-j or higher rating, may be filled without reference to quantity limitations. Quantities delivered under these orders shall be in addition to the restricted quantities permissible.

Deliveries to the Army and Navy, Lend-Lease countries, and persons holding Internal Revenue permits for the acquisition of tax-free alcohol are exempted from quantity and certificate requirements. Also exempted from provisions of the order are monthly deliveries of 54 gallons or less of ethyl or isopropyl alcohol to any one person during one month.

Fats and Oils. The War Production Board has relaxed General Preference Order M-71 on fats and oils by eliminating the three months' inventory restriction and substituting a restriction on processing.

The control powers already possessed by the board over distribution and use of fats and oils will be exercised if and when any shortage should occur. The amendment leaves the processor free to use his fats and oils to fill contracts for finished products unless and until the Chairman of the War Production Board or the Director of Priorities directs otherwise. No processor of fats and oils may produce more of his product than is required to fill his orders and to give him a practicable minimum working inventory.

Latin American Materials. Allocations of materials for Latin American requirements have been announced for the first quarter of 1942:

Acetone, 100,000 pounds; ammonia, anhydrous, 795,000; ammonium sulfate, 10,100,000; aniline, 95,000; carbon tetrachloride, 140,000; caustic soda, 35,000,000; chlorine, 500,000; chromium tanning chemicals, 565,000; citric acid, 620,000; copper sulfate, 17,500,000; formaldehyde, 175,000; glycerol, 350,000; plastics, 150,000; potash salts, 3,500,000; potassium permanganate, 50,000; soda ash, 47,500,000; sulfuric acid, 2,000,000; superphosphate, 17,500,000; tungsten, 2,500; rayon, 3,300,000; nickel, 15,000 pounds; miscellaneous farm equipment, $13,000,000; platinum, 4,500 ounces; methyl alcohol, 55,000 gallons; and phosphorus, 69,000 gallons.

Mercury. The Nation's mercury usage has been curtailed by Conservation Order M-78, which provides that after January 15 no person shall use mercury in the manufacture of any item or process on List A of the order in excess of 50 per cent of his requirements during a given base period and that after March 31 he will stop using mercury for such purposes.

List B contains articles whose manufacture may be continued at 100 per cent, and in one case at 125 per cent, of the rate during the first quarters of 1940 or 1941, at the option of the manufacturer. These items include fluorescent lamps, health supplies, industrial and scientific thermometers, and mercuric fulminate for ammunition and blasting caps.

Persons working on priority ratings lower than A-1-j will be limited to 80 per cent of their consumption during the first quarter of either 1940 or 1941, provided they are not working on government contracts or articles required to comply with Underwriters' or safety regulations.

Repair, Maintenance, and Operating Supplies. Running at full capacity, the war chemical industry is to receive the assistance of high priority ratings in securing necessary repair, maintenance, and operating supplies. Preference rating order P-89, issued January 26, assigns an A-1-a rating to deliveries of materials to repair actual breakdowns, A-1-c to avert immediately threatened stoppages, and A-3 for other repairs, maintenance, and operation. Before applying any of the ratings, a manufacturer must file with the Chemicals Branch, War Production Board, a statement setting forth certain required information, including amounts of material used for repair, maintenance, and operation during the first six months of 1941, inventories of such material on hand on December 31, 1940, and on June 30, 1941, and must be assigned a serial number under the order. Serial numbers will be assigned only to companies whose products are being used for war or essential civilian purposes.

Neither the A-1-a nor the A-1-c rating may be used to replace material withdrawn from inventories, and the A-3 rating cannot be used for that purpose if, at current rates of consumption, further deliveries would increase inventories above the stipulated minimum. Prior authority, which may be obtained telegraphically, is required before application of the breakdown ratings.

A supplier may not use the two high ratings. He may make use of the A-3 to expedite acquisition of materials which will be delivered by him or another supplier to a producer whose purchase order carries one of the authorized ratings; or to restore his inventory to a practicable working minimum only if, after filling a rated order, his inventory is reduced below such a minimum; if he supplies material which he has in whole or in part

manufactured, he may not apply the rating to restore his inventory to the permitted minimum unless he does so before completing the rated delivery which depletes it. A supplier who provides material to fill rated orders, which he has not in whole or in part manufactured, may defer use of the rating to restore his inventory until he can place a purchase for the minimum quantity procurable on his customary terms, provided he does not defer application more than three months after he first became eligible to apply it.

Research Laboratories. An interpretation of Preference Rating Order P-43 granting priority assistance to research laboratories has been issued to emphasize that the preference rating assigned cannot be used for construction or expansion of laboratory buildings. The only material obtainable under the order by a laboratory is that which will itself be used in the conduct of scientific research or which will enter into the production of material to be so used.

Sodium Nitrate. A complete allocations system for sodium nitrate, effective February 1, has been announced under General Preference Order M-62.

Sodium nitrate is used as a fertilizer, for the manufacture of industrial explosives, nitric acid, potassium nitrate, and glass, and in meat curing and preserving. Demand, particularly for agriculture, is expected to exceed for the spring months supplies on hand and in sight, and strict rationing of supply will be necessary.

Approximately 70 per cent of United States sodium nitrate requirements are imported from South America. Lack of shipping space may interfere with imports, thus making allocations necessary.

Sulfite Pulp. All sulfite pulp allocated for special purposes in January under General Preference Order M-52 has been assigned to Rayonier, Inc. Under the original order, issued January 9 and announced in the January 25 issue of CHEMICAL AND ENGINEERING NEWS, page 123, 4,200 tons of sulfite pulp were to have been set aside for the relief of regular customers of three producers whose plants are widely engaged in war work—Rayonier, Eastern Corp., and Brown Co. Eastern Corp. and Brown Co., according to information received by the War Production Board, can take care of their customers at this time without drawing upon other producers for relief tonnage under the allocation plan.

Tin and Lead Foil. The tin and lead foil order, L-25, has been revoked. Limitations on the use of tin and lead foil are contained in Orders M-43-a and M-38-c, making L-25 unnecessary. The order first was issued November 24, 1941, and its effective date later was postponed for 30 days. A subsequent postponement was made pending issuance of the other orders.

Titanium Dioxide. The percentage of titanium dioxide which must be set aside by producers for direct allocation by the Division of Industry Operations, WPB, has been increased from 20 to 25 per cent by Amendment No. 3 to General Preference Order M-44.

Price Regulations

Borax and Boric Acid. Advances in price of $1.00 a ton on borax and $2.00 a ton on boric acid, justified by increased production costs, were permitted in telegrams sent to members of the industry January 28 by Leon Henderson, OPA Administrator. Until March 24 borax and boric acid are not to be sold at prices in excess of the following per ton f. o. b. plant, freight allowed to destination: borax, granular technical in bulk, $41.50; boric acid, granular technical in bulk, $95.50; regular differentials to apply to shipments in containers and to borax and boric acid sold in commercial forms.

Fluorspar. Fluorspar producers are asked by OPA not to publish, quote prices on, or sell this nonmetallic mineral at above their prices in effect January 2. If any producer considers it necessary to increase prices above the January 2 level, he is requested to notify OPA one month in advance of the date on which the intended increase would take effect. Leon Henderson, OPA Administrator, asked that a detailed factual statement of reasons believed by the producer to justify the proposed increase, including financial data, be submitted. Prices as of January 2 are believed adequate to ensure a supply from existing sources sufficient to meet the increased demand. Fluorspar prices have advanced substantially in the past six months.

Formaldehyde. Price Schedule No. 21 for formaldehyde has been amended to avert hardships to certain users. The amendment withdraws exemptions for formaldehyde to be used in embalming fluids from the maximum prices provided in the schedule, and puts all users on the same basis, regardless of the purpose for which it is intended.

Under the amendment, a reasonable charge for containers is allowable when formaldehyde is shipped in carboys or drums. Prices for shipments in barrels and kegs include the cost of containers. This conforms with trade practices.

Maximum prices for solutions of content other than 37 per cent by weight (U. S. P. formula) are calculated on prices set forth in the original price schedule, multiplied by the number of pounds of formaldehyde by weight contained in 100 pounds of the solution for which the price is to be determined and divided by 37. This assures prices accurately computed upon formaldehyde content.

Sulfur. The Freeport Sulfur Co. has voluntarily offered to continue to sell sulfur throughout the current year at the 1941 base price of $16 a ton, f. o. b. mines, Price Administrator Leon Henderson has announced. At the beginning of 1941 the company, which operates mines in Texas and Louisiana, gave Mr. Henderson an unsolicited pledge that it would not increase the $16 base price of an amount of sulfur sufficient to last its customers for one year at the then current rate of sales.

Although, according to Langbourne M. Williams, Jr., Freeport Sulphur president, sales in 1941 considerably exceeded the amount indicated by the rate prevailing at the time the company made this commitment, all demands for sulfur were filled during the full year at no increase above the base price. Mr. Williams said the company is glad to renew this offer for 1942.

Mr. Henderson expressed his sincere appreciation of the attitude displayed by the company and said, "The efforts of my office to hold prices stable in the face of tremendous inflationary pressures have been assisted importantly by the splendid cooperation given by this major producer. Indeed, the example set by Freeport Sulphur is one that many other industries might well use as a pattern in this war emergency."

Regulation for Control of Explosives

REGULATIONS for the control of explosives and their ingredients in time of war or national emergency have been issued by the U. S. Bureau of Mines under authority of Section 18 of the Federal Explosives Act of October 6, 1917, as amended by the act of December 26, 1941. Violations are punishable by a fine of not more than $5,000 or by imprisonment for not more than one year, or both.

The licensing is required of all persons and establishments for operations relating to explosives or ingredients, with certain exceptions. Arsenals, navy yards, depots, or other establishments owned or operated wholly by or on behalf of the United States need not be licensed. Explosives and ingredients in quantities of 1 ounce or less are also exempted.

Five kinds of licenses are issued—manufacturer's, vendor's, purchaser's, foreman's, and analysts-educators-inventors-investigators. Generally one license will fit all needs of any particular applicant. The last-mentioned license authorizes purchase, manufacture, possession, testing, and disposal of explosives and ingredients for scientific, education, and testing purposes only, and is required of schools, laboratories, and other institutions and persons. It is not required of a manufacturer who customarily conducts such operations.

Wheat to Be Sold for Ethyl Alcohol Production

THE Commodity Credit Corporation is prepared to sell wheat, in place of corn, for production of ethyl alcohol, acetone, and butyl alcohol, according to the U. S. Department of Agriculture.

Under this plan CCC will sell wheat at 91 cents a bushel delivered to processors of the above products. A lower sales price will be made to processors with unusually high conversion costs, but no sales of wheat will be made at less than 80 cents per bushel. These prices are comparable, on a pound basis, to the prices previously quoted for corn. A slightly higher yield of alcohol may be obtained from wheat than from corn. Wheat can be substituted for corn with only minor adjustments in the processes for making alcohol from corn. The wheat price is based on the present price for ethyl alcohol of 50 cents per gallon established by OPA. It will be adjusted for any change in the established ethyl alcohol price.

On January 15 the Department of Agriculture announced the plan of selling corn for ethyl alcohol production. Contracts are being executed under the plan for the period ending March 31. At that time it may be necessary to limit sales solely to wheat for ethyl alcohol production.

Bottling Plants Offer Emergency Drinking Water Source

AS EMERGENCY sources of drinking water if local water supplies are damaged by enemy action, use of facilities of more than 6,000 beverage plants in 2,900 cities and towns have been offered to the Nation by the American Bottlers of Carbonated Beverages, national trade association of the bottled soft drink industry.

Use of such facilities was suggested in a statement filed by the organization with the Office of Civilian Defense, stating: "In the event of impairment of the normal water supply through enemy action, such as by breakage of mains and admission of foreign material, beverage plants using such sources and having specialized water-treating equipment may be in a position to produce a potable water supply through chlorination for the population in their locality". Bottle-washing and sterilizing equipment of the plants, it was said, would provide safe containers for the water and for its distribution in larga areas.

OCD has suggested that, as a preliminary step, each proprietor of a bottling plant contact the defense director or coordinator for his community, giving written information concerning availability of the special water-treatment equipment in the plant and independent sources of water which might be used in an emergency.

Nation Moves to Attain 400,000-Ton Synthetic Rubber Output

POOLING patents, resources, experience, and technical skills by the rubber, chemical, and petroleum industries should make possible attainment of the Nation's 400,000-ton synthetic rubber program, according to E. R. Weidlein, chief of the Chemicals Branch. Many technical difficulties have been avoided by the pooling of patents and technical information, Dr. Weidlein said. The best example of this is that the production program now underway will avoid the use of chlorine. Chlorine is widely used in war production, and present demands exceed supply.

Enough raw materials, provided largely by the chemical industry, are in sight for half the proposed program. Basic ingredients for the Buna S type synthetic rubber, adopted as a standard, are butadiene and styrene. Butadiene is produced from petroleum, natural gas, alcohol, or acetylene. Styrene is a by-product of the coke industry, coming from benzene. Some 20 other chemicals are needed for synthetic rubber production, but the quantities used are small and present no large production problems.

If high priority ratings are assigned for the necessary quantities of noncorrosive steel for equipment, the first 200,000 tons of synthetic rubber will be in production by January 1, 1943, Dr. Weidlein asserted. The problem of raw materials for the next 200,000 tons has been discussed with the petroleum industry, which is studying the matter. The necessary butadiene can be produced as a by-product in the 100-octane gasoline plants now being constructed to provide aviation gasoline. The butadiene can be extracted, Dr. Weidlein pointed out, without reducing the amount of aviation gasoline produced or restricting the output of other petroleum products. If this production is in sight by July of this year, the second 200,000 tons of synthetic rubber can be ready to go into production by mid-1943, he said.

Experimentation will continue during production and it is expected improvements in synthetic rubber will be made. Present outlook is for a product that is 95 per cent as efficient as crude rubber for automobile tires and superior to crude for some other uses. Some variations in formula will be made in various plants, Dr. Weidlein explained, as experiments go forward. Certain types apparently are superior for inner tubes, for instance, and these variations will be made.

The entire program is expected to result in the construction of about 20 new plants for both raw materials and finished products. Four synthetic rubber plants are under construction and two more will be started soon. Three or possibly four more will be necessary for the entire 400,000 tons of synthetic rubber.

Rules on Hydrochloric Acid Transportation Revised

AS A STEP in the Government's all-out war effort, Wayne Chatfield Taylor, Under Secretary of Commerce, has issued an order authorizing the transportation of hydrochloric acid in bulk in tanks on board vessels. This action was taken to ensure adequate supplies of this acid to the vitally important new tin plants created by the Defense Plant Corporation.

Under the order, which amends regulations governing the handling, storage, and stowage of explosives and other dangerous articles on vessels, hydrochloric acid can be shipped in rubber-lined tanks of 18,000 gallons capacity. Barges with a total capacity of 110,000 gallons in six tanks are under construction for use in this service.

Wholesale Price Indexes

INDEX numbers of wholesale prices for chemicals and allied products in September and October 1941 have been released by the United States Department of Labor. With the year 1926 at 100, the indexes were:

PRODUCT	OCT. 1941	SEPT. 1941	OCT. 1940
Chemicals and allied products	89.7	87.4	76 9
Chemicals	88.4	88.2	85 0
Drugs and pharmaceuticals	124.1	104 4	95.8
Fertilizer materials	77.3	76 6	68.1
Mixed fertilizers	77.5	77 1	74.2
Oils and fats	93 4	91.3	39.8

Lead Consumption for 1941 Exceeds Industry's Peak

IN 1941 the apparent consumption of lead in the United States increased 25 per cent over 1940 to reach proportions higher than any of the earlier boom years, 1925–29, according to the U. S. Bureau of Mines. Of the quantity used in 1941 a higher proportion was probably from foreign sources than since establishment of the domestic industry. An increase of nearly 60 per cent in imports of refined lead is indicated for 1941 over the previous record year of 1940. Smelter output from domestic ores and base bullion was 9 per cent higher than in 1940 and the largest since 1930, but production from foreign ores and bullion decreased 3 per cent. Exports of refined lead fell 63 per cent from the 1940 rate. The average quoted price for lead of 5.79 cents was nearly 12 per cent above 1940.

Producers' stocks of refined lead increased from 40,926 tons on January 1 to 47,248 tons at the end of the month. For subsequent months shipments, although fluctuating, remained greater than production, and stocks showed a continual

decline to a record low of 10,735 tons on October 31. November production increased and, as this gain was in excess of a similar rise in shipments, stocks increased to 13,671 tons by the end of November and refinery inventories were only 33 per cent of those at the end of 1940.

Bauxite Production, Imports, Consumption Reach Peak

PRODUCTION of bauxite in the United States in 1941 exceeded the previous peak reached in 1918 by nearly 50 per cent and surpassed the output of 1940 by 105 per cent, according to preliminary figures compiled by the U. S. Bureau of Mines. Output in 1941 totaled an estimated 899,500 long tons, compared with only 438,913 tons in 1940.

Imports of bauxite during the first nine months of 1941 totaled 749,264 tons, considerably greater than ever received during any previous full 12-month period. Domestic production and importations in 1942 are expected to greatly surpass those of 1941. Consumption of bauxite in the United States also broke all records and is estimated at approximately 1,700,000 tons compared with 1,072,000 in 1940. The aluminum industry is said to have consumed about 70 per cent of this bauxite and the chemical, abrasive (including American-owned plants in Canada), and other industries about 16, 12, and 2 per cent, respectively. No reliable figures are available at this time on the value of bauxite shipped. Probably the value on all grades of domestic ore shipped in 1941 more than doubled the $2,578,968 of 1940.

Regulation of Dangerous Drug Products Increased

ELIMINATION of filthy food from the market, prosecution of the responsible manufacturers and shippers, and educational work in improved sanitary factory practices featured enforcement of the Federal Food, Drug, and Cosmetic Act during 1941, reports W. G. Campbell, commissioner of food and drugs. The fiscal year 1941 was the first complete year in which all provisions of the act of 1938 were in effect.

In enforcement of the act there were examined 944 samples of cosmetics, 9,823 of drugs and devices, and 36,380 of foods. Prosecutions to the number of 1,155 were instituted and 2,016 seizures were effected, while 2,605 consignments from foreign countries were denied entry. An increased number of court actions involving shipment of misbranded proprietary medicines were brought. False and misleading therapeutic claims for a variety of diseases and inadequate warning statements were responsible for most of the actions.

Chemical Manufacturers' Shipments and Inventories

THE November index of the value of chemical manufacturers' shipments was 175, compared with 182 in October and 130 in November 1940, taking January 1939 at 100, according to the monthly industry survey of the U. S. Department of Commerce.

The November index of the value of chemical manufacturers' inventories was 131.7, compared with 128.2 in October and 113.3 in November 1940, taking 1939 at 100.

Record Use of Copper in 1941

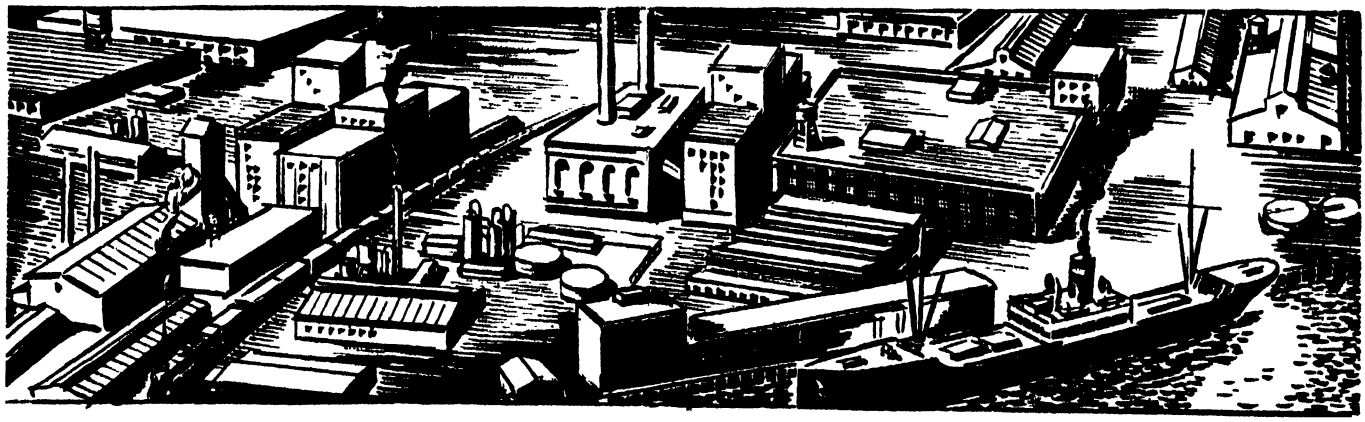
DEMAND for copper was unprecedented in 1941, reports the U. S. Bureau of Mines. The record-breaking use was to fill armament requirements of the United States and to aid in supplying war needs of foreign countries entitled to help under the Lend-Lease Act.

The enormous use of the metal during the year was accompanied by an unchanged price and by increase in smelter production from domestic sources of only 8 per cent. Imports of crude and refined metal established a new annual record, while exports of refined copper and primary fabricated shapes apparently were the smallest since 1901.

Refinery production of new copper from domestic sources gained 4 per cent in 1941 and that from foreign sources was 10 per cent higher, accounting for a rise in total new copper of 6 per cent. Production of refined copper from foreign sources reached a new annual peak in the past year.

Chlorine to Be Available for Water Purification

NECESSARY amounts of chlorine for water purification will be provided throughout the Nation despite the general chlorine shortage, the Chemicals and Allied Products Branch, War Production Board, has announced. Chlorine in all forms for potable water and sewage treatment is given a high preference over civilian and some war uses to permit water and sewage plants to obtain necessary chlorine and sodium hypochlorite supplies.



High-test calcium hypochlorite and calcium chloride are at present more scarce than chlorine and sodium hypochlorite. For that reason, the Chemicals and Allied Products Branch says, plants which use these materials may be forced to change to one of the latter. This will not impair sterilization efficiency.

Lead and Zinc Production

IN 1941 the total mine production of recoverable lead and zinc in the United States and Alaska, including that made into pigments and chemicals direct from ore, was 459,756 short tons of lead and 735,865 of zinc, the U. S. Bureau of Mines reports. These figures compare with a production of 457,392 tons of lead and 665,068 tons of zinc in 1940 and show that there were increases in 1941 of less than 1 per cent in output of lead and of 11 per cent in zinc. Total value of the metals in 1941, calculated at the average weighted prices used by the bureau of $0.056 per pound for lead and $0.076 per pound for zinc, was $51,492,672 for lead and $111,851,480 for zinc.

Mine Production of Copper

COPPER production from domestic mines, including Alaska, was 78,001 short tons in November, a decrease of 5.53 per cent from that of October, according to the U. S. Bureau of Mines. Total copper output for 11 months in 1941 was 880,138 tons. Adding preliminary figures for December of 79,368 tons, the total production for 1941 will be about 959,506 tons, an increase over 1940 of 9.3 per cent.

Society Officers, Committees, and Student Affiliate Chapters

Officers

THE list of officers of the SOCIETY appears in CHEMICAL AND ENGINEERING NEWS three times a year, usually February 10, May 10, and October 10.

National Officers and Directors

PRESIDENT. Harry N. Holmes, Severance Chemical Laboratory, Oberlin College, Oberlin, Ohio.

PRESIDENT-ELECT. Per K. Frolich, Standard Oil Development Co., Box 243, Elizabeth, N. J.

SECRETARY AND BUSINESS MANAGER. Charles L. Parsons, AMERICAN CHEMICAL SOCIETY BUILDING, 1155 16th St., N. W., Washington, D. C. *Assistant Manager*, Alden H. Emery.

TREASURER. Robert T. Baldwin, 50 East 41st St., New York, N. Y.

DIRECTORS. *Ex Officio*, the President, the President-Elect, the most recent Past President (William Lloyd Evans), the Secretary, and the Treasurer. *Regional*, L. H. Adams, R. E. Swain (1940–42); Roger Adams, R. E. Wilson (1941-43); Arthur J. Hill, E. R. Weidlein (1942–44). *At-Large*, Thomas Midgley, Jr. (1939–42); E. K. Bolton (1940–43); Willard H. Dow (1941–44); Charles A. Thomas (1942–45).

COUNSEL. Elisha Hanson.

Editors

JOURNAL OF THE AMERICAN CHEMICAL SOCIETY. Arthur B. Lamb, Chemical Laboratories, Harvard University, 12 Oxford St., Cambridge, Mass.

CHEMICAL ABSTRACTS. E. J. Crane, Ohio State University, Columbus, Ohio. *Assistant Editor*, Elmer Hockett.

INDUSTRIAL AND ENGINEERING CHEMISTRY and CHEMICAL AND ENGINEERING NEWS. H. E. Howe, 1155 16th St., N. W., Washington, D. C. *Assistant to Editor*, N. A. Parkinson.

PUBLICATION MANAGER. Harvey F. Mack, 20th and Northampton Streets, Easton, Penna.

NEWS SERVICE. *Director*, H. E. Howe, 1155 16th St., N. W., Washington, D. C. *Managing Editor*, James T. Grady, 609 Journalism Bldg., Columbia University, New York, N. Y.

SCIENTIFIC MONOGRAPHS. H. E. Howe (*Acting Editor*), 1155 16th St., N. W., Washington, D. C.

TECHNOLOGIC MONOGRAPHS. H. E. Howe, 1155 16th St., N. W., Washington, D. C.

CHEMICAL REVIEWS. W. Albert Noyes, Jr., Department of Chemistry, University of Rochester, River Campus, Rochester, N. Y.

Assistant Editor, Louise Kelley. Published by Williams & Wilkins Co., Baltimore, Md.

JOURNAL OF PHYSICAL CHEMISTRY. Samuel C. Lind, School of Chemistry, University of Minnesota, Minneapolis, Minn. *Assistant Editor*, Louise Kelley. Published by Williams & Wilkins Co., Baltimore, Md.

Members of Council

EX OFFICIO. *National Officers. Directors. Editors* of the *Journal of the American Chemical Society*, *Chemical Abstracts*, and *Industrial and Engineering Chemistry*. *Past Presidents*, Roger Adams, L. H. Baekeland, W. D. Bancroft, Edward Bartow, M. T. Bogert, Wm. Lloyd Evans, Moses Gomberg, C. A. Kraus, Arthur B. Lamb, Irving Langmuir, S. C. Lind, William McPherson, L. V. Redman, E. R. Weidlein, F. C. Whitmore, W. R. Whitney. *Chairmen of Divisions and Councilors of Local Sections* (listed under Divisional and Local Section Officers).

Councilors-at-Large. Per K. Frolich, Edward Mack, Jr., C. E. K. Mees, W. Albert Noyes, Jr. (1940-42); Wm. Mansfield Clark, J. H. Hildebrand, G. E. F. Lundell, Charles A. Thomas (1941–43); George D. Beal, Gustav Egloff, Henry Gilman, Carl S. Marvel (1942–44).

Divisional Officers

AGRICULTURAL AND FOOD. *Chairman*, Ellery H. Harvey; *Secretary*, Roger H. Lueck, Research Department, American Can Co., Maywood, Ill.

ANALYTICAL AND MICRO. *Chairman*, George L. Royer; *Secretary*, Francis W. Power, S.J., Fordham University, New York, N. Y.

BIOLOGICAL. *Chairman*, B. H. Nicolet; *Secretary*, Erwin Brand, 630 West 168th St., New York, N. Y.

CELLULOSE. *Chairman*, Elwin E. Harris; *Secretary*, Charles R. Fordyce, 275 Maplewood Drive, Rochester, N. Y.

CHEMICAL EDUCATION. *Chairman*, F. E. Brown; *Secretary*, Paul H. Fall, Hiram College, Hiram, Ohio.

COLLOID. *Chairman*, Fredrich Olsen; *Secretary*, J. W. McBain, 571 Foothill, Stanford University, Calif.

FERTILIZER. *Chairman*, H. B. Sioms; *Secretary*, Charles A. Butt, International Agricultural Corp., East Point, Ga.

GAS AND FUEL. *Chairman*, Orin W. Rees; *Secretary*, G. R. Yohe, State Geological Survey, Urbana, Ill.

HISTORY OF CHEMISTRY. *Chairman*, Harrison Hale; *Secretary*, Ralph E. Oesper, Department of Chemistry, University of Cincinnati, Cincinnati, Ohio.

INDUSTRIAL AND ENGINEERING CHEMISTRY, *Chairman*, Lawrence W. Bass; *Secretary*. Whitney Weinrich, Gulf Research & Development Co., Box 2038, Pittsburgh, Penna.

MEDICINAL CHEMISTRY. *Chairman*, John H. Gardner; *Secretary*, John H. Speer, 4737 Ravenswood Ave., Chicago, Ill.

ORGANIC. *Chairman*, Lee I. Smith; *Secretary*, Arthur C. Cope, Department of Chemistry, Columbia University, New York, N. Y.

PAINT, VARNISH, AND PLASTICS. *Chairman*, Shailer L. Bass; *Secretary*, Adolf C. Elm, The New Jersey Zinc Co., Box 263, Palmerton, Penna.

PETROLEUM. *Chairman*, J. K. Roberts; *Secretary*, Cary R. Wagner, The Pure Oil Co., 35 East Wacker Drive, Chicago, Ill.

PHYSICAL AND INORGANIC. *Chairman*, W. C. Fernelius; *Secretary*, Oscar K. Rice, Department of Chemistry, University of North Carolina, Chapel Hill, N. C.

RUBBER. *Chairman*, John N. Street; *Secretary*, Howard I. Cramer, Sharples Chemicals, Inc., 23rd and Westmoreland Streets, Philadelphia, Penna.

SUGAR CHEMISTRY AND TECHNOLOGY. *Chairman*, Sidney M. Cantor; *Secretary*, E. Whitman Rice, National Sugar Refining Co., 129 Front St., New York, N. Y.

WATER, SEWAGE, AND SANITATION. *Chairman*, Charles S. Howard; *Secretary*, H. Gladys Swope, North Shore Sanitary District, Dahringer Road, Waukegan, Ill.

Local Section Officers

AKRON. *Chairman*, Winfield Scott; *Secretary*, Albert J. Gracia, 1639 Ohio St., Cuyahoga Falls, Ohio; *Councilors*, W. I. Burt, E. G. Haas, M. M. Harrison, C. K. Novotny.

ALABAMA. *Chairman*, George D. Palmer; *Secretary*, Harold E. Wilcox, 7837 Fifth Ave., South, Birmingham, Ala.; *Councilors*, S. S. Heide, J. T. Vann.

AMES. *Chairman*, Henry A. Webber; *Secretary*, Harvey C. Diehl, Department of Chemistry, Iowa State College, Ames, Iowa; *Councilors*, N. A. Clark, L. A. Underkofler.

BATON ROUGE. *Chairman*, Arthur G. Keller; *Secretary*, Sumner B. Sweetser, 2960 Hyacinth Ave., Baton Rouge, La.; *Councilors*, C. L. Brown, A. R. Choppin.

BINGHAMTON. *Chairman*, August H. Brunner, Jr.; *Secretary*, Frank J. Kassuba, 100 Gilmore Ave., R. D. 3, Binghamton, N. Y.; *Councilor*, Maurice Dorfman.

CALIFORNIA. *Chairman*, Paul F. Bovard; *Secretary*, Sterling L. Redman, 585 Howard St., San Francisco, Calif.; *Councilors*, Ross Cummings, T. C. Daniels, Dozier Finley, William Hirschkind, L. B. Howard, C. R. Noller, Merle Randall, L. V. Steck, Frank Wills.

CENTRAL PENNSYLVANIA. *Chairman*, Arthur Rose; *Secretary*, N. B. Guerrant, Department of Biochemistry, Pennsylvania

State College, State College, Penna.; *Councilors*, R. A. Dutcher, C. C. Wright.

CENTRAL TEXAS. *Chairman*, W. A. Cunningham; *Secretary*, Maxwell A. Pollack, Chemistry Department, The University of Texas, Austin, Tex.; *Councilors*, H. R. Henze, H. L. Lochte.

CHICAGO. *Chairman*, Warren C. Johnson; *Secretary*, James J. Doheny, Jr., 4247 West End Ave., Chicago, Ill.; *Councilors*, Howard Adler, E. B. Carter, Victor Conquest, J. J. Doheny, Jr., W. V. Evans, B. B. Freud, Arthur Guillaudeu, L. M. Henderson, W. F. Henderson, C. D. Hurd, W. C. Johnson, M. C. Morrell, R. C. Newton, H. E. Robinson, M. C. Rogers, B. E. Schaar, H. I. Schlesinger, E. H. Volwiler, C. R. Wagner, R. E. Zinn.

CINCINNATI. *Chairman*, Frederick E. Holmes; *Secretary*, Ronald C. Stillman, 1578 Reid Ave., Cincinnati, Ohio; *Councilors*, R. F. Brown, D. J. Kooyman, R. E. Oesper, C. C. Ruchhoft.

CLEVELAND. *Chairman*, Eric A. Arnold; *Secretary*, M. R. Hatfield, Research Laboratory, National Carbon Co., Cleveland, Ohio; *Councilors*, E. A. Arnold, H. S. Booth, G. H. McIntyre, J. C. Weaver.

COLORADO. *Chairman*, H. B. Van Valkenburgh; *Secretary*, Robert W. Virtue, University of Denver, Denver, Colo.; *Councilors*, W. W. Howe, S. A. Powell.

COLUMBUS. *Chairman*, Richard S. Shutt; *Secretary*, Melvin S. Newman, Department of Chemistry, Ohio State University, Columbus, Ohio; *Councilors*, C. E. Boord, W. A. Manuel, M. L. Wolfrom.

CONNECTICUT VALLEY. *Chairman*, Samuel E. Q. Ashley; *Secretary*, Harold S. Schwenk, University of Connecticut, Storrs, Conn.; *Councilors*, R. D. Dunlop, G. A. Hill, M. L. Sherrill.

CORNELL. *Chairman*, Albert W. Laubengayer; *Secretary*, William T. Miller, Jr., Department of Chemistry, Cornell University, Ithaca, N. Y.; *Councilor*, John R. Johnson.

DALLAS-FORT WORTH. *Chairman*, Manuel H. Gorin; *Secretary*, J. M. Hersh, Magnolia Petroleum Co., 1920 McKinney Ave., Dallas, Tex.; *Councilors*, W. H. Clark, J. L. Whitman.

DAYTON. *Chairman*, Nicholas N. T. Samaras; *Secretary*, Vincent J. Wottle, University of Dayton, Dayton, Ohio; *Councilors*, M. E. Haas, A. M. Patterson.

DELAWARE. *Chairman*, Samuel Lenher; *Secretary*, S. S. Rossander, 1502 Woodsdale Road, Bellevue Manor, Wilmington, Del.; *Councilors*, R. F. Conaway, M. A. Dahlen, H. R. Dittmar, Quaesita C. Drake, G. G. Lahr, Emil Ott, M. T. Sanders.

DETROIT. *Chairman*, Horace H. Bliss; *Secretary*, Frances W. Lamb, 17140 Third Ave., Detroit, Mich.; *Councilors*, George Calingaert, J. J. Jasper, Helen I. Miner, Arthur Rautenberg, L. A. Sweet, T. H. Vaughn.

EAST TENNESSEE. *Chairman*, Robert R. Ralston; *Secretary*, Eric Winters, Department of Agronomy, University of Tennessee, Knoxville, Tenn.; *Councilor*, J. H. Wood.

EASTERN NEW YORK. *Chairman*, Francis J. Norton; *Secretary*, E. K. Bacon, Chemical Laboratory, Union College, Schenectady, N. Y.; *Councilors*, H. M. Faigenbaum, Arthur Knudson.

ERIE. *Chairman*, William F. Reichert; *Secretary*, Christian H. Steinford, 23 Horton St., Erie, Penna.; *Councilor*, Sister Doloretta Thorn.

FLORIDA. *Chairman*, Isabel McKinnell; *Secretary*, R. B. French, Agricultural Experiment Station, University of Florida, Gainesville, Fla.; *Councilors*, J. P. Bain, A. T. Cole.

GEORGIA. *Chairman*, John J. McManus; *Secretary*, R. A. Day, Jr., Chemistry Building, Emory University, Emory University, Ga.; *Councilors*, J. S. Guy, H. M. Waddle.

HAWAII. *Chairman*, Earl M. Bilger; *Secretary*, Ronald Q. Smith, 3753 Sierra Drive, Honolulu, T. H.; *Councilor*, J. H. Payne.

ILLINOIS-IOWA. *Chairman*, Arthur N. Johnson; *Secretary*, M. R. Hoppe, Parr Instrument Co., Moline, Ill.; *Councilor*, J. F. Goggin.

INDIANA. *Chairman*, Neil Kershaw; *Secretary*, John A. Leighty, 4301 East 38th St., Indianapolis, Ind.; *Councilors*, J. E. Hutchman, E. H. Niles, J. L. Riebsomer, E. H. Stuart.

IOWA. *Chairman*, L. C. Raiford; *Secretary*, Joseph I. Routh, Chemistry Building, State University of Iowa, Iowa City, Iowa; *Councilor*, Wm. G. Eversole.

KANAWHA VALLEY. *Chairman*, Ashby C. Blackwell; *Secretary*, Alfred W. Downes, 506 Highland Ave., South Charleston, W. Va.; *Councilors*, H. L. Cox, J. N. Wickert.

KANSAS CITY. *Chairman*, Herbert M. Steininger; *Secretary*, Clarence W. Sondern, George A. Breon & Co., Inc., Box 769, Kansas City, Mo.; *Councilors*, H. P. Brown, R. Q. Brewster.

KANSAS STATE COLLEGE. *Chairman*, A. C. Andrews; *Secretary*, Alfred T. Perkins, Kansas State College, Manhattan, Kans.; *Councilor*, H. H. King.

LEHIGH VALLEY. *Chairman*, R. Graham Cook; *Secretary*, W. H. Holst, Box 175, Tamaqua, Penna.; *Councilors*, E. A Engle, H. A. Neville, C. D. Pratt.

LEXINGTON. *Chairman*, Julian H. Capps; *Secretary*, Martin E. Weeks, Experiment Station, University of Kentucky, Lexington, Ky.; *Councilor*, W. A. Hensley.

LOUISIANA. *Chairman*, A. W. Chapman; *Secretary*, Worden Waring, Department of Chemistry, College of Arts and Sciences, Tulane University, New Orleans, La.; *Councilors*, H. A. Levey, H. P. Newton.

LOUISVILLE. *Chairman*, Paul A. Kolachov; *Secretary*, Richard B. Ellis, Joseph E. Seagram & Sons, Inc., Louisville, Ky.; *Councilors*, R. C. Ernst, A. W. Homberger.

MAINE. *Chairman*, Samuel E. Kamerling; *Secretary pro tem.*, Wm. C. Root, 80 Federal St., New Brunswick, Maine; *Councilor*, F. T. Martin.

MARYLAND. *Chairman*, Paul H. Emmett; *Secretary*, Edward S. Hopkins, Montebello Filters, Hillen Road, Baltimore, Md.; *Councilors*, A. H. Corwin, W. H. Hartung, Duncan MacRae, S. B. Schofield.

MEMPHIS. *Chairman*, Thomas P. Nash, Jr.; *Secretary*, E. F. Williams, 874 Union Ave., Memphis, Tenn.; *Councilor*, J. R. Meadow.

MICHIGAN STATE COLLEGE. *Chairman*, C. D. Ball, Jr.; *Secretary*, Clifford W. Duncan, 618 Butterfield Drive, East Lansing, Mich.; *Councilor*, D. T. Ewing.

MIDLAND. *Chairman*, J. D. Hanawalt; *Secretary*, John J. Grebe, Dow Chemical Co., Midland, Mich.; *Councilors*, E. C. Britton, W. R. Veazey.

MILWAUKEE. *Chairman*, Robert R. Austin; *Secretary*, Robert O. Guettler, 3710 North Morris Blvd., Shorewood, Wis.; *Councilors*, N. A. Thomas, H. H. Tucker.

MINNESOTA. *Chairman*, G. O. Burr; *Secretary*, T. Ivan Taylor, Chemistry Department, University of Minnesota, Minneapolis, Minn.; *Councilors*, C. G. Ferrari, W. M. Lauer, R. E. Montonna.

MONTANA. *Chairman*, John F. Suchy; *Secretary*, Ray Woodriff, Chemistry Department, Montana State College, Bozeman, Mont.; *Councilor*, O. E. Sheppard.

NASHVILLE. *Chairman*, W. P. Fishel; *Secretary*, Hanor A. Webb, Department of Chemistry, George Peabody College for Teachers, Nashville, Tenn.; *Councilor*, W. C. Sumpter.

NEBRASKA. *Chairman*, Carl E. Georgi; *Secretary*, Norman H. Cromwell, Department of Chemistry and Chemical Engineering, University of Nebraska, Lincoln, Nebr.; *Councilor*, E. R. Washburn.

NEW HAVEN. *Chairman*, Herbert S. Harned; *Secretary*, Harding Bliss, Sterling Chemistry Laboratory, Yale University, New Haven, Conn.; *Councilors*, Clinton Doede, C. C. Furnas.

NEW YORK. *Chairman*, Ralph H. Müller; *Secretary*, Cornelia T. Snell, 66 Park Ave., New York, N. Y.; *Councilors*, M. Irene Bailey, H. H. Baker, Jr., R. A. Baker, J. J. Beaver, A. T. Burtsell, W. E. Cass, C. R. Dawson, M. E. Droz, E. J. Durham, V. du Vigneaud, R. C. Elderfield, A. S. Elsenbast, W. H. Gardner, S. F. Gaffin, R. G. Gould, Jr., H. W. Hermance, H. A. Horan, W. R. Johnston, D. H. Killoffer, S. D. Kirkpatrick, F. S. Low, S. P. Miller, W. F. O'Connor, Donald Price, W. M. Ralph, E. W. Rice, F. D. Snell, A. H. Tenney, L. A. Wooten.

NORTH CAROLINA. *Chairman*, Ivan D. Jones; *Secretary*, Sherman E. Smith, Department of Chemistry, University of North Carolina, Chapel Hill, N. C.; *Councilors*, R. W. Bost, P. M. Gross.

NORTH JERSEY. *Chairman*, Delmer L. Cottle; *Secretary*, Henry J. Wing, 21 Elm Place, Milltown, N. J.; *Councilors*, C. R. Addinall, E. R. Allen, J. B. Austin, J. A. Bradley, A. E. Brooks, F. E. Carruth, Thomas Cifelly, Jr., M. L. Crossley, H. F. Jordan, R. H. Kienle, R. T. Major, R. J. Moore, S. O. Morgan, E. B. Peck, R. D. Reed, William Rieman, III, H. F. Wakefield, R. E. Waterman.

NORTHEAST TENNESSEE. *Chairman*, Matthew Weber, Jr.; *Secretary*, Joseph H. Brant, Research and Development Division, Tennessee Eastman Corp., Kingsport, Tenn.; *Councilor*, J. R. Caldwell.

NORTHEAST WISCONSIN. *Chairman*, J. O. Frank; *Secretary*, Joseph Ackerman, 413 Eighth St., Neenah, Wis.; *Councilor*, H. F. Lewis.

NORTHEASTERN. *Chairman*, Avery A. Ashdown; *Secretary*, Alberto F. Thompson, Jr., Eastman Chemical Laboratory, Massachusetts Institute of Technology, Cambridge, Mass.; *Councilors*, G. R. Alden, C. M. Alter, C. P. Baker, A. A. Blanchard, T. M. Carpenter, F. C. Howard, H. A. Iddles, Grinnell Jones, A. A. Morton, Deborah Russell, Florence C. Sargent.

NORTHERN WEST VIRGINIA. *Chairman*, A. J. W. Headlee; *Secretary*, P. Lloyd MacLachlan, Department of Biochemistry, Medical School, West Virginia University, Morgantown, W. Va.; *Councilor*, I. J. Duncan.

NORTHWESTERN UTAH. *Chairman*, John R. Lewis; *Secretary*, G. Victor Beard, Chemistry Department, University of Utah, Salt Lake City, Utah; *Councilor*, W. D. Bonner.

OKLAHOMA. *Chairman*, Harold M. Smith; *Secretary*, L. F. Sheerar, Department of Chemical Engineering, Oklahoma A. & M.

College, Stillwater, Okla.; *Councilors*, B. C. Frichot, J. P. Jones, B. W. Logue.

OMAHA. *Chairman*, Wm. Dean Yohe; *Secretary*, R. R. Briggs, Nebraska Power Co., Omaha, Nebr.; *Councilor*, C. L. Kenny.

OREGON. *Chairman*, Glenn C. Ware; *Secretary*, Francis T. Jones, 210 North A St., Forest Grove, Oreg.; *Councilor*, C. S. Pease.

PANHANDLE PLAINS. *Chairman*, W. M. Deaton; *Secretary*, E. M. Frost, Jr., 815 Fairmont St., Amarillo, Tex.; *Councilor*, R. G. Atkinson.

PENNSYLVANIA–NEW YORK WESTERN BORDER. *Chairman*, Russell E. Palmateer; *Secretary*, Everett J. Schneider, 236 West Fourth St., Emporium, Penna.; *Councilor*, R. W. Hufferd.

PEORIA. *Chairman*, Gerald C. Baker; *Secretary*, L. Gerber, 601 Linn St., Peoria, Ill.; *Councilors*, R. I. Claassen, R. D. Coghill.

PHILADELPHIA. *Chairman*, S. W. Ferris; *Secretary*, Lyle L. Jenne, 825 City Hall Annex, Philadelphia, Penna.; *Councilors*, R. A. Connor, J. L. Crenshaw, J. W. E. Harrisson, J. B. Hill, L. C. Hurd, W. G. Karr, H. S. Lukens, W. B. Meldrum, Arthur Osol, H. C. Porter, William Stericker, L. D. Stratton, F. T. Tyson.

PITTSBURGH. *Chairman*, J. C. Warner; *Secretary*, Ralph W. Bridges, Aluminum Research Laboratories, Box 772, New Kensington, Penna.; *Councilors*, F. W. Adams L. H. Almy, H. V. Churchill, L. H. Cretcher, J. D. Edwards, C. G. King, J. N. Roche, E. K. Wallace, W. P. Yant.

PRINCETON. *Chairman*, Hubert N. Alyea; *Secretary*, John F. Lane, Frick Chemical Laboratory, Princeton University, Princeton, N. J.; *Councilor*, H. S. Taylor.

PUGET SOUND. *Chairman*, W. L. Bouschlein; *Secretary*, Victorian Siverts, Department of Chemistry, University of Washington, Seattle, Wash.; *Councilors*, A. L. Kniseley, R. J. Robinson.

PURDUE. *Chairman*, F. D. Martin; *Secretary*, Fred J. Allen, Chemistry Department, Purdue University, West Lafayette, Ind.; *Councilor*, M. G. Mellon.

RHODE ISLAND. *Chairman*, Dana Burks, Jr.; *Secretary*, W. George Parks, Department of Chemistry, Rhode Island State College, Kingston, R. I.; *Councilors*, P. C. Cross, J. P. Howe.

ROCHESTER. *Chairman*, Harold C. Hodge; *Secretary*, Thomas F. Murray, Jr., Research Laboratories, Eastman Kodak Co., Rochester, N. Y.; *Councilors*, F. R. Baxter, E. K. Carver. R. W. Helmkamp, D. K. Tressler.

SACRAMENTO. *Chairman*, C. E. Larson; *Secretary*, L. M. Lampert, State Office Building No. 1, Sacramento, Calif.; *Councilor*, F. W. Bunyan.

ST. JOSEPH VALLEY. *Chairman*, Henry J. Klooster; *Secretary*, P. A. McCusker, Chemistry Department, University of Notre Dame, Notre Dame, Ind.; *Councilor*, H. B. Froning.

ST. LOUIS. *Chairman*, Fredrich Olsen; *Secretary*, Henry A. Carlton, Mallinckrodt Chemical Works, 3600 North Second St., St. Louis, Mo.; *Councilors*, H. L. Dahm, P. A. Krueger, LeRoy McMaster, R. B. Semple, L. J. Wood.

SAN DIEGO. *Chairman*, Ambrose R. Nichols, Jr.; *Secretary*, Viola Sommermeyer, 301 Medico Dental Bldg., San Diego, Calif.; *Councilor*, D. E. Clark.

SIOUX VALLEY. *Chairman*, A. R. Hershberger; *Secretary*, Ernest Griswold, Department of Chemistry, University of South Dakota, Vermillion, S. Dak.; *Councilor*, L. S. Guss.

SOUTH CAROLINA. *Chairman*, J. A. Southern; *Secretary*, Willard A. Whitesell, 307 Southwood Road, Columbia, S. C.; *Councilor*, J. E. Mills.

SOUTH JERSEY. *Chairman*, H. L. Jones; *Secretary*, Joseph W. Lang, Woodstown, N. J.; *Councilors*, W. S. Calcott, J. M. Tinker.

SOUTHEAST KANSAS. *Chairman*, Everett J. Ritchie; *Secretary*, O. W. Chapman, Chemistry Department, Kansas State Teachers College, Pittsburg, Kans.; *Councilor*, J. H. Davidson.

SOUTHEAST TENNESSEE. *Chairman*, Emerson P. Poste; *Secretary*, William O. Swan, University of Chattanooga, Chattanooga, Tenn.; *Councilor*, I. W. Grote.

SOUTHEASTERN PENNSYLVANIA. *Chairman*, Edmund Claxton; *Secretary*, H. A. Reehling, Revonah Spinning Mills, Hanover, Penna.; *Councilor*, R. W. Higgins.

SOUTHEASTERN TEXAS. *Chairman*, M. C. Van Gundy; *Secretary*, E. P. Doremus, Jr., Research Laboratory, Shell Refinery, Deer Park, Tex.; *Councilors*, I. S. Cliff, A. J. Hartsook, R. H. Price.

SOUTHERN CALIFORNIA. *Chairman*, Wm. G. Young; *Secretary*, Harry V. Welch, Western Precipitation Co., 1016 West Ninth St., Los Angeles, Calif.; *Councilors*, G. A. Alles, L. R. Brantley, W. A. Bush, H. N. McCoy, L. C. Pauling, J. B. Ramsey, R. W. Truesdail.

SYRACUSE. *Chairman*, Edwin C. Jahn; *Secretary*, Frank Porter, Solvay Process Co., Nitrogen Division, Syracuse, N. Y.; *Councilors*, A. L. Elder, P. A. Keene.

TEXAS A. & M. *Chairman*, J. D. Lindsay; *Secretary*, G. S. Fraps, College Station, Tex.; *Councilor*, H. H. Garretson.

TOLEDO. *Chairman*, Harold F. Stose; *Secretary*, John J. Thornton, De Sales College, Toledo, Ohio; *Councilor*, J. H. Toulouse.

UNIVERSITY OF ILLINOIS. *Chairman*, B. S. Hopkins; *Secretary*, H R. Snyder, 210 Noyes Laboratory, University of Illinois, Urbana, Ill.; *Councilors*, L. F. Audrieth, R. E. Greenfield, G. F. Smith.

UNIVERSITY OF MICHIGAN. *Chairman*, L. O. Case; *Secretary*, Lawrence O. Brockway, Department of Chemistry, University of Michigan, Ann Arbor, Mich.; *Councilor*, H. H. Willard.

UNIVERSITY OF MISSOURI. *Chairman*, L. D. Haigh; *Acting Secretary*, F. Emmett Jacob, Jr., 2110 Schweitzer Hall, University of Missouri, Columbia, Mo.; *Councilor*, H. E. French.

VIRGINIA. *Chairman*, A. Berne-Allen, Jr.; *Secretary*, E. S. Harlow, The American Tobacco Co., Box 4178, Richmond, Va.; *Councilors*, R. C. Berry, W. C. Jones, S. S. Negus.

VIRGINIA BLUE RIDGE. *Chairman*, C. L. Crockett; *Secretary*, B. W. Waring, Chemical Laboratory, Norfolk & Western Railway, Roanoke, Va.; *Councilor*, J. W. Watson.

WASHINGTON. *Chairman*, Norman Bekkedahl; *Secretary*, Edgar R. Smith, National Bureau of Standards, Washington, D. C.; *Councilors*, W. D. Collins, N. L. Drake, H. L. J. Haller, R. M. Hann, J. H. Hibben, F. O. Rice, F. D. Rossini, M. X. Sullivan, E. Wichers.

WASHINGTON–IDAHO BORDER. *Chairman*, E. V. White; *Secretary*, Andrew van Hook, Department of Chemistry, University of Idaho, Moscow, Idaho; *Councilor*, R. W. Gelbach.

WESTERN CONNECTICUT. *Chairman*, R. Bowling Barnes; *Secretary*, William C. Moore, 42 Chesterfield Road, Shippan Point, Stamford, Conn.; *Councilors*, H. L. Fisher, Lois W. Woodford.

WESTERN MARYLAND. *Chairman*, John L. Baggett; *Secretary*, Dustin Y. Miller, 418 Avirett Ave., Cumberland, Md.; *Councilor*, G. W. Seymour.

WESTERN NEW YORK. *Chairman*, Wilmer H. Koch; *Secretary*, Nelson Allen, E. I. du Pont de Nemours & Co., Inc., Station B, Buffalo, N. Y.; *Councilors*, W. K. Eglof, W. L. Hyden, C. J. Kinzie, H. W. Post, C. H. Rasch, M. C. Taylor.

WESTERN VERMONT. *Chairman*, E. B. Womack; *Secretary*, Constance L. Brown, Williams Science Hall, University of Vermont, Burlington, Vt.; *Councilor*, H. C. Hamilton.

WICHITA. *Chairman*, W. E. Perdew; *Secretary*, L. A. Enberg, East Plant No. 2, Carey Salt Co., Hutchinson, Kans.; *Councilor*, R. E. Puckett.

WILSON DAM. *Chairman*, G. L. Bridger; *Secretary*, Robert A. Wilson, Box 1364, Wilson Dam, Ala.; *Councilor*, J. W. H. Aldred.

WISCONSIN. *Chairman*, John W. Williams; *Secretary*, Joseph O. Hirschfelder, Department of Chemistry, University of Wisconsin, Madison, Wis.; *Councilors*, Homer Adkins, N. F. Hall.

WOOSTER (Ohio). *Chairman*, Milton P. Puterbaugh; *Secretary*, John W. Chittum, 722 N. Bever St., Wooster, Ohio; *Councilor*, R. I. Grady.

Committees

(April 1941 to April 1942)

Members of the SOCIETY should note that these committees are *their* committees. Some of these committees deal with very general and all-important problems. They desire to serve as clearing houses and are anxious to have suggestions and thoughts from individual members. Send your suggestions to the chairman of the committee. There is no committee so able or representative that it cannot profit by the individual ideas of the membership.

Advisory to the Bureau of Mines and National Bureau of Standards on Nonferrous Metals. *A. C. S. Representative on the Committee:* Wm. B. Price, Scoville Mfg. Co., Waterbury, Conn.

Analysis of Commercial Fats and Oils (established 1926). *Chairman*, V. C. Mehlenbacher, 112 South La Grange Road, La Grange, Ill.; J. Fitelson, W. D. Hutchins, M. L. Laing, C. P. Long, K. S. Markley, J. E. Maroney, L. B. Parsons, W. J. Reese, H. A. Schuette, M. L. Sheely, S. O. Sorensen, L. M. Tolman, H. P. Trevithick, F. C. Woekel.

Analytical Reagents (established 1917). *Chairman*, W. D. Collins, U. S. Geological Survey, Washington, D. C.; A. Q. Butler, J. V. Freeman, P. H. Messinger, R. A. Osborn, Joseph Rosin, John F. Ross, Edward Wichers, H. H. Willard.

Annual Report on Atomic Weights (established 1897). G. P. Baxter, Coolidge Memorial Laboratory, Cambridge, Mass.

Award Committees:

American Chemical Society Award in Pure Chemistry (established 1931). Canvassing Committee for Award Nom-

inations: *Chairman, Term Expires April 30, 1942:* Everett S. Wallis. *Term expires April 30, 1943:* George Scatchard. *Term expires April 30, 1944:* Ralph L. Shriner.

Borden Co. Award in Chemistry of Milk (established 1938). Canvassing Committee for Award Nominations: *Chairman, Term expires April 30, 1942:* Leroy S. Palmer. *Term expires April 30, 1943:* R. C. Newton. *Term expires April 30, 1944:* R. Adams Dutcher.

Eli Lilly and Company Award in Biological Chemistry (established 1934). Canvassing Committee for Award Nominations: *Chairman, Term expires April 30, 1942:* Ben H. Nicolet. *Term expires April 30, 1943:* M. L. Crossley. *Term expires April 30, 1944:* Lyndon F. Small.

Chemical Service to Medicine (established 1939). (Committee reports to the Directors.) *Chairman,* Vincent du Vigneaud, Cornell University Medical School, 1300 York Ave., New York, N. Y.; H. T. Clarke, W. G. Karr, V. C. Myers, A. E. Osterberg, D. D. Van Slyke.

Cooperation with Chemical Warfare Service (established 1920). *Chairman,* H. E. Howe, 1155 16th St., N. W., Washington, D. C. *Research:* Roger Adams, Per K. Frolich, C. A. Kraus, A. B. Lamb, E. R. Weidlein, F. C. Whitmore. *Development:* Bradley Dewey, W. K. Lewis, G. A. Richter, C. M. A. Stine, L. T. Sutherland. *Production:* G. O. Curme, Jr., W. H. Dow, L. C. Jones, M. C. Whitaker. *Physiological:* Wm. Mansfield Clark, Paul D. Lamson, E. K. Marshall, Jr., D. D. Van Slyke, Vincent du Vigneaud.

Cooperation with National Defense Research Committee (established 1940). (Committee reports to the Directors.) *Chairman,* Roger Adams, Chemistry Laboratory, University of Illinois, Urbana, Ill.; Harry N. Holmes, Thomas Midgley, Jr., *Ex Officio;* J. B. Conant, W. K. Lewis, Charles L. Parsons, E. R. Weidlein, R. E. Wilson.

Council Policy (established 1923). *Ex Officio: Chairman,* Harry N. Holmes, Severance Chemical Laboratory, Oberlin College, Oberlin, Ohio; Robert T. Baldwin, E. J. Crane, Wm. Lloyd Evans, Per K. Frolich, H. E. Howe, A. B. Lamb, Thomas Midgley, Jr., Charles L. Parsons. *Term expires December 1942:* Erle M. Billings. *Term expires December 1943:* G. J. Esselen. *Term expires December 1944:* Walter A. Schmidt.

Economic Status (established 1941). *Chairman,* Lawrence W. Bass, Mellon Institute, Pittsburgh, Penna.; George Calingaert, Walter A. Schmidt, Walter G. Whitman, F. C. Whitmore.

Exchange (established 1907). *Chairman,* E. J. Crane, *Chemical Abstracts,* Ohio State University, Columbus, Ohio; H. E. Howe, A. B. Lamb.

Hazardous Chemicals and Explosives, to Cooperate with National Fire Protection Association Committee on the same subject (established 1923). *Chairman,* George W. Jones, U. S. Bureau of Mines, Pittsburgh, Penna.; F. F. Chapman, A. H. Nuckolls.

Industrial Alcohol (established 1921). *Chairman,* Martin H. Ittner, Colgate-Palmolive-Peet Co., Jersey City, N. J.; R. F. Bacon, J. H. Beal, J. G. Davidson, W. H. Dow, E. H. Killheffer, R. H. McKee, H. W. Rhodehamel.

Licensing Inquiry (established 1939). *Chairman,* Frederic W. Willard, 12 Hawthorn Place, Summit, N. J.; Arthur Guillaudeu, H. S. Lukens, Foster D. Snell.

Membership (established 1876). *Chairman,* W. D. Collins, U. S. Geological Survey, Washington, D. C.; H. E. Howe, Charles L. Parsons.

National Research Council Representatives from A. C. S. on Division of Chemistry and Chemical Technology. *Terms expire July 1, 1942:* Per K. Frolich, John R. Johnson. *Terms expire July 1, 1943:* G. J. Esselen, Paul M. Gross. *Terms expire July 1, 1944:* L. W. Bass, H. M. Chadwell.

Nomenclature, Spelling, and Pronunciation (established 1894). *Chairman,* E. J. Crane, *Chemical Abstracts,* Ohio State University, Columbus, Ohio; Board of Editors of the *Journal of the American Chemical Society;* Editor of *Industrial and Engineering Chemistry;* L. T. Capell, A. M. Patterson, Janet D. Scott.

Paper (established 1908). *Chairman,* Byron L.Wehmhoff, 6506 Brennon Lane, Chevy Chase, Md.; B. W. Scribner, H. J. Skinner.

Patent and Related Legislation (established 1899). *Chairman,* Walter A. Schmidt, 1016 West Ninth St., Los Angeles, Calif.; Robert T. Baldwin, F. E. Barrows, F. G. Breyer, Bruce K. Brown, Henry Howard, Nelson Littell, J. C. Morrell, O. W. Storey, H. T. Stowell, E. H. Volwiler.

Professional Status (established 1935). *Chairman,* Thomas Midgley, Jr., Worthington, Ohio; Webster N. Jones, Donald B. Keyes, Charles D. Lowry, Jr., William McPherson, H. L. Trumbull.

Professional Training of Chemists (established 1936). *Chairman,* W. Albert Noyes, Jr., Department of Chemistry, University of Rochester. River Campus, Rochester, N. Y. *Secretary* (member ex officio), Erle M. Billings, 343 State St., Rochester, N. Y. *Term expires April 30, 1942:* A. W. Hixson. *Term expires April 30, 1943:* W. G. Young. *Term expires April 30, 1944:* Harry B. Weiser. *Term expires April 30, 1945:* W. Albert Noyes, Jr. *Term expires April 30, 1946:* S. C. Lind.

Soap and Soap Products(established 1935). *Chairman,* F. W. Smither, National Bureau of Standards, Washington, D. C.; R. E. Divine, J. E. Doherty, C. P. Long, E. B. Millard, M. L. Sheely, H. P. Trevithick.

Standard Apparatus (established 1917). *Chairman,* W. D. Collins, U. S. Geological Survey, Washington, D. C.; J. V. Freeman, R. A. Osborn, Lyon Southworth, Edward Wichers, H. H. Willard.

Standard Methods for the Examination of Water and Sewage, to Cooperate with the Committee of the American Public Health Association (established 1920). *Chairman,* Arthur M. Buswell, University of Illinois, Urbana, Ill.; W. D. Collins, C. R. Hoover, F. W. Mohlman, F. G. Straub.

Standardization of Biological Stains (established 1924). *A. C. S. Representative on the Commission:* John T. Scanlan, Eastern Regional Research Laboratory, U. S. Department of Agriculture, Chestnut Hill, Philadelphia, Penna.

Standardized Methods for Vitamin Research (established 1921). *Chairman,* H. C. Sherman, Department of Chemistry, Columbia University, New York, N. Y.; E. A. Doisy, A. D. Emmett, E. V. McCollum, E. M. Nelson.

Study Problem of the Teaching of Chemistry in High Schools (established 1941). *Chairman,* B. S. Hopkins, Chemistry Laboratory, University of Illinois, Urbana, Ill.; H. N. Alyea, H. A. Carpenter, M. V. McGill, A. W. Scott.

Supervision of Chemical Engineering Catalog (established 1915). W. R. Veasey, Dow Chemical Co., Midland, Mich.

Supervisory on Standard Methods of Analysis (established 1910). *Chairman,* H. H. Willard, 208 Chemistry Bldg., University of Michigan, Ann Arbor, Mich.; B. L. Clarke, I. M. Kolthoff, G. E. F. Lundell, W. W. Skinner.

Women's Service (established 1927). *Chairman,* May L. Whitsitt, Department of Chemistry, Southern Methodist University, Dallas, Tex.; Mildred Adams, H. Marjorie Crawford, Rachel H. Edgar, Mildred W. Grafflin, Gertrude Vermillion.

A. C. S. Presidential Data

THE selection of Per K. Frolich as President-Elect of the AMERICAN CHEMICAL SOCIETY for 1943 is significant from three viewpoints.

Dr. Frolich was born in Norway and his election again emphasizes how much of value chemistry in America has obtained from those who have become Americans by choice rather than by birth. Of the 55 men who have been chosen as President of the AMERICAN CHEMICAL SOCIETY 10 were born outside Continental United States. Those who have preceded Dr. Frolich are: John William Draper, 1876, England; Frederick Augustus Genth, 1880, Germany; John William Mallet, 1882, Ireland; Charles Anthony Goessmann, 1887, Germany; William Francis Hillebrand, 1906, Hawaii; Alexander Smith, 1911, Scotland; Leo Hendrik Baekeland, 1924, Belgium; Moses Gomberg, 1931, Russia; Lawrence V. Redman, 1932, Canada. Including these men, at least 35 of our Presidents have had part of their education outside the United States.

Dr. Frolich, born in 1899, will be the youngest President of any in office for more than 30 years. Five others were younger than he when they held the same office: Edgar F. Smith in 1895, 41; Arthur A. Noyes in 1904, 38; Marston T. Bogert in 1907, 39; Willis R. Whitney in 1909, 41; and Wilder D. Bancroft in 1910, 43. The average age of all Presidents while in office is 55.

The five Presidents who immediately preceded Dr. Frolich were all connected with educational institutions when they were in office. It is well that chemists from industry should also be represented, though fortunately there has never been in our SOCIETY any sharp distinction between industry and education. Dr. Frolich has been a teacher. Since 39 of the 55 Presidents have been educators, the selection of Dr. Frolich's successor from the ranks of industry would not be out of order.

HARRISON HALE

UNIVERSITY OF ARKANSAS
FAYETTEVILLE, ARK.

American Solidarity

IN THESE times it has been particularly encouraging to receive from American chemists outside of the United States letters expressing sympathy and solidarity in defense. Two letters have been brought to our especial attention—one from Brazil, assuring us that all chemists in the Americas will cooperate with their government for the defense of democratic principles; and another from Mexico, offering services in investigation and laboratory work entirely without remuneration, with the assurance that the writer and his associates are ready to make any sacrifice to help in the task of preserving the everlasting liberties of the New World.

A. C. S. Student Membership Awards for 1941

DONOR	RECIPIENT
Alembroic Society of Mount Union College. Annual award of one-year's membership in the AMERICAN CHEMICAL SOCIETY to that junior or sophomore chemistry major, who, in the opinion of the faculty and seniors of the Alembroic Society, has accomplished the most outstanding piece of work in chemistry during the previous year.	**William R. Werner**
Brown University. Annual award to the highest standing junior chemist at Brown University. Award consists of one-year's membership dues and a subscription to one of the SOCIETY's journals and was given to Mr. Tamarkin as a result of his standing on June 1, 1941.	**Paul Tamarkin**
Delaware Section, AMERICAN CHEMICAL SOCIETY. This award, consisting of membership and subscriptions to the *Journal of the American Chemical Society* and *Industrial and Engineering Chemistry*, was won by Mr. Rommel as the outstanding senior in chemical engineering at the University of Delaware for the academic year ending in June 1941.	**Richard H. Rommel**
Howard University, Department of Chemistry. This prize, consisting of membership in the AMERICAN CHEMICAL SOCIETY and a subscription to one of the SOCIETY's journals, is given to the senior student majoring in chemistry who has the highest rank in his major requirements.	**Harold Delaney**
Indiana Section, AMERICAN CHEMICAL SOCIETY. This award is made to undergraduate students who have completed three years of study majoring in chemistry or chemical engineering and who have been chosen from among applications for the award made to the heads of chemistry departments of colleges in Indiana as the most worthy for the award. The names submitted by them (one by each head), with supporting data covering the student's scholastic attainments, are sent to the Secretary of the Indiana Section for the selection of two recipients by the Executive Committee of that section.	**Warren J. Close** De Pauw University **Otto Zajicek** Indiana University
Louisiana Section, AMERICAN CHEMICAL SOCIETY. This award, consisting of junior membership in the AMERICAN CHEMICAL SOCIETY and a subscription to one of the SOCIETY's journals, is made each year by the Louisiana Section to the outstanding student in chemistry or chemical engineering at Tulane University.	**Edmund M. Buras, Jr.**
Mu Chapter of Alpha Chi Sigma Fraternity, University of New Hampshire. This is the senior award granted annually to the member of Mu Chapter who exhibits the greatest promise of success in his professional life.	**Peter J. Grabowski**

Silver Aircraft Engine Bearings

SILVER-LINED bearings are being used effectively in aircraft engines of the radial air-cooled type and also in engines designed for liquid cooling, according to information released by the American Silver Producers' Research Project. Some of the bearings are complete rings coated inside and outside with silver and some are split and coated on the inside surface only. Silver is understood to be capable of carrying a higher load than babbitt, to be a better conductor of heat, and to retain its hardness at temperatures above those feasible with babbitt.

Mustard Oil Explosion

THERE are two possibilities which might account for the violent mustard oil explosion reported in the NEWS EDITION for December 10, 1941, page 1408. Alkylrhodanides can under certain conditions hydrolyze into fulminates and hydrosulfides:

$$MCSN + H_2O = CNOH + MHS$$

The catalyst for this reaction is not known.

The second possibility is the production of cyanur chloride by hydrochloric acid (Bergman, "Lehrbuch der organischen Chemie", Vol. 1), which can decompose to nitrogen trichloride and "carbonic nitride" (Franklin, "Nitrogen System of Compounds"):

$$(CClN)_3 = NCl_3 + C_3N_3$$

NEWS-MAKERS

Robert J. Bibbero, who has been connected with the Pacific Manifolding Book Co., Emeryville, Calif., as research engineer, has recently accepted a commission as ensign in the Bureau of Ordnance, U. S. Naval Reserve, Fort Schuyler, the Bronx, New York, N. Y.

Claude F. Davis has been made chief chemist of the Schwarz Laboratories, Inc., 202 East 44th St., New York, N. Y. Mr. Davis was formerly with the Michigan Bakeries, Grand Rapids, Mich.

Martin Eliason has been appointed representative of the Jessop Steel Co. in the Milwaukee territory, with offices at 419 Colby Abbott Bldg., Milwaukee, Wis.

Alan G. Hamilton, until recently manager of solvent sales development for the R. & H. Chemicals Department, E. I. du Pont de Nemours & Co., Inc., Niagara Falls, is now at the El Monte, Calif., plant of the Pacific Division, doing work of a special nature.

Lewis P. Harris, chemist in charge of the Sherwin-Williams Co.'s Insecticides Laboratory at Yakima, Wash., has been transferred to the company's plant at 1450 Sherwin Ave., Oakland, Calif., as production research chemist.

O. H. Huntley is now plant manager of H. McKenna, Inc., a subsidiary of Joseph E. Seagram and Sons, Inc., Fairfield, Nelson County, Ky.

Richard G. Kadesch completed the requirements for the degree of Ph.D. in organic chemistry at the University of Chicago in August 1941 and is now employed as research chemist in organic chemistry at the Columbia Chemical Division of the Pittsburgh Plate Glass Co., Barberton, Ohio.

Norman F. Kruse, for six years technical director of the soybean expeller and extraction plants of the Central Soya Co., Inc., Fort Wayne, Ind., has been appointed general superintendent of all soybean processing and feed-mixing operations of the company and its affiliate, McMillen Feed Mills.

Norman F. Kruse

Pat Macaluso, Edgar W. Goth, Peter A. Pfeiffer, and **Herbert H. Watjen** have been added to the staff of Foster D. Snell, Inc., Brooklyn, N. Y.

Donal F. McCarthy has become a member of the firm of Pennie, Davis, Marvin and Edmonds, 247 Park Ave., New York, N. Y.

James F. McNamara

James F. McNamara, mill products sales manager of the International Nickel Co., was elected a member of the board of directors of the Lukens Steel Co. at its recent meeting of stockholders.

M. G. Mastin, formerly director of process control at Westvaco Chlorine Products, Inc., South Charleston, W. Va., has been transferred to the Market Development Division in New York City. **R. F. Moran,** formerly assistant chief chemist at South Charleston, succeeds Mr. Mastin.

Harold M. Moore, St. Louis representative of Manning, Maxwell & Moore, Inc., has been called for active duty with the commission of a captain, and is located at Camp San Luis, Obispo, Calif., with the 40th Infantry Division, Field Artillery.

David H. Osgood, formerly with the C. W. Hess Co., Detroit, Mich., and active in the Detroit Section of the AMERICAN CHEMICAL SOCIETY, is now serving with the Prices Division, Protective Coating Unit, Office of Price Administration, Washington, D. C.

George P. Passmore has been appointed works manager in charge of manufacturing of the Wellsville Works of the Worthington Pump and Machinery Corp., Harrison, N. J.

C. F. Rassweiler, who joined Johns-Manville Corp., New York, last June as director of research, has been appointed a vice president of the company. Dr. Rassweiler will continue in charge of the company's research and development activities, now largely devoted to converting the full production capacity of Johns-Manville to war uses.

E. L. Reed has been added to the staff of the Foote Mineral Co., Philadelphia, Penna., as project engineer to do research and development work on milling and concentration problems.

G. M. Ridenour, formerly associate professor in sanitary engineering at Pennsylvania State College, has become associate resident lecturer in public health engineering at the School of Public Health, University of Michigan, Ann Arbor, Mich.

H. H. Rowley has been appointed associate professor of physical and analytical chemistry at Lawrence College, Appleton, Wis. For the past five years he has served as associate in physical chemistry at the State University of Iowa, where he was Chairman and Secretary-Treasurer of the Iowa Section of the AMERICAN CHEMICAL SOCIETY.

H. H. Rowley

Julio Cabello Ruz, a Chilean, has received a commission for chemical research from the Comisión Nacional de Cultura, de Buenos Aires, Argentina. He will work at the University of Buenos Aires.

Henry A. Saller has been named research engineer on the technical staff of the Battelle Memorial Institute, Columbus, Ohio, and has been assigned to research in metallurgy. He was formerly with the Carnegie-Illinois Steel Corp.

Rex R. Shively, chief technologist and vice president of B. F. Drakenfeld and Co., Inc., was honored by his alma mater, the Oklahoma Agricultural and Mechanical College, by being made a member of the Hall of Fame on December 15.

Charles H. Stone, whose chemical business and plant at Charlotte, N. C., were acquired in 1937 by American Cyanamid & Chemical Corp., New York, has completed the period of personal services contemplated at the time of acquisition. Mr. Stone will continue his connection with the corporation in an advisory capacity. He will be located in the Commercial Bank Building, Charlotte.

Chaplin Tyler, who was assigned for a year as public relations director of the Remington Arms Co., Bridgeport, Conn., has returned to E. I. du Pont de Nemours & Co., Inc., Wilmington, Del., to join the staff of the Development Department.

Edmund D. Wingfield has been appointed administrative superintendent of the Freeport Sulphur Co., and will be stationed at the company's offices in New Orleans.

W. A. Wirene has been appointed assistant sales manager of the petroleum, chemical, mining, and steel mill section of the General Electric Industrial Department, Schenectady, N. Y.

Appointments to National Panel of Arbitrators

THREE men in the chemical field, all members of the AMERICAN CHEMICAL SOCIETY, have been appointed to serve as impartial arbitrators in connection with any industrial or commercial disputes involving vital war material production: Benjamin H. McGar, chief chemist and assistant research director, Chase Brass & Copper Co., Waterbury, Conn.; Kenneth B. Lacy, president, Lighting Products, Inc., Highland Park, Ill.; and Edward Thomas, patent attorney of New York and Washington, D. C.

The new appointees join a Nation-wide panel of more than 8,000 qualified and carefully selected professional, educational, and business leaders in approximately 1,600 cities in every state in the Nation. A substantial number are men of the chemical profession.

The Arbitration Association, a non-profit organization, which completed its 50th year of successful operation last month, has announced that its 31 regional offices, with hearing rooms and personnel facilities, are available for the duration of the war for any type of commercial or labor-management dispute which might directly or indirectly retard all-out war effort in all industries and professions.

Teaching Fellowships at Northeastern University

SEVERAL teaching fellowships in chemistry for 1942–43 are available for well-qualified graduate students interested in pursuing work in chemistry for the degree of master of science at Northeastern University.

Candidates must have majored in chemistry or chemical engineering in their undergraduate work and must have an academic record and personal qualifications which indicate their ability to profit from graduate study.

The program for the master of science degree will normally be spread over a two-year period, since each teaching fellow will be expected to devote approximately half of his time each year to instructional work. This will consist of the correction of papers, assistance in the laboratories, section work, and similar duties.

Teaching fellows will receive a stipend of $700 during their first year of service and $800 for their second year. They will be expected to pay the regular matriculation fee of $5 and a graduation fee of $10, but will be exempted from all tuition charges and laboratory fees. The college year at Northeastern begins on Tuesday following Labor Day and ends about the middle of June.

Applications must be accompanied by a transcript of undergraduate record, letters of recommendation from four persons familiar with the qualifications of the candidate, and a small snapshot or photograph. All applications should be received not later than March 1. Appointments will be made early in April, and all candidates will be notified promptly of the status of their application.

For application forms and further information address the Director of Graduate Study, Northeastern University, Boston, Mass.

Cenco Fellowships Announced

SENIOR college students majoring in physics with minors in chemistry or mathematics are invited to apply for the Cenco industrial fellowships. Two, and possibly three, fellows will be appointed in April. Tenure will be July 1, 1942, to June 30, 1943. The stipend is to be $1,200. Fellows, although under supervision of the director of research and development, will be given experience in other departments of the company. Application blanks may be secured from M. N. States, Central Scientific Co., 1700 Irving Park Road, Chicago, Ill.

Elmer Peter Kohler Memorial Fellowship

AS A MEMORIAL to E. P. Kohler, professor of chemistry at Bryn Mawr College until 1912 and Sheldon Emery Professor of Organic Chemistry at Harvard University at the time of his death in May 1938, a fellowship for graduate study in chemistry has been endowed through contributions of his students and friends. Since the special purpose of the fellowship is to perpetuate the memory of a man distinguished by his eminence as a scientist and beloved as a teacher of rare qualities who exerted a profound and wide-spread influence on the progress of instruction in chemistry throughout the country, recipients of the fellowship will be chosen in such a way as to provide for an exchange of outstanding students between the institutions where Kohler taught and those in which the Kohler tradition is particularly cherished.

Although the income from the fund now at hand would permit the awarding of the fellowship for the coming academic year, it has seemed unwise to make the initial award in the present unsettled period. At some future date, when there is greater prospect of utilizing the award in a fully effective way and of promoting the work of the very best type of student, announcement will be made of detailed plans for the award.

J. T. Baker Chemical Co. Analytical Research Fellowships

ANNOUNCEMENTS of the J. T. Baker Chemical Co. Research Fellowships in Analytical Chemistry for the academic year 1942–43 have recently been made through brochures widely distributed to colleges and universities. Two of these fellowships are to be granted and each carries a stipend of $1,000. One is awarded to a graduate student in analytical chemistry attending an eastern university and the other to a graduate student at a midwestern university. Applications should be made before February 15, 1942, to John H. Yoe, University of Virginia, University, Va., for the eastern fellowship, and to H. H. Willard, University of Michigan, Ann Arbor, for the midwestern fellowship.

Highly important to the user of refractories is the kind of research which leads to the improvement of existing types of refractory products, no less than to development of new ones to meet the ever-increasing severity of the demands that metallurgical progress entails. Latest extension to Harbison-Walker's research laboratory at Pittsburgh, Penna., includes installation of a complete pilot plant covering manufacture of brick by any one of the various processes now in use. It is one of the most modern and fully equipped laboratories for advanced refractories research.

American Chemical Society

103RD MEETING. Memphis, Tenn., April 20 to 24, 1942.

104TH MEETING. Buffalo, N. Y., September 7 to 11, 1942.

105TH MEETING. Indianapolis, Ind., spring of 1943.

106TH MEETING. Minneapolis, Minn., fall of 1943.

NINETEENTH NATIONAL COLLOID SYMPOSIUM, Division of Colloid Chemistry. University of Colorado, Boulder, Colo., June 18 to 20, 1942.

Other Scientific Societies

AMERICAN ASSOCIATION OF CEREAL CHEMISTS. Edgewater Beach Hotel, Chicago, Ill., May 18 to 22. Annual meeting.

AMERICAN CERAMIC SOCIETY. Hotel Netherland Plaza, Cincinnati, Ohio, week of April 19. Annual meeting.

AMERICAN INSTITUTE OF CHEMICAL ENGINEERS. Boston, Mass., May 11 to 13. Semiannual meeting.

AMERICAN INSTITUTE OF NUTRITION. Boston, Mass., April 1 and 2.

AMERICAN PHYSICAL SOCIETY. Detroit, Mich., February 20 and 21.

AMERICAN SOCIETY FOR TESTING MATERIALS. Atlantic City, N. J., June 22 to 26.

AMERICAN SOCIETY OF BIOLOGICAL CHEMISTS. Copley-Plaza, Boston, Mass., March 31 to April 4.

ELECTROCHEMICAL SOCIETY. The Hermitage Hotel, Nashville, Tenn., April 15 to 18.

INSTITUTE OF FOOD TECHNOLOGISTS. Minneapolis, Minn., June 15 to 17.

NATIONAL CHEMICAL EXPOSITION. Stevens Hotel, Chicago, Ill., November 17 to 22.

NATIONAL PETROLEUM ASSOCIATION. Hotel Cleveland, Cleveland, Ohio, April 16 and 17. 39th semiannual meeting.

SCIENTIFIC APPARATUS MAKERS OF AMERICA. Hotel Hershey, Hershey, Penna., June 1 to 3.

SIXTH PHARMACEUTICAL INSTITUTE. Center for Continuation Study, University of Minnesota, Minneapolis, Minn., February 16 to 18.

TECHNICAL ASSOCIATION OF PULP AND PAPER INDUSTRY. Commodore Hotel, New York, N. Y., February 16 to 19.

National Symposium on Spectrographic Analysis Dallas Meeting, A. A. A. S.

On Tuesday, December 30, 1941, at the Christmas meeting of the American Association for the Advancement of Science, a National Symposium on Spectrographic Analysis was featured—the first ever held west of the Mississippi. The program was arranged by invitation by William M. Craig, of Texas Technological College. Included on the program were the outstanding authorities of the Nation in many different branches of spectrography. The keynote of the symposium was problems of control of the metallic content of materials vitally needed in carrying out the national defense program.

Dr. Craig opened the symposium with a discussion of applications of spectrography to problems of defense and everyday life, including detection of adulteration in foods, textiles, various metallic alloys, and other products. He also demonstrated a new method which he proposed for correlation of strata in oil wells by a spectrographic analysis of oil-well cuttings.

Ralph A. Sawyer, University of Michigan, gave a rather detailed description of the recent spectrographic installations at the Ford River Rouge plant and the Bethlehem Steel Co. He showed how an analysis of steel may be made within a period of three minutes, whereas hours were required previously. Because of the cheapness, accuracy, and speed of the new method, many more analyses are made than formerly, and much closer control is attained.

O. S. Duffendack, also of the University of Michigan, a well-known authority on the analysis of alkalies and heavy chemicals, gave an account of recent research on electrical sources of arcs and sparks used in making spectrographic determinations. He showed how greater accuracy and speed of quantitative analyses were thus possible.

Methods used in the adequate control of the purity of magnesium and its alloys were described by J. L. Saunderson, chief spectrographer of the Dow Chemical Co., the largest manufacturer of magnesium in the world. Magnesium is of immense value in making light-weight alloys for aircraft and has many other war applications, including incendiary bombs. This company has recently installed two large magnesium plants on the Texas coast.

Recent advances in research on the spectrographic analysis of nonmetallic substances were cited by Maurice F. Hasler, of the Applied Research Laboratories, Los Angeles. He described a new and vastly improved grating spectrograph, which uses a short length of motion picture film instead of the usual fragile glass plates. Phase rule studies of spectrographic analyses made with such materials as glasses, clays, and other insoluble and refractory materials were discussed. These promise to have great value in the ceramic, food, and textile industries.

John A. Hipple, Jr., Westinghouse Research Laboratories, Pittsburgh, described the latest developments in research with the mass spectrometer. His work has brought out a new design, much less bulky and more rapid and accurate than the instruments formerly used. He has recently perfected its application in the quantitative analysis of gas mixtures.

Henry R. Kreider, American Medical Association of Chicago, in a paper on infrared absorption, discussed recent advances in this field. This part of the spectrum has been utilized lately for the identification of hydrocarbons in petroleum products and in oil prospecting. Applications to prevent cancer growth were also discussed. Infrared rays are the very long, invisible heat rays used for baking enamel on automobiles.

Two of the leading young astronomers of the country, C. T. Elvey, assistant director of the MacDonald Observatory, Fort Davis, Tex., and Franklin E. Roach, Steward Observatory, Tucson, Ariz., gave interesting papers on "The Spectrum of the Night Sky" and "The Chemical Analysis of the Stars", respectively. The operation of the world's most rapid lenses was explained by Dr. Elvey.

Although astronomy may seem a far cry from defense problems, such is not the case. The carefully perfected methods developed in spectrographic research by astronomers may be used equally well in the determination of metallic impurities in common alloys used in making war material. To Dr. Roach goes credit for laying the foundation for the method which is so effective in the rapid present-day quantitative analysis of steel.

Marshall N. States, director of research and development for Central Scientific Co., Chicago, explained the important characteristics of the photoelectric spectrophotometer. He also cited its many important uses in the chemical analyses which would otherwise prove very difficult, as well as its application in the quantitative determination of the vitamin content of foods—a factor so important in our national health, for both our soldier and civilian population.

The symposium was well received, as evidenced by capacity crowds, and standing room was frequently at a premium. F. R. Moulton has arranged through the A. A. A. S. to underwrite the printing of a monograph from the papers presented at the symposium. J. L. Saunderson, Dow Chemical Co., was chosen by the authors to receive the manuscripts and prepare the material for early publication.

Pay-Roll Allotment for Defense Bonds in Chemical Industry

The chemical industry is being organized for the pay-roll allotment plan of the defense savings bond campaign. The general campaign for Greater New York is under the chairmanship of Lewis E. Douglas, Mutual Life Insurance Co.; the Industry Committee is under the chairmanship of J. E. Crane, Standard Oil Co. of New Jersey; and the chemical industry is under the chairmanship of P. M. Dinkins, American Cyanamid & Chemical Corp. The chemical industry's committee consists of: J. J. Butler, West Virginia Pulp & Paper Co.; Earl Demmon, Stauffer Chemical Co.; Fred Koch, Dow Chemical Co.; C. L. Gabriel, Commercial Solvents Corp.; W. I. Calliher, Pittsburgh Plate Glass Co.; Lester Gordon, Solvay Sales Co.; George Handel, Cincinnati Chemical Works; Glenn Haskell, U. S. Industrial Chemicals, Inc.; J. H. Karrh, Victor Chemical Works; R. J. Quinn, Mathieson Alkali Works; J. P. Remensnyder, Heyden Chemical Co.; Ira Vandewater, R. W. Greeff & Co., Inc.; W. J. Weed, Niagara Alkali Co.; and V. E. Williams, Monsanto Chemical Co.

Graver Prize Contest

Visitors to the exhibit of the Graver Tank & Mfg. Co., Inc., at the Exposition of Chemical Industries in New York, were given an opportunity to test their skill in a novel contest.

On display in the Graver booth was a cylindrical glass container, divided into six compartments, each containing a chemical used in water conditioning. A prize of $50 was offered to the first person to come closest to estimating the individual weights of the chemicals and their combined weight.

L. R. Moffatt, chemist for Canada Dry Ginger Ale, Inc., of New York City, won the prize, estimating the total weight correctly—and coming close in his estimate of the individual weights.

Terms for Expressing Low Concentrations

The term "milligrams per cent", used in the sense of "milligrams per 100 grams", has found its way into the chemical literature, particularly in biochemical determinations. It is believed that its use should not be encouraged For most purposes the well-known expression "parts per million" is probably adequate for expressing these low concentrations.

A. A. A. S.—Gibson Island Conferences

NEIL E. GORDON, Director; JOHN C. KRANTZ, JR., Assistant Director

THIS is the fifth summer that special research conferences on chemistry and its allied fields have been held at Gibson Island under auspices of the American Association for the Advancement of Science. During this five-year period they have grown from two weeks in the summer of 1938 to ten weeks in 1942. Because of this growth the association has purchased a property, and the conferences are now placed on a permanent basis.

These Gibson Island conferences owe their excellence and popularity to careful planning of the programs by experts, choice of the invited contributors, freedom with which contributors make excursions along and sometimes beyond the frontiers of the known, opportunities for abundant discussion, limitation of participants to 60, mingling of chemists from industrial and university laboratories, and delightful surroundings. At its business meeting each conference determines the subject of the corresponding conference for the following year and nominates its chairman and vice chairman, who are formally appointed by the association.

Conferences for this summer are scheduled for the weeks of June 15 through August 24, excluding the week of August 10.

A. Frontiers in Petroleum Chemistry

Gibson Island is situated in Chesapeake Bay about 20 miles south of Baltimore. It is approximately 1,000 acres in area and is connected with the mainland by a causeway. Admission to this privately controlled island is by card only from the Gibson Island Club sent by the director at the time of registration. In addition to the club and property purchased by the association, there are about 80 private residences on the island, leaving most of it quite uninhabited and covered by forests. The island offers opportunity for golf, tennis, both salt and fresh water bathing, fishing, and sailing.

The conference property consists of a large residence and auxiliary buildings on a wooded 3.6-acre lot situated on the highest hill on the island. The property provides accommodations for about 50 men in addition to a conference room. Others attending the conferences, including those who are accompanied by their wives or families, live at the club or in special cottages. All meals are taken at the club.

Substantial gifts by industrial companies whose laboratories have been represented at the Gibson Island conferences have enabled the association to purchase the property. Each contributing company has the right to have a representative at each conference. This is a substantial right because there have been many more applicants for admission to the conferences than can be accommodated unless the limit of 60 that has been set is exceeded. The participants have felt that to enlarge the conferences would take from them something of the informality and intimate contacts that make them most valuable. Companies that have made the purchase of this property possible are:

Atlantic Coast Fisheries Co., New York
The Barrett Co., New York
The Bell Telephone Laboratories, New York
Davison Chemical Corp., Baltimore, Md.
Distillation Products, Inc., Rochester, N. Y.
Ethyl Gasoline Corp., New York
Gelatin Products Co., Detroit, Mich.
General Electric Co., Schenectady, N. Y.
B. F. Goodrich Co., Akron, Ohio
Hercules Powder Co., Inc., Wilmington, Del.
Leeds & Northrup, Philadelphia, Penna.
Merck & Co., Inc., Rahway, N. J.
Monsanto Chemical Co., St. Louis, Mo.
Norton Co., Worcester, Mass.
Pittsburgh Plate Glass Co., Barberton, Ohio
Research Corp., New York
Standard Brands, Inc., New York
Standard Oil Co. of California, San Francisco
Standard Oil Development Co., Elizabeth, N. J.
The Texas Co., New York

Since the conferences have now been provided a permanent home, a Policy Committee has been set up so that the whole project may be guided with the maximum wisdom. This committee consists of the director of the conferences and the chairman and vice chairman of each conference representing the association and a representative appointed by each of the contributing companies.

The first meeting of the Policy Committee was held September 9 at Atlantic City during the meeting of the AMERICAN CHEMICAL SOCIETY. The committee expressed considerable dissatisfaction of one custom in use, i. e., in having the order of the applications determine the order of selection. This procedure has resulted in having many representatives from a few institutions, and possibly not any from other institutions. To distribute the at-

tendance among a wider number of institutions and bring about a more just representation, it was voted that the programs be published in CHEMICAL AND ENGINEERING NEWS and *Science* and that those interested in attending one or more of the conferences be instructed to send their requests for attendance to the director on or before March 10. Each applicant must state the institution with which he is connected and the type of work in which he is most interested.

The director will submit the names of those making requests to the respective chairmen. The program committee will go over the names in an effort to distribute the requests as fairly as possible among the various institutions from which they have been made. Names selected by the committees will be returned by the chairmen to the director who will notify the selectees, and at that time each who is to attend will be requested to register by mail. On receipt of the registration fee of $3.00, made payable to Section C, A. A. A. S., a registration card will be sent covering admission to the island and use of all guest privileges, including a room reservation. Rooms are $2.00 per day per person and board is à la carte (approximate prices—$0.50, breakfast; $0.75, lunch; $1.25, dinner). War conditions make everything uncertain, so it is ruled that all registration fees will be returned and reservations cancelled provided notice of inability to attend is received at least 10 days before the conference.

Accommodations are available at the club for a limited number of women who wish to accompany their husbands. Also, plans are being worked out by a committee for any man wishing to bring his family. All these requests should be made at the time of the request for attendance, for these particular limited accommodations will be assigned in the order received.

All requests for attendance or any additional information should be addressed on or before March 10 to the director of the conferences, Neil E. Gordon, Central College, Fayette, Mo.

Blackout Costume

WORKERS in factories and pedestrians in traffic can be made visible during blackouts by fluorescent-dyed clothing and ultraviolet lighting, a safety measure demonstrated recently at the Calco Chemical Division of American Cyanamid Co., Bound Brook, N. J. Clothing dyed with fluorescent colors glows in invisible ultraviolet light—permissible in blackouts—with a subdued radiance bright enough to be seen nearby but too weak to be visible at a distance, even in a blackout otherwise complete.

In blacked-out plants equipped with ultraviolet lamps, workers wearing garments made fluorescent by dyeing are readily visible to their associates.

Traffic control during blackouts can be effected by using ultraviolet lamps in traffic lights and in the headlights of vehicles. In the invisible radiance from these lamps, clothing dyed with fluorescent colors glows brightly enough to make persons wearing it visible to drivers or other pedestrians but not to aviators at a distance.

Blackout costume with dress, shoes, and stockings treated with fluorescent dye.

Dyes of many shades, possessing fluorescent properties, are available for application to various textile fibers and fabrics. In ultraviolet light, they give fluorescent colors varying from violet through blues, greens, yellows, oranges, and browns to rich reds.

The technique now suggested to give visibility during blackouts is successfully applied to luminous carpets to guide patrons down the aisles of darkened theaters. Fluorescent garments on players have also been used to produce weird effects in theatrical productions. In England direction markers to air raid shelters and many other things that must be seen even during blackouts are similarly treated.

BRITISH plants engaged in recovering benzene have been instructed to maintain production capacity at a maximum, it is reported from that country, based on a directive dated October 24, 1941.

NORWAY will continue as a source of nitrogenous fertilizers, sulfur, and pyrites for Sweden during 1942, a trade agreement between the two countries indicates.

Uses of Sintered Silver Increasing

ACCORDING to information supplied by Handy & Harman, now directing the American Silver Producers' Research Project, the use of silver in powdered metallurgy is increasing. It is employed for making mechanical mixtures containing metals, such as nickel, which do not alloy with silver except in small proportions. Graphite, tantalum, molybdenum, and tungsten are among the materials mixed in finely powdered form with silver powder, compressed, and sintered at a temperature slightly below the melting point of silver.

Some resulting products can be rolled into sheets or drawn into rods which are used, at present, chiefly for making electrical contacts and welding electrodes, though other applications are contemplated. Even wire suitable for heading operations is produced, since silver itself is ductile and helps to form ductile mixtures. It is possible to make mixtures almost as dense as might be expected if complete alloying were possible. On the other hand, if an ingredient is added which can be volatilized after pressing has been done, a uniformly porous product can be produced.

Camphor May Be Obtained from Kenya, Seychelles, Russia

PARALLEL research into possibilities of obtaining camphor at a reasonable price from ocimum plants in Kenya the Seychelles, and in Soviet Russia is reported in trade studies received in this country from its observers abroad.

The investigation in Kenya reveals that the plant *Ocimum kilimandscharicum* is worth consideration. It is further indicated that the product could find a ready market in the United Kingdom, if economically produced.

Work in the Soviet has revolved around the kindred *Ocimum canum* which grows readily in the Ukraine, Crimea, and Caucasus, and can be acclimated even further north. This plant is said to give an average camphor yield of 20 kg. per hectare.

Construction of Soda Ash Plant in China Delayed

DELAY in receipt of imported machinery has held up construction of a large soda ash plant in China, official sources report, with the information that caustic soda and bleaching powder are being produced by electrolysis.

Figures from American sources in the country show production by private plants in the unoccupied sections of the country amounted to 518 tons for the first half of 1940 and 954 tons in the same period of 1941. Production the second half of 1940 was 765 tons. Production of bleaching powder for 1940 was 137 tons.

NECROLOGY

Clifford Dyer Holley

CLIFFORD DYER HOLLEY, head of the Sherwin-Williams research laboratories, died January 16 after being in poor health for a year.

Dr. Holley was born at Farmington, Maine, September 2, 1878, was graduated from the University of Maine, and the Industrial Chemical Institute of Milwaukee, and received his Ph.D. degree at the Univeristy of Michigan. He was chemist for the Dr. Hand Condensed Milk Co., the Provinsic Chemical Co., and the Maine Experimental Station. Later he served as professor of industrial chemistry at the North Dakota Agricultural College, as superintendent of Lead Products Co., and chemical engineer at the Gould Storage Battery Co. In 1907 he became chief chemist of the Acme White Lead and Color Works, as well as professor of chemical engineering at the University of Michigan. In 1935 he was appointed director of research of the Sherwin-Williams Co.

Dr. Holley was the author of "Analysis of Paint and Varnish Products" and "Paint Vehicles, Japans, and Varnishes", as well as a considerable number of scientific articles. He was a member of the AMERICAN CHEMICAL SOCIETY, the American Society for Testing Materials, the Federation of Paint and Varnish Production Clubs, and Alpha Chi Sigma. He was an outstanding contributor to the progress of research on paints and a steadfast advocate of continuous testing of paint by coordinating accelerated testing with weather exposure on test fences.

William Preston Fitzgerald

WILLIAM PRESTON FITZGERALD, vice president of the J. T. Baker Chemical Co., died January 20 at his home in Easton, Penna. He was 63 years old.

A graduate of Lafayette College in the class of 1902, he had been interested in chemistry all his life. His connection with the Baker Chemical Co. dates back to its organization in 1904.

Mr. Fitzgerald's understanding and tireless efforts contributed largely to the status of Baker analyzed C. P. chemicals, and many of his methods of purification on a production basis are still in use.

Mr. Fitzgerald possessed the ability to serve, not only in a technical capacity, but also as an executive. He made rapid steps forward in the affairs of the company, assuming the post of chief chemist in 1905, becoming a member of the board of directors in 1907, secretary in 1923, and in 1926 vice president.

He was for several years a member of the AMERICAN CHEMICAL SOCIETY.

Harry W. Foote

HARRY W. FOOTE, a member of the faculty of Yale University for 42 years, died January 14 after a brief illness. He was 66 years old.

Dr. Foote was born in Guilford, Conn., received the Ph.B and Ph.D. degrees from Yale University, and subsequently studied at Leipzig and Munich. He became an instructor in chemistry in the Sheffield Scientific School of Yale University in 1898, was made assistant professor in 1904 and professor of physical chemistry in 1912.

He specialized in inorganic and physical chemistry and mineralogy and had been associate editor of the *American Journal of Science*. He had been a member of the AMERICAN CHEMICAL SOCIETY since 1908, and had served as local section chairman. He was a fellow of the Royal Geographical Society, and a member of the Connecticut Academy of Science. His hobby was bee-keeping.

Raymond Freas

RAYMOND FREAS, associate professor of organic chemistry, Tulane University, died January 10 at the age of 56.

Dr. Freas was born at York, Penna., January 23, 1886, and received the B.A. degree from Wittenberg College in 1906. He took graduate work at the University of Pennsylvania in 1907–08 and in 1917 received the Ph.D. degree from Johns Hopkins University.

In 1907–08 he was instructor in chemistry at the Pennsylvania State College, and from 1910 to 1916 was chemist and bacteriologist for the Baltimore City Health Department. He was adjunct professor of chemistry at the University of Virginia in 1917–18, assistant professor of chemistry at Tulane University in 1919–20, associate professor of organic chemisty at the Louisiana State University from 1922 to 1930, and associate professor of organic chemistry at Tulane from 1930 until the time of his death.

Dr. Freas served as Chairman of the Louisiana Section of the AMERICAN CHEMICAL SOCIETY for two terms in 1938 and 1939, and for some years had been a member of the Executive Committee. His specialty was organic chemistry, and he had devoted considerable time to research on electrolytic reduction of organic compounds, preparation of sulfonphthalein dyes, influence of ultraviolet radiation on organic reactions, use of ultra-short radio radiations on organic reactions, and chlorine in water purification.

Library Dedicated to American Scientists

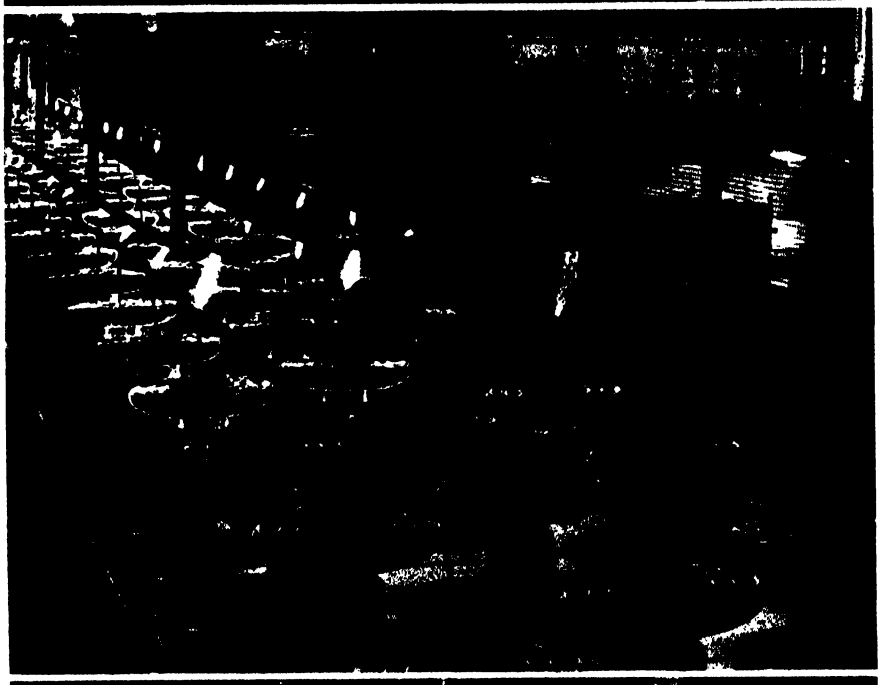
DEDICATION of the Hooker Scientific Library to American scientists was announced by the Friends of the Hooker Scientific Library in the January issue of their official organ, *Record of Chemical Progress*. The dedication is in fulfillment of Dr. Hooker's desire, but was not publicly announced until the library was able to establish a comprehensive plan of technical literature services.

As another step toward making these services universally available, a revised schedule of corporation and institutional membership fees was also announced.

Full information about the library as a nonprofit service institution may be obtained from the Hooker Scientific Library, Central College, Fayette, Mo.

Missouri Offers Research and Graduate Fellowships

THE Missouri School of Mines and Metallurgy and the State Mining Experiment Station, in cooperation with the U. S. Bureau of Mines, offer several graduate fellowships in mining, metallurgy, or chemistry. The remuneration for each fellowship is $800 per year for 11 months' work, beginning August 1, 1942. Fellows pay fees amounting to $72 per school year.



Fellows who have master of science degrees may become candidates for the doctor of philosophy degree. Those who have bachelors' degrees register for the masters' and, until it is earned, are not considered candidates for the Ph.D. Work in the Bureau of Mines constitutes the basis for the thesis. Fellows observe bureau rather than college vacation periods.

Some graduate assistantships in geology, ceramic engineering, chemical engineering, and physics also are open. They carry a stipend of $600 for the school year and require about half-time teaching duties.

Applications, with a certified transcript of college record, a statement of professional experience, photograph, and three letters of recommendation, will be received up to March 15, and should be addressed to Dean Curtis L. Wilson, Missouri School of Mines and Metallurgy, Rolla, Mo.

New Ceramic Saves Defense Materials

PROBABLY the very best indication of the adaptability of porcelain to the changing needs of industry is the introduction, during a hectic year, of a wholly new process and plastic product. This material, "Prestite", was developed by Westinghouse Electric & Manufacturing Co. as an answer in the race to release badly needed defense materials. In this case the substitute in a number of instances out-performs the materials it displaces. Two months after announcement, the new development was being produced in volume and a few months later temporarily outstripped available manufacturing capacity. Although Prestite is properly termed a new plastic because it is formed accurately to intricate shapes, it is actually a porcelain since it is made from exactly the same ingredients and is fired in the same kiln with it. Mechanically the plastic is as strong in compressions as wet-process porcelain. It retains its mechanical strength without deformation or warpage at temperatures that would completely destroy phenolic plastics. Electrically the material is the equivalent of wet process porcelain. It has the same dielectric strength, is completely impervious to moisture, may be subjected to repetitive flashover without surface charring, and otherwise behaves like the highest grade electrical porcelain.

Recently the newly created Prestite has substituted for aluminum in the storage reservoir of water coolers. In that application, ease of forming, dimensional fidelity, and high mechanical strength were essential characteristics. Because porcelain is completely inert chemically, it has proved to be even more suitable than the previous metal reservoir.

Distribution transformer tap changer plates have always been made of wet-process porcelain because of the requirement for high dielectric strength. The economic and mechanical limitations in the production of these plates have always made a design compromise necessary. Normally, long leakage distance and close dimensional tolerances were prime requisites. Cast or pressed plastic bodies would not permit either, so designs were accommodated to the deficiencies in the manufacturing processes. Leakage distances were as long as possible but seldom adequate. Warpage caused a high

India Studies Utilization of Surplus Molasses

RESEARCH activities are reported in India on recovering useful chemicals from the surplus molasses accumulated by the local sugar industry, according to the U. S. Department of Commerce.

This surplus is estimated at approximately 500,000 tons annually. Research schemes under the auspices of the Board of Scientific and Industrial Research relate to extraction of potassium salts from molasses and recovery of certain organic acids and alcohols. Arising from these investigations, a collection of national type cultures for various fermentation products has been organized at Bangalore.

Dried Blood Shipments from Argentina Gain

ARGENTINE exporters are increasing their shipments of dried blood, 1940 exports of 10,713 metric tons having increased to 13,522 metric tons in the first 10 months of 1941, according to official export figures of the country.

Since exports approximate production, the figures indicate output of this commodity. Shipments are made by both packing houses and independent exporters.

Above. **Testing insulators at full A. I. E. E. 60-cycle flashover.** ***Below.*** **Prestite can be pressed accurately to intricate shapes.**

percentage of rejections and a distressing waste of time in assembly. The newly developed Prestite plates, on the other hand, provide adequate leakage paths and are free from warpage. Dimensional tolerances less than half those required for wet-process porcelain are every day saving valuable hours on transformer assembly lines.

Certain vital parts of ignition systems can be completely freed from the exasperating deterioration caused by repetitive flashover or warpage brought about by high operating temperatures through the use of the new plastic. No other known plastic can hope to accomplish both of those results.

Enclosed fused cutout housings are notoriously susceptible to warpage and dimensional inaccuracies at the time they are formed. They have always been cast and such inaccuracies are inherent in that process. In order to minimize those defects and because of dielectric strength requirements, thick sections have been tolerated. Such Prestite accessories on distribution systems are marvels of dimensional accuracy. Doors fit, weight is down, and appearance improved.

Pump valve seats have been a source of trouble. Prestite has displaced all other materials in some instances and improved the life as well as the serviceability of the valves in which it is being used.

Fats, Oils, and Oil-Bearing Materials in the United States. 51 pages. U. S. Tariff Commission, Washington, D. C., 1941. Free of charge, limited supply.

WAR between the United States and the Axis powers, general dislocation of world trade, and increased need for certain fats and oils both to meet the country's own requirements and to supply aid under its Lend-Lease commitments have caused the U. S. Tariff Commission to issue a report giving statistical data on the consumption, uses, and foreign trade in fats, oils, and oil-bearing materials commercially important in the United States.

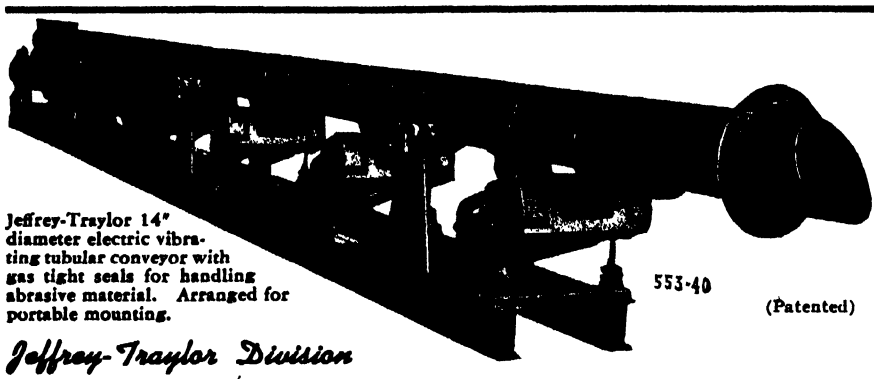
In 1940 total consumption of fats and oils amounted to 9,800,000,000 pounds, of which 67 per cent entered into food products, 20 per cent into soap, 8 per cent into paints, varnishes, etc., and 5 per cent into miscellaneous products. Domestic fats and oils accounted for about 85 per cent of the total consumption.

The United States has long been on a net import basis with respect to fats and oils entering each of the four broad classes of consumption mentioned above, except edible products. Principal imports have always been vegetable oils and the nuts and seeds from which these are obtained. In 1940, 12 vegetable oils of foreign derivation accounted for about 95 per cent of the total quantity of United States imports of fats, oils, and oil-bearing materials. Six of these oils—coconut, palm, olive, babassu nut, palm kernel, and cottonseed—are used principally in the manufacture of edible products or soap. Of this group much the greater part came from the Philippines and the Netherlands Indies, trade which is now disrupted. The other six imported oils are used in paints, varnishes, and for other technical purposes. Western Hemisphere countries have been the dominant suppliers, Latin America furnishing the bulk of the two most important oils in the group, linseed and castor, and also supplying all of the oiticica oil. Tung oil, however, came almost exclusively from China, and perilla and rapeseed oils from Japan and Japanese-dominated areas of China.

Stocks of fats and oils at the end of September 1941 amounted to less than 2,700,000,000 pounds, compared with 3,300,000,000 at the end of 1940.

Prices of fats and oils rose sharply during 1941. By the middle of the year the average prices of many, including butter, reached levels higher than in any preceding year in a decade.

Industrial Instruments for Measurement and Control. *Thomas J. Rhodes.* 1st ed., 573 pages. McGraw-Hill Book Co., Inc., 330 West 42nd St., New York, N. Y., 1941. Price, $6.00.



IN THE preface Mr. Rhodes states that his intention was to create a textbook for the study of instruments and automatic control in engineering schools and a reference book for those concerned with instrument and control problems in industry.

Rhodes has done a good job in following his original intention and the present offering fulfills, capably, a long-felt need of the instrumentation engineer.

No attempt was made to describe all available commercial types of controls and instruments. This was a wise decision in view of their number. Each major control device, however, has a chapter on its chief type, construction, use, and theory. Where possible, Rhodes has backed up verbal discussions of theory with the best available mathematical explanations. One severe criticism must be made of the mathematical treatment especially in the chapter on Automatic Control Theory. This has been made unnecessarily difficult by the lack of standardization of symbols, for the author uses the original nomenclature as found in the reference articles. The net result is most confusing to anyone comparing the investigations. Obviously the symbols should have been standardized for the whole text or at least for each individual chapter. It is disconcerting to find, in the same chapter, many different symbols for the same variable, or many variables having the same symbol. This shortcoming will not encourage interest in this comparatively new mathematical approach to control problems, which is doubly mourned as it is one of the outstanding untouched fields of mathematical-engineering investigation.

There are eleven chapters covering standards: Pressure and Vacuum Gauges; Indicating and Recording Thermometers; High-Temperature Pyrometry; Theory of Differential-Pressure Flowmeter Primary Measuring Instruments; Differential-Pressure Flowmeter Secondary Measuring, Recording, and Integrating Elements; Liquid-Level Measurement; Telemetering; Automatic-Control Theory; Automatic-Control Mechanisms; Miscellaneous Industrial Instruments.

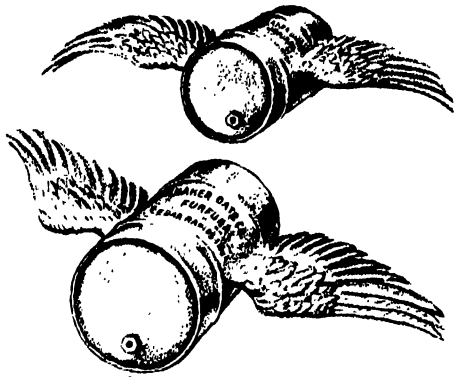
Jeffrey-Traylor 14" diameter electric vibrating tubular conveyor with gas tight seals for handling abrasive material. Arranged for portable mounting.

(Patented)

Jeffrey-Traylor Division



THE JEFFREY MANUFACTURING CO.
885-99 North Fourth Street Columbus, Ohio

SHOOT the Hot Stuff To This Conveyor

No, it's not a cannon but it is a powerful conveying agent for hot, gaseous materials found in chemical plants. A Jeffrey-Traylor electric vibrating conveyor for handling material without dust loss or degradation—30" down to 200 mesh. Tubular or pan types in various diameters and any length. Also electric vibrating feeders, dryers, coolers and screens. Write for engineering data NOW.

QUAKER FURFURAL

AN EFFICIENT SOLVENT

IN petroleum refining, rosin decolorizing, and purification of other crudes, unique selective solvent properties of Furfural permit separation of closely related substance from complex mixtures. Additional general solvent uses not involving selective effects, are based on its ability to carry solutes into porous materials.

Many coating ingredients such as nitrocellulose, cellulose acetate and China wood oil are soluble in Furfural, and it is the best solvent for the heat reactive phenolic resin used in abrasive wheel manufacture.

The Furans

FURFURAL
FURFURYL ALCOHOL
TETRAHYDROFURFURYL ALCOHOL
HYDROFURAMIDE

IMMEDIATE SHIPMENT

You need not wait months or even weeks for shipments. Orders for cans, drums, and tank car lots of Furfural are being filled immediately.

Containers are:	*Net Weight*	*Gross Weight*
Cans	9 lbs.	12 lbs.
"	45 "	55 "
"	90 "	105 "
Drums	520 "	573 "
Drum carloads, tank cars		

LOW COST

Are you thinking of Furfural as an expensive laboratory chemical? Many people are amazed to learn that in bulk it costs less than a dime a pound. Frequently, too, a few cc's of Furfural do the same work as much larger quantities of some other solvents. Many selective solvent users recover Furfural for reuse with remarkable success. Consequently the unit cost is low.

Ask for a copy of the free booklet entitled "The Furans" telling about Furfural and its derivatives. Copies of "Furfural As A Selective Solvent" describing the properties of Furfural of interest to oil refiners are also available.

Write for this Free Booklet

Principles and Practice of Chromatography. *L. Zechmeister* and *L. Cholnoky.* (Translated from the second and enlarged German edition by A. L. Bacharach and F. A. Robinson with a foreword by I. M. Heilbron.) xviii + 362 pp., 74 fig. John Wiley & Sons, Inc., 440 Fourth Ave., New York, N. Y., 1941. Price, $5.00.

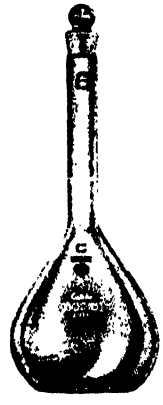
ENGLISH-SPEAKING chemists will welcome this authoritative translation of a volume which has become a chemical classic. The authors have made so many notable investigations in the field of chromatography that they can write with authority and conviction on the techniques involved and the type of problems which can be attacked by chromatographic techniques. The translators have retained the enthusiasm of the authors and have added occasional footnotes which either expand or clarify the text.

Chromatography was discovered by Tswett in 1906 and is a specialized type of selective adsorption from a solution flowing through an adsorbent in columnar form. Those components with high adsorption affinity are adsorbed close to the top of the column, and other compounds with lower adsorption affinities are adsorbed in bands in the lower portion of the column. Compounds with no adsorption affinities appear in the filtrate. When pigmented compounds are adsorbed, the Tswett bands appear as colored areas.

For many years the Tswett technique was used primarily as a qualitative method to determine whether pigment systems were homogeneous or heterogeneous. About 1931, however, it began to be used as a preparative technique. The adsorption bands were removed separately from the adsorption column, the adsorbed constituent was elutriated by some appropriate solvent or technique, and it was thus possible to secure readily many compounds in a pure state from mixtures which could not be separated easily by other means. Our present knowledge of many important biochemical compounds depends upon such separation and preparative techniques, and more and more laboratories are adopting such techniques for either routine analyses or as research methods.

The present volume discusses the general principles underlying chromatography, the general methods which may be used including types of apparatus, adsorption media, solvents, and elution techniques. Following this general section special attention is given to the application of chromatography to naturally occurring pigments, chlorophyll, hemin, the porphyrins, bile pigments, carotenoids, naphthoquinone and anthraquinone pigments, flavins, pterins, anthocyanins, etc. This is followed by a discussion of the behavior of synthetic dyestuffs and this, in turn, by a consideration of the technique with relation to colorless compounds of a great variety of types—*e. g.*, sterols, alkaloids, vitamins, hormones, enzymes, etc. The last two chapters deal with technological applications and inorganic chromatography, purification of inorganic compounds, and separation of mixtures of anions or cations. An excellent condensed bibliography and author and subject indexes conclude the volume. Unfortunately, some of the more recent literature is not included, references and text being only for material appearing prior to the summer of 1938. In spite of this limitation, the book is recommended as probably the most authoritative single source of information in this important and rapidly expanding field.

ROSS AIKEN GORTNER



PYREX VOLUMETRIC WARE HAS A BRAND *Control Laboratory* ALL ITS OWN

In addition to its general Research Laboratories, Corning also maintains a specialized Volumetric Control Laboratory.

Here skilled technicians maintain the accuracy of all calibrating instruments, check and double check calibrations on all catalog items and supervise the marking of volumetric ware made special to order.

All volumetric standards are in accordance with U. S. Bureau of Standards' recommendations. Standard "Pyrex" Volumetric Ware is held within twice the tolerance, while Corning Certified "Pyrex" Ware is held to within the tolerances and specifications prescribed by the Bureau.

Sturdy, accurate, made of *balanced* glass, "Pyrex" Volumetric Ware is recommended for all general purposes where a glass of high chemical stability is required. For work necessitating extreme accuracy, Corning Certified "Pyrex" Ware should be specified. Both are available through your regular source of supply.

PYREX BRAND LABORATORY WARE

"PYREX" and "VYCOR" are registered trade-marks and indicate manufacture by

Technical Report Writing. *Fred H. Rhodes.* 1st ed. 125 pages. McGraw-Hill Book Co., 330 West 42nd St., New York, N. Y., 1941. Price, $1.25.

THE need of a proper text on technical report writing, such as that by Fred H. Rhodes, of Cornell, and offered by McGraw-Hill's Chemical Engineering Series, has been generally apparent, frequently rather painfully so. As the author is a chemical engineer, it is possible that his introductory stress on the importance of effective report writing may obtain recognition from the technically minded student not always granted English departments. Too few young technical men are aware of the professional importance of being effectively articulate.

It is probably impossible to prepare such a book primarily for the undergraduate without including much that seems platitudinous. Experience with reports prepared by students who have completed undergraduate English continually shows the need of re-emphasis of much that is elementary. Presumably Professor Rhodes prepared his material as a text for a course in this subject, the more mathematical chapters being amplified in class work and supplemented by reference material. For others than students of such a course, it is possible that a more general treatment, indicating rather specifically where the various mathematical methods should be applied, would be more

constructive, especially if rather detailed reference could be given to more adequate treatments of these several subjects. As they now stand, these chapters are not fully satisfying to the laboratory worker who must use these methods, nor necessarily fully effective as a warning and guide to workers who need them only infrequently.

One great merit of the book is that it recognizes and calls to the reader's attention the fundamental importance of determining the statistical adequacy of the data on which the report is based. To its general discussion of this subject, little exception need be taken. It is unfortunate, however, that the author did not confine himself to a more extended general statement of the problem, and then refer the reader to appropriate statistical works for further detail. In its necessary brevity, the detailed instruction provided has the dangers of a little learning; it is inadequate for the judicious consideration of statistical problems.

Inclusion in a text of this type, of a chapter on The Method of Dimensional Analysis is also questionable as it offers only one of the several checks possible on equations used. Again, a more generalized discussion in an undergraduate course might be constructive and less hazardous for readers not supplementing the text through oral instruction or guidance.

It is hoped that this book will receive the wide distribution it deserves, not only among undergraduates where its general discussion and specific suggestions will be found valuable. It should serve to reduce the burden on many a research director who must read and revise report material for action or for presentation to lay executives.

Salvage in the Milk Industry

In "Treatment and Disposal of Waste Waters from Dairies and Milk Products Factories", Water Pollution Research Technical Paper No. 8 issued by the Department of Scientific and Industrial Research (England), information is given on the amounts of materials, such as milk, whey, and buttermilk, carried away in waste waters from the milk industry. Reduction of these losses by simple modifications in operations and by careful control of draining and washing equipment is discussed. The paper indicates that at least 3,000,000 gallons a year could be saved on the milk handled at all factories in Great Britain. On the problem of disposal of milk waste waters, purification by the activated sludge process and by filtration in percolating filters is suggested. Details are given on design and size of plant required. The paper is available from H. M. Stationery Office, London, at 4s. plus postage.

Explosives Treated with Fire-Retardant Chemicals

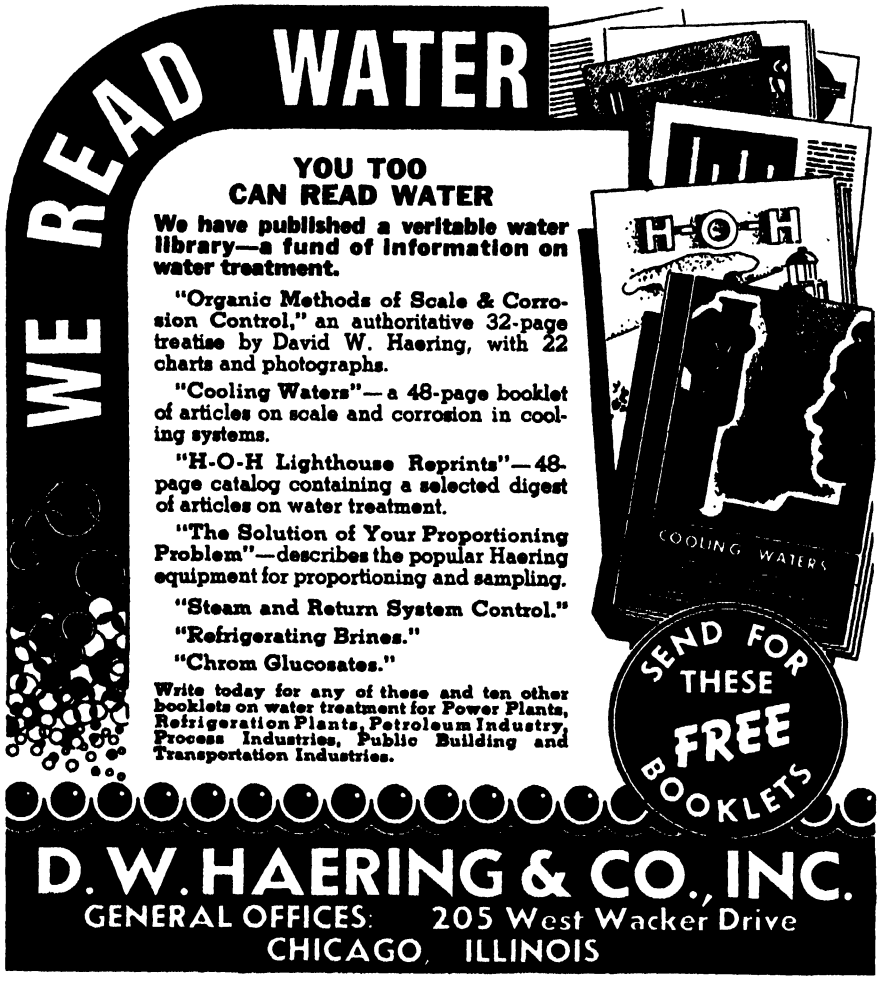
Liquid-oxygen explosives, highly flammable and subject to accidental ignition, have been rendered safer by treatment with fire-retardant chemicals developed by the U. S. Bureau of Mines. Liquid-oxygen explosives are commonly made from a carbonaceous absorbent and liquid oxygen of high purity. The treatment consists of spraying the absorbent with watery solutions of phosphoric acid before it is charged into the cartridge. For additional protection the canvas wrappers in which packed cartridges are stored are soaked or sprayed with solutions of ammonium phosphate, ammonium chloride, or phosphoric acid.

Although treated explosives will withstand most of the ordinary conditions of handling, certain inherent hazards remain, especially when large charges are exposed to extremely violent igniting agents. For this reason it is recommended that the usual safety precautions be exercised.

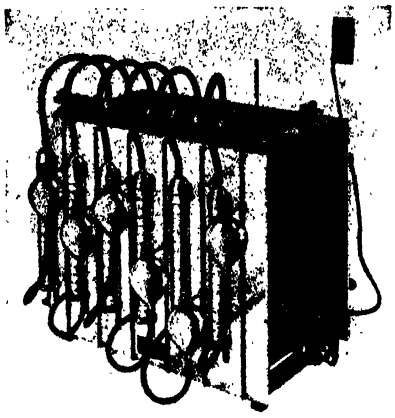
A report of the study may be obtained by requesting Report of Investigations 3605, "Practical Fire-Sensitivity of Liquid-Oxygen Explosives Treated with Fire-Retardants", by A. R. T. Donues, from the Bureau of Mines, U. S. Department of the Interior, Washington, D. C.

Foote-Prints

The December 1941 issue of *Foote-Prints*, published by the Foote Mineral Co., 1609 Summer St., Philadelphia, contains an article by F. B. Shay on the "Fine Grinding of Minerals", of particular interest with reference to the grinding and processing of chemicals and ores. Norbert J. Kreidl of Pennsylvania State is the author of "The Possibilities of Strontia in Ceramics". The publication also contains analyses and information on inorganic chemicals, metals, alloys, and minerals.



FSA Designates Habit-Forming Drugs



A regulation designating habit-forming chemical derivatives of substances named in section 502 (d) of the Federal Food, Drug, and Cosmetic Act has been issued. The order will become effective April 23, and is based on evidence presented at the public hearing in March 1941. Copies of the *Federal Register* of January 23, in which the regulation is published, may be obtained from the Superintendent of Documents, Government Printing Office, Washington, D. C., at 10 cents each.

Rubber Products

The December 1941 edition of A. S. T. M. Standards on Rubber Products, an annual publication sponsored by the American Society for Testing Materials' Committee D-11 on Rubber Products, contains the 39 specifications and methods of test in their latest approved forms. The 10-page bibliography gives recent sources of information on mechanical testing of rubber. Copies in heavy paper binding may be obtained from A. S. T. M. Headquarters, 260 South Broad St., Philadelphia, Penna., at $1.75 each.

Index to A. S. T. M. Standards, Including Tentative Standards. 196 pages. American Society for Testing Materials, 260 South Broad St., Philadelphia, Penna., December 1941. Free of charge on request.

For Determining

THIAMINE (VITAMIN B_1)

by the yeast fermentation method

Fleischmann AMINCO *Laboratory*

FERMENTOMETER

★ Five different or similar samples and the control can be run simultaneously.
★ A great time saver over other methods of thiamine determination. Complete tests are made in 3 hours by persons who need not have technical knowledge.
★ Applied successfully to all foods, many biological fluids, plant and animal tissues, metabolic studies, etc. Useful for both research and control.

Liquefied Petroleum Gas in 1941

THE year 1941 in the liquefied petroleum gas industry made new highs in marketed production for all types of uses in spite of the difficulty in obtaining materials for new installations, curtailment of sales activities in many quarters because of inability to secure customer equipment and appliances, and restrictions on appliance financing. It saw a great increase in the industrial uses of liquefied gases in defense work and an increase in the amounts of certain associated hydrocarbons used in the manufacture of synthetic rubber and plastics.

The estimated marketed production of liquefied petroleum gas during 1941 was 445,000,000 gallons, compared with 313,456,000 gallons for 1940, or an increase of 42 per cent. This includes all liquefied petroleum gas (propane, butane, butane-propane mixtures, and pentane) when sold as such, but not butane when blended with heavier petroleum fractions for motor-fuel purposes nor sales of hydrocarbon gases delivered by pipe line in the gaseous state to certain large chemical concerns located adjacent to the points of production of the hydrocarbon gases.

The estimated domestic use of liquefied petroleum gas in 1941 amounts to 221,880,000 gallons, an increase of 65.5 per cent over 1940, when 134,018,000 gallons (42.7 per cent) were so consumed. The number of new domestic users of liquefied petroleum gas increased approximately 520,000 during the year. It is now estimated that there are a total of 1,645,000 users of liquefied petroleum gas in

Synthetic rubber manufacture

STEAM JET EVACTORS
AIDING NATIONAL DEFENSE

Numerous Croll-Reynolds Evactors are working overtime maintaining high vacuum in plants making explosives, synthetic rubber, airplane lubricants and a long list of other ordnance materials. They are maintaining high vacuum on engines and turbines of dozens of American ships sailing the seven seas.

While the large and special units require up to three months or more for fabrication the smaller ones are sometimes made in two weeks, or less, when the demand is urgent. These include single and multi-stage units for vacuum up to a small fraction of 1 mm. absolute, also small condensers and vacuum chilling equipment.

A recent development is a vacuum-cooled condenser for maintaining condensing temperatures down to 34° F. Inquiries will be handled as promptly as possible under the circumstances.

Liquefied Petroleum Gas in 1941

CONTINUED FROM PAGE 214

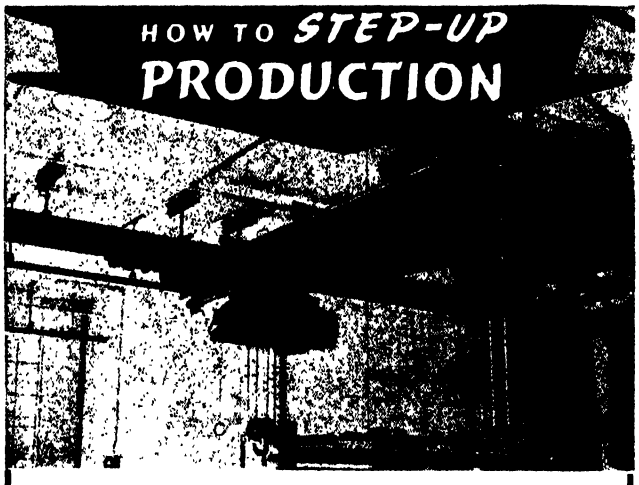
the domestic and small commercial classification.

Many new industrial installations were made, principally in the heavy manufacturing areas in the North and East, and a majority use propane, delivered in tank-car quantities. From these installations, liquefied petroleum gas is used in the manufacture of battleships, machine guns, tanks, hydraulic pumps, aluminum shapes, shells, airplane parts, cruisers, destroyers, tankers, and ordnance of all types. Many large industrial concerns have installed liquefied petroleum gas systems as standby to ensure gas service for vital manufacturing operations during periods when the utility system has high peak loads.

Liquefied petroleum gas systems have been installed to furnish piped gas service for several large housing projects in defense areas. Over 200 cities are now employing or arranging to use undiluted butane or propane, propane-air, butane-air, propane, butane, or mixtures for the sole source of gas or for standby, peak load control, or enrichment. Increasing quantities of liquefied petroleum gas were transported direct from gasoline plants or refineries to consumers, or from pipe line terminals to consumers in 1941.

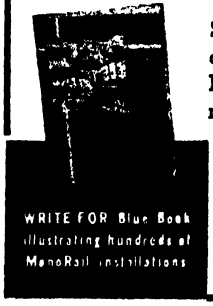
In the chemical field, liquefied petroleum gases became an increasingly important source of raw material. Volume shipments of special grades of propane, *n*-butane, isobutane, and butadiene were made for use in the manufacture of nitroparaffins, plastics, and synthetic rubber. For experimental and pilot plant operations such special hydrocarbons as propylene, butylene, isobutylene, and others are now available in pure and technical grades.

Competition for the domestic markets continues keen from both within and without the industry, electricity being the principal competitor from without the industry. Prices within the industry have, in general, strengthened, particularly in the Southwest. New uses began to require appreciable volumes of hydrocarbons in the liquefied gas range. Among these were butadiene and isoheptene for manufacturing synthetic rubber, diolefins for plastics, propane for nitroparaffins, and *n*-butane for conversion into isobutane in the manufacture of aviation gasoline by the isomerization and alkylation processes.



The year 1941 saw the first large-scale installation of propane-fired heaters for removing accumulations of ice and snow on switches in railroad yards.

Additional special high-pressure tank cars and transport trucks were required to deliver the increased volumes in 1941. It is estimated that orders for more than 200 new tank cars were placed with car builders in 1941.



Twenty-seven states have enacted laws requiring payment of motor fuel taxes on only those quantities of liquefied petroleum gas sold or used to propel motor vehicles upon the public highway.

In 1941 additional states adopted rules and regulations governing the safe storage, handling, transportation, and utilization of liquefied petroleum gas. A large percentage of these regulations were in substantial conformity with the National Board of Fire Underwriters' standards. Seventeen states now have liquefied petroleum gas rules and regulations.

As the year 1941 ended, the liquefied petroleum gas industry found itself in a most difficult position from the standpoint of obtaining equipment with which to make new customer installations in 1942. With war underway, new sales probably will come close to a halt as soon as the available warehouse stocks are used. Equipment companies catering largely to the liquefied petroleum gas industry already have or are rapidly switching over a portion of plant facilities from the manu-

LET an American MonoRail engineer show you how an overhead handling system can reduce idle machine time, coordinate handling with process, eliminate multiple handling, avoid damage in transit, and enable you to plan exact schedules of production.

Size of plant, nature of product, weight of load make little difference; American MonoRail equipment is engineered to meet the particular requirement of each problem. This expert advice is yours for the asking.

THE AMERICAN MONORAIL CO.

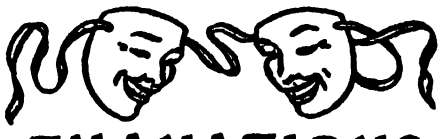
facture of liquefied petroleum gas industry articles to war items. However, marketers and equipment manufacturers have spent considerable time on research work connected with development and use of substitute or alternate materials and equipment with noteworthy success. These efforts are being continued.



Eighteen states now have liquefied petroleum gas production.

One trend in refining technology relating to the manufacture of aviation gasoline, which will have a pronounced effect on the available supply of butanes to the liquefied petroleum gas industry, is the process of isomerization of normal butane into isobutane, with the isobutane then being converted into aviation gasoline by either the thermal or catalytic alkylation processes. The demands for tremendous quantities of aviation gasoline under the war program have greatly stimulated the installation of new large capacity isomerization and alkylation plants, and plans for further expansion along these lines throughout the petroleum industry are well under way.

Cuba Imports Glue from U. S.

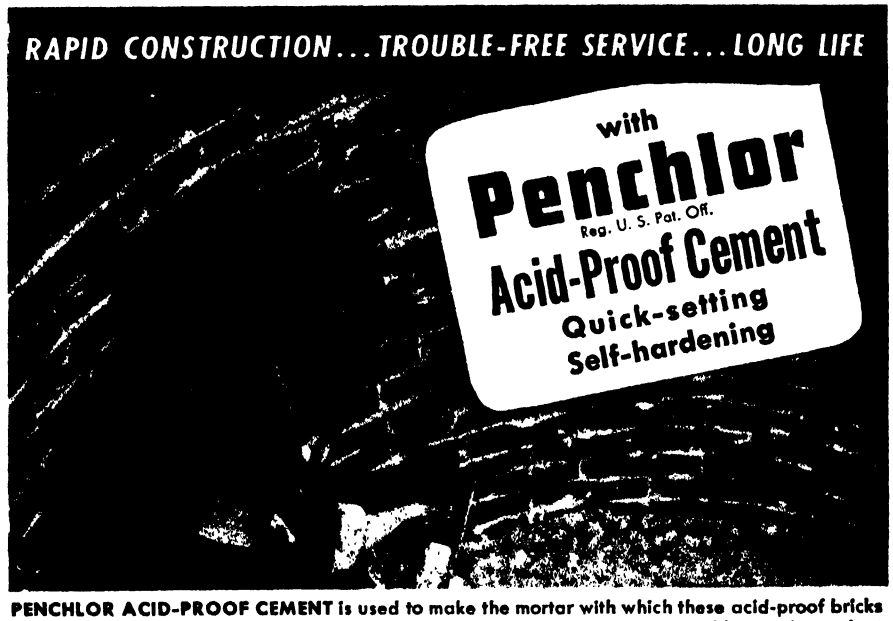
UNITED STATES exports of glues of animal derivation, shipped to Cuba, amounted to 88,600 pounds valued at $15,900 in 1940, compared with 121,100 pounds at $21,600 in 1939. Glues and gelatins are sold in Cuba through the large wholesale drug, chemical, and hardware concerns, while some larger furniture manufacturers import glue for their own account.

TOTAL mine production of recoverable gold in the United States, territories included, was 5,858,871 fine ounces in 1941, a decrease of 2 per cent from 5,984,163 ounces in 1940, according to preliminary figures of the U. S. Bureau of Mines. The value of the gold, calculated at $35 per fine ounce, was $205,060,485 in 1941 and $209,445,705 in 1940.

EMANATIONS

IN A chemistry test the teacher wrote on the blackboard, "Explain the following terms, and give examples", ending the list with "complex ions". Mr. X—— struggled with this for some minutes, and finally wrote, "I don't think complexions can be explained, but I know my girl's is just swell."

CONTRIBUTED



Egyptian Chemical Trade Reported Good

CONTINUED news is being received of favorable conditions in the Egyptian chemical trade. Because of disturbed business conditions brought about by the war, a recent report stated, it is almost impossible to forecast accurately with regard to any phase of economic activity in Egypt. Conditions in the Egyptian chemical trade at the end of the summer, however, indicated a satisfactory turnover for the entire year 1941.

Fertilizer imports, which represented more than half of the total chemical and allied products trade, were expected to be maintained at a satisfactory level.

ITALY is sharply restricting exports of both lemons and raw materials required for preparation of tartaric acid. Lemons are being curtailed to offset a shortage of citric acid while, in the case of pharmaceutical citric acid, efforts are being made to hurry expanded production plans.

VALERIAN root is under extensive cultivation in Chile, with a view to its exportation.

PENCHLOR ACID-PROOF CEMENT is used to make the mortar with which these acid-proof bricks are being laid in lining a tank to store hot dilute sulphuric acid at the chemical by-products plant of the Chesapeake-Camp Corp., Franklin, Va. Construction Contractors: A. Lynn Thomas Co., Inc., Richmond, Va.

Here is another installation where *Penchlor Acid-Proof Cement* will prove its worth in years of dependable service. This quick-setting sodium silicate cement was chosen because of its proven record of highly satisfactory service under severe acid conditions . . . a record that includes successful application in most of the important chemical plants throughout the United States, in steel mills, in paper and pulp mills, oil refineries and smelting plants.

With time a vital factor in new construction, the quick-setting and self-hardening qualities of Penchlor Acid-Proof Cement are a greater advantage than ever. There need be no delays in putting brick-lined equipment into service.

If your conditions require a corrosion-proof cement with unusual strength and exceptional resistance to abrasion, use one of our resin cements, such as *Asplit* for conditions which are always acid—or *Causplit* for conditions alternately acid and alkaline. You will find these easy to handle and capable of withstanding a wide range of corrosive conditions at temperatures up to 350 degrees F.

Long experience in our own chemical plants in handling acids and alkalis makes it possible for us to put seasoned engineering service at your disposal—without obligation, of course. Write us fully. Or if you prefer, use the coupon below.

Uruguay Consumption of Arsenic Is 1,000 Tons

URUGUAY is reported to have an annual consumption of approximately 1,000 tons of arsenic, used principally in preparation of cattle and sheep dips, insecticides, and weed killers. Although a private concern imports this substance, arsenical preparations are distributed locally by two government agencies, the Institute of Industrial Chemistry and Department of Agriculture.

Italy's Agricultural Chemical Industry May Be Expanded

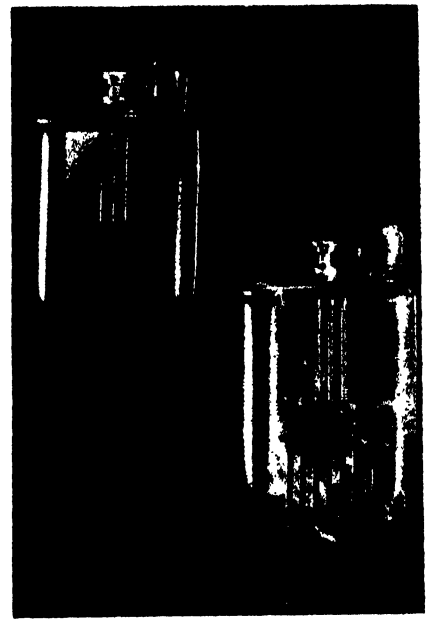
ITALY'S chemical industry is contemplating large plans for increasing self-sufficiency, despite war difficulties, according to discussions published abroad.

The industry comprises 4,500 concerns, with capital investment totaling 38,000,000,000 lire. Most of the discussion centers about expansion of the agricultural chemical industry, important to the national economy. The chemical industry supplied the country's agriculture with insecticides, fungicides, herbicides, and similar products.

As recently reported, owing to cessation of copper imports, with annual requirements of 25,000 to 30,000 tons for preparation of copper sulfate alone, sale of copper sulfate is coming under strict control.

Monsanto Turns Plant Over to the Army

THE Chemical Warfare Service's St. Louis Plant No. 1, located at Monsanto, Ill., an industrial community on the banks of the Mississippi River across from St. Louis, has been turned over to the Army by Monsanto Chemical Co., the engineering and supervising constructing contractor, on time and at a cost less than estimates and for a supervising fee less than the Government's agreement specified.



The chemicals to be produced in the plant, according to the Chemical Warfare Service's original announcement, are to be used by the service in the manufacture of gas protective equipment for troops.

Navy E and Bureau of Ordnance Awards

THE Navy E and the Navy Bureau of Ordnance flag have been awarded to the Bethlehem Foundry & Machine Co., the Monsanto Chemical Co. generally and the Anniston, Ala., and Monsanto, Tenn., plants of Monsanto specifically for outstanding performance in the production of naval ordnance materiel vital to national defense. Employees of these plants will be accorded the privilege of wearing the Navy E and the Bureau of Ordnance seal. The Monsanto ceremonies of award occurred on January 21 and 22.

MODERN PULP AND PAPER MAKING

by George S. Witham, Sr.

SECOND EDITION — Revised and Greatly Enlarged

The second completely revised and greatly enlarged edition of this standard American treatise on the pulp and paper industry demonstrates the fact that it was written by a man who was not only a master paper-maker but thoroughly in touch with all the latest developments in paper technology. This book is not only invaluable to the technologist but also a real practical help to machine tenders, beater men, digester cooks, and other practical workers in the pulp and paper industry. The outstanding feature of the first edition of Mr. Witham's treatise was its practicality and this has been extended and accentuated in the second edition.

Special features of the revised edition include: new methods of wood preparation peculiar to the Pacific Coast and the South; new cooking processes, modifications of the sulphite process, forced circulation, etc.; new developments in recovery processes; improvements in paper machine design, and criticism of these developments based on the author's own experience; recent improvements in ground-wood manufacture; automatic control; new types of equipment — refiners, screens, thickeners, special bleaching equipment, continuous rotary filters and other things new to the industry since the publication of his first book; thorough checking and modernization of all figures as to power consumption, capacity, etc.; and great attention to new acid-resisting materials such as Monel metal, stainless steel, chromium-plate, rubber linings, etc.

An entire chapter has been added on converting and coating; the chapter on the finishing room has been greatly amplified based on the author's activities in his later years. There is much added material on tissues, glassine, boards and other specialties. The chapter on bleaching has been greatly enlarged and amply covers modern practice. At the same time all the notable features of the original book have been conserved and strengthened.

700 Pages **Profusely Illustrated** **Price $6.75**

EASTMAN KODAK COMPANY, CHEMICAL SALES DIVISION, ROCHESTER, N. Y.

Industrial Uses of Silver

SILVER, abundantly available in world markets, has been suggested as a substitute for defense-scarce copper, brass, stainless steel, and other metals by the American Silver Producers' Research Project under direction of Handy & Harman. During the past decade, quite independent of silverware, the industry has increased its consumption to several million ounces annually. Although silver is replacing some metals not available for nondefense applications, especially where material costs are low in relation to total cost, its primary industrial uses are based on its merits. This easily worked metal is obtainable in sheets, strips, rod, tube, and wire, a variety of alloys with diverse properties, and certain metals clad with silver. Its resistance to corrosion and electrical and heat conductivity are high.

Information on silver and its uses, collected by the project, 82 Fulton St., New York, is available without cost to manufacturers. Under the project the metal in a variety of forms can be consigned without charge to responsible manufacturers prepared to apply it in solution of new research and development problems.

To conserve tin, the project announces two types of lead-silver solders containing no tin. One of these is the eutectic alloy which contains 2.5 per cent silver and 97.5 per cent lead. It flows at about 580° F. The other is a proprietary alloy composed of 2.5 per cent silver, 0.25 per cent copper, and 97.25 per cent lead. It starts to melt at about 580° F. and flows at about 661° F. These relatively soft solders should not be confused with the silver brazing alloys and hard silver solders having melting points of 1175° to 1600° F. A lead-silver solder containing 2.5 per cent silver costs less than lead-tin solders in which the tin content is above 25 per cent, according to the project's report.

Silver for Bus Bars

Now that copper production can barely keep pace with defense needs, the use of silver in bus bars has been suggested. If power plants replaced copper bus bars with those made of silver, thousands of tons of high-purity copper could be released for defense applications. The silver presumably would come from reserves now idle in government vaults or from newly mined silver. It might be lent and returned later when needs for copper are less pressing.

Silver is the best electrical conductor known and has other excellent physical properties suiting it for use in bus bars. It is easily fabricated and can be silver soldered or brazed with silver alloys in the same way that copper bus bars are brazed.

Loosening Glass Stopcocks and Glass Fittings

IT IS common experience in all laboratories where glass equipment is used intermittently by various chemists that a certain percentage of equipment having glass stopcocks become valueless because of frozen stopcocks. Heretofore, a flame or, in the case of ordinary flint glass stopcocks, hot water has been used to loosen the plug. In most cases, the result is either a broken stem or cracked valve seat.

An extremely simple method of loosening these stopcocks or any frozen glass fitting is to immerse the equipment in a dilute solution of Aerosol OT (du Pont), made by adding 1 ounce of 10 per cent Aerosol OT to 1 liter of water. The frozen glass stopcock is allowed to stand immersed in the solution until it can be turned freely. This usually takes from 2 to 24 hours, depending on the condition of the equipment.

THE GOODS OF WAR AND THE GOODS OF PEACE—

Mean Prater

The process industries are facing terrific demand. Not only must they take on the burden for goods of war—they must also supply materials to replace those ordinarily used for goods of peace. Dependable high production equipment is a necessity.

Many of the newer phases of processing rely on Prater Processing Equipment. In the soya industry, grinding is almost 100% by Prater Mills.

Every Prater Mill is sold on a basis of guaranteed output per horsepower hour and control of quality of grind, and grain size, after analysis of your problem.

Write for any desired information.

The **Hercules Powder Co.** reports that net sales of goods and services for 1941 were $85,612,161, an increase of 63.3 per cent over the previous year, in addition to which the company was engaged on large projects for the construction and operation of munitions plants for the Government. Approximately $4,887,000 was spent during the year in the improvement and expansion of plant facilities, consisting largely of reconstruction of the Kenvil, N. J., plant damaged by explosion and additions to capacities of plants for the production of cellulose acetate, ethyl cellulose, chlorinated rubber, nitric acid, purified cotton linters, and synthetic resins. On December 31, 1941, the board of directors declared a regular quarterly dividend of 1.5 per cent on preferred, payable February 13 to stockholders of record February 2. A year-end dividend of $1.20 a share on common was declared payable December 19 to stockholders of record on December 8.

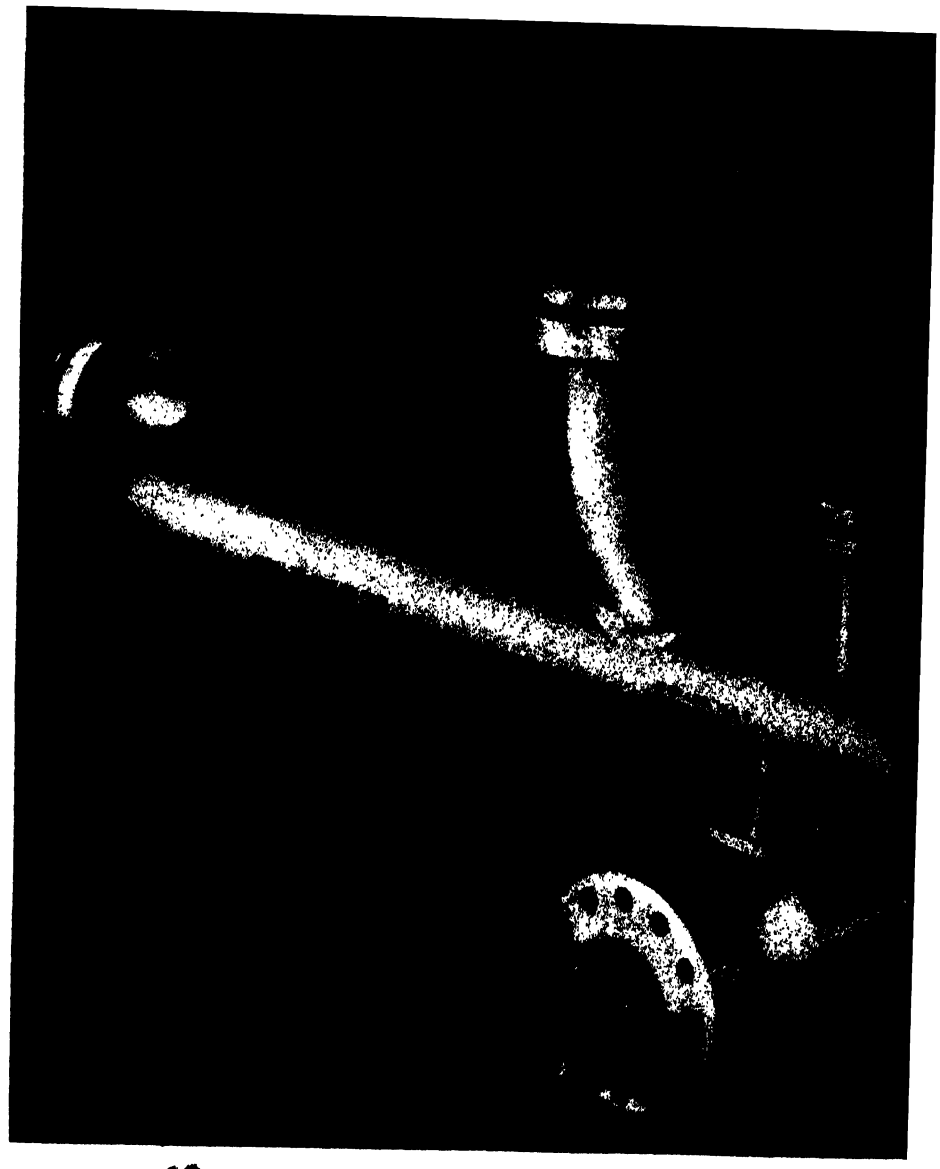
The **General Refractories Co.** has completed the sale to insurance companies of $3,000,000 principal amount 3.25 per cent promissory notes, due January 1, 1957. Out of the proceeds the company has paid its outstanding 3.75 per cent first mortgage sinking fund bonds, due January 1, 1949, and the balance is to be used for modernization and expansion of present plants, purchase and conversion of a face brick plant at Malakoff, Tex., into a fire brick plant, advances to the company's Cuban subsidiary for purchase and development of chrome ore leases in Cuba, advances to the Northwest Magnesite Co. for increasing facilities, and additional working capital.

Fluorescent Lamp Production

Drying fluorescent coating inside glass tubes at the new Westinghouse Fairmont, W. Va., works. All the lacquer, which is used to deposit evenly the fluorescent coating, is removed by the high temperature of the oven. The plant was designed to make 100 lamps per minute.

Refiners Spend $20,000,000 Yearly for Research

A PETROLEUM-CHEMICAL industry whose "limits of further expansion would be hazardous to predict", in the opinion of two U. S. Bureau of Mines experts, has been developing through the past decade. Continuing research programs on which the refining industry is spending about $20,000,000 annually foretell rapid expansion in the future.



Among major industries that maintain research laboratories, H. C. Miller and G. B. Shea of the bureau's technical staff report, the growth of petroleum research has been the most rapid in the past decade. Next to the chemical industry, more workers are engaged in petroleum research than in any other industry. According to available information, less than 1,000 employees were engaged in petroleum research in 1927, compared with more than 5,000 in 1938, representing one eighth of all the research workers employed by all industries in the United States during that year.

Technologists trace development of petroleum refining from simple distillation through thermal cracking to the many catalytic-synthetic processes introduced since 1930, the third period in the advance of refining. The industry can obtain virtually what it desires from petroleum and its gaseous hydrocarbons by an increasing variety of catalytic and synthetic processes, which give the flexibility so desirable and necessary for profitable operations, they report.

Plastic Vacuum Sweeper

Tenite replaces aluminum in the Premier Pic-Up hand vacuum sweeper. This change in material not only saves metal vital to war industries but, due to the nonabrasive surface of the plastic, it also minimizes danger of scratching furniture. It is molded of the Tennessee Eastman product by Zenith Plastics, Inc., Cleveland, Ohio, for the Electric Vacuum Cleaner Co.

WHEN defense orders necessitate added power piping in your plant, take this short-cut through the special engineering and prefabrication problems that precede installation. "Give the plans to Grinnell", and you'll "sub-contract" all the troubles of interpreting super-pressure steam requirements into super-power piping.

Grinnell engineers are power specialists, qualified by long experience to interpret even the most complex power problems into speedily-erected, underwriter-approved piping systems. Grinnell plants, strategically located to serve defense industries, are equipped with every last facility to prefabricate these systems.

Grinnell is helping leading manufacturers, utilities and process plants to meet defense needs for added power. Write for Data Book, "Grinnell Prefabricated Piping". Grinnell Company, Inc., Executive Offices, Providence, Rhode Island. Branch Offices in principal cities of the United States and Canada.

HAVEG

Here is Chemical Equipment whose corrosion resistance does not depend on merely a surface lining... HAVEG is corrosion resistant throughout its entire mass. HAVEG is a strong, tough and durable molded plastic... impervious to rapid temperature changes... unaffected by temperatures up to 265° F. It is being successfully used in acetic acid service... hydrochloric... hydrofluoric... sulphuric up to 50% concentration.

Available as PIPING... VALVES... FITTINGS... FUME DUCT... TANKS... TOWERS... seamless one piece units as large as 9' diameter and 9' high.

HAVEG equipment and piping is available in a wide range of standard sizes... completely described in bulletin F16. Send for your copy today.

HAVEG CORP.
NEWARK, DELAWARE

INDUSTRIAL LITERATURE

Listed publications should be requested directly from the company concerned. Use business stationery, mention bulletin numbers, and refer to this journal. Publications will be sent free unless otherwise noted.

High-Pressure Condensate Return. A 4-page bulletin lists 50 industries in which increases in production rates and fuel savings are made by use of this system, and describes a typical installation with diagram. *Publication 3025 IE.* COCHRANE CORP., 17th and Allegheny Ave., Philadelphia, Penna.

Laboratory Rheostats. Jagabi Lubritact laboratory rheostats are described in a 4-page illustrated bulletin. *Bulletin 1705-IE.* JAMES G. BIDDLE CO., 1211 Arch St., Philadelphia, Penna.

Light Reflection. A bulletin entitled "Better Light Reflection—More Production" points out with graphs and figures the importance of proper lighting. *Bulletin 533-IE.* THE TRUSCON LABORATORIES, Caniff & G. T. R. R., Detroit, Mich.

Pipet Aspirator. This pamphlet describes a handy device which fits any size pipet. It will draw up a desired quantity of solution and discharge with accuracy greater than 0.01 cc. *Once Again... Progress Speaks Pamphlet IE.* THE CAMPBELL CO., Hammonton, N. J.

Plexiglas. A manual of 47 pages details storage, handling, forming, cementing, and repairing of this plastic material. Prepared specifically for the Army, Navy, and industrial firms using Plexiglas in defense manufacture, the publication is available to other users of thermoplastics. *Plexiglas Fabricating Manual IE.* RÖHM & HAAS CO., 222 West Washington Square, Philadelphia, Penna.

Porcelain Enamel. This 24-page booklet discusses the different types of porcelain enamels and describes the drying trays, cascade pans, small tanks, and screens to which they are applied. *Vitreo for Process Industries Booklet IE.* VITREOUS STEEL PRODUCTS CO., Cleveland, Ohio.

Power Recording Instruments. A 28-page catalog covers the use of continuous-recording load meters. Equipment is listed which can telemeter over practically any distance, and totalize the load of almost any number and combination of generators, stations, and tie lines. *Catalog N-58-161 IE.* LEEDS & NORTHRUP CO., 4934 Stenton Ave., Philadelphia, Penna.

Pressure Filter. A pamphlet describes a continuous rotary leaf pressure filter. Other products, including filters, evaporators, and process equipment, are listed. *McCaskell Continuous Rotary Leaf Pressure Filter Pamphlet IE.* GOSLIN-BIRMINGHAM MFG. CO., INC., Birmingham, Ala.

Pumps. This attractive 24-page catalog on vertical pumps gives a series of comparisons between detailed installation drawings and the case histories of such installations in use. Seven types of operations are shown. *Bulletin 29-A107 IE.* POMONA PUMP CO., 206 East Commercial St., Pomona, Calif.

Resin and Lacquer Emulsions. A 3-page mimeographed paper discusses the behavior of emulsions and dispersions of resins and lacquers. *Theory, Practice, and Uses of Resin and Lacquer Emulsions Pamphlet IE.* AMERICAN RESINOUS PRODUCTS CORP., Peabody, Mass.

Rotamatic Controller. This publication is a new addition to the rotameter series, capable of controlling flow automatically. The unit, consisting of a rotameter with attached induction transmitter, remote recorder, and air-controlled diaphragm motor valve, is supplied for either liquids or gases. *Catalog Section 51-B IE.* FISHER & PORTER CO., Hatboro, Penna.

Rotary Kilns. A well-illustrated 16-page bulletin shows rotary kilns in various stages of manufacture and installation and describes auxiliary equipment. Some of the latest contributions to rotary kiln design are given. *Bulletin 770 IE.* KENNEDY-VAN SAUN MFG. & ENG. CORP., 2 Park Ave., New York, N. Y.

Rotary Pumps. An 8-page bulletin is devoted to helical-gear, spur-gear, and plunger pumps capable of handling viscous or nonviscous, hot or cold, or even abrasive liquids. Also shown are high-vacuum units. A convenient index, based on liquids to be pumped, is included. *Bulletin 19 IE.* KINNEY MFG. CO., Boston, Mass.

Sludge and Sewage Pumps. A 4-page bulletin describes a line of pumps designed to handle liquids containing various solid and fibrous materials in suspension. *Bulletin 206-2 IE.* LAWRENCE MACHINE AND PUMP CORP., 371 Market St., Lawrence, Mass.

Stainless Steel Casting Alloys. A 4-

page bulletin lists the designations, analyses, and physical properties of these corrosion- and heat-resistant casting alloys. *Stainless Steel Castings Reference Chart IE.* LEBANON STEEL FOUNDRY, Lebanon, Penna.

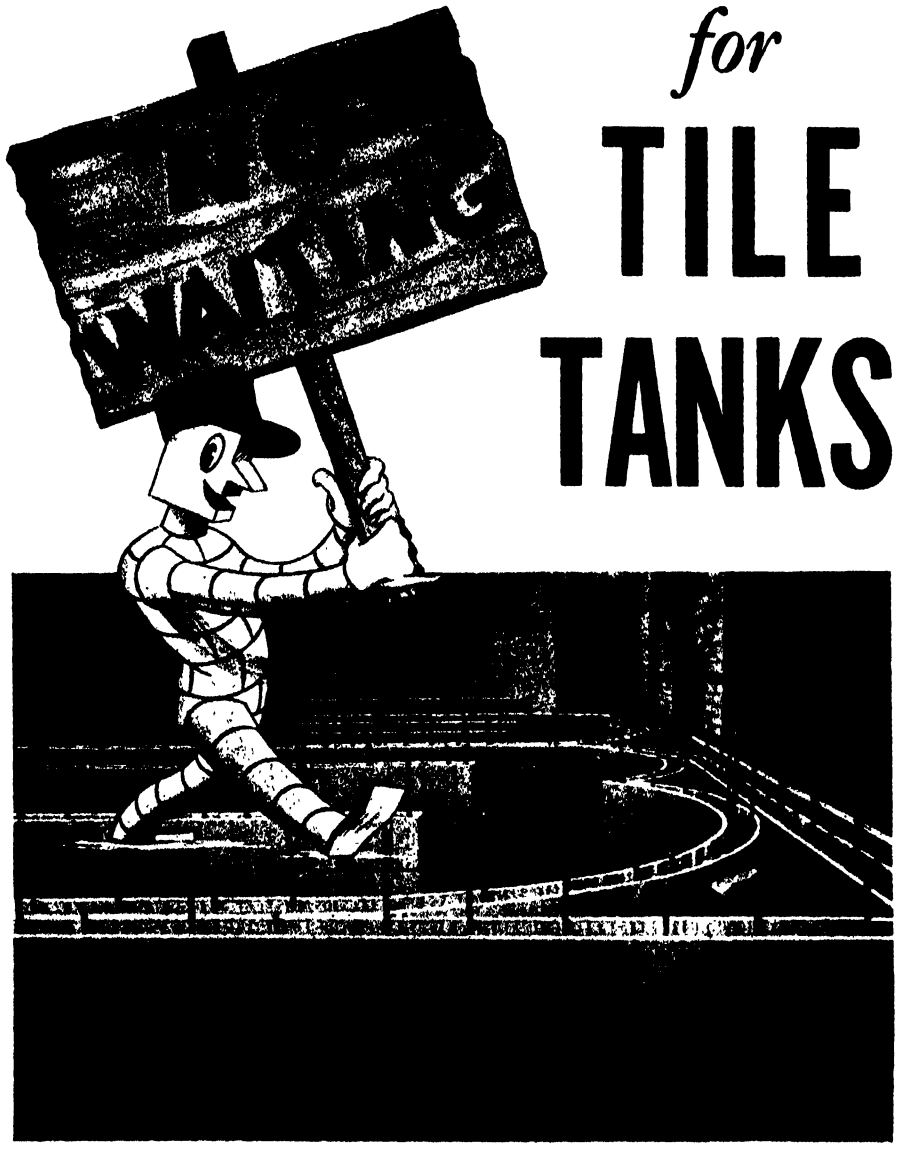
Traps. A recently revised 16-page bulletin gives complete information on construction features, operating principles, installation, and operation of Yarway impulse steam traps. *Bulletin T-1736 IE.* YARNALL-WARING CO., Chestnut Hill, Philadelphia, Penna.

Tube Stills and Heaters. This 4-page bulletin discusses uses and advantages of portable and sectional tube stills and heaters. These units provide a new low-cost method of heating crude, fuel oil, asphalt, water, and other liquids. *Bulletin 41 IE.* INDUSTRIAL ENGINEERS, INC., 819-A East 59th St., Los Angeles, Calif.

Vibrating Screens. A 4-page illustrated bulletin describes the Style M Robins-Vibrex vibrating screen. *Bulletin 118-IE.* ROBINS CONVEYING BELT CO., Passaic, N. J.

Water Purification. An 8-page illustrated bulletin describes the Model A Sterozone unit for water purification, including a flowsheet and analysis of Sterozone-treated water. *Bulletin IE.* TECHNICRAFT ENGINEERING CO., DIVISION OF LANE-WELLS CO., 5610 South Soto St., Los Angeles, Calif.

Wet Dust Collectors. A 16-page illustrated bulletin covers the theory and operation of a series of wet-type dust collectors, said to be free from maintenance requirements. A method of recovering water for re-use is shown. *Bulletin 110 IE.* CLAUDE B. SCHNEIBLE CO., 3951 Lawrence Ave., Chicago, Ill.



Worm Gear Drives. This 8-page pictorial booklet is devoted to the service performance of Cleveland drives, based on experience in a variety of industries. *Form 160 IE.* CLEVELAND WORM & GEAR CO., 3277 East 80th St., Cleveland.

Zeolite Softeners. A 12-page bulletin discusses the theory and operation of Zeolite softeners. Six methods for softening water are shown on a flow chart. *Form 307 IE.* GRAVER TANK & MFG. CO., INC., East Chicago, Ind.

Zeolite Water Purifier. This bulletin describes a Zeolite purifier unit said to produce water comparable to that which has been single-distilled. Other products mentioned in the bulletin are feed-water treatment plants, Zeolite softeners, and filters. *Distilled Water Without Heat Bulletin IE.* ILLINOIS WATER TREATMENT CO., 840 Cedar St., Rockford, Ill.

Direct Radiant Gas-Fired Kilns

DIRECT firing of ceramic kilns with radiant refractory-cup gas burners, pioneered 14 months ago in the 125-foot circular bisque kiln at Lenox, Inc., Trenton, N. J., has now been applied by at least seven producers to 13 kilns. The latest contracts announced by the Selas Co., Philadelphia, Penna., cover kilns for Globe Union, Inc., Milwaukee, Isolantite, Inc., Belleville, N. J., and Henry L. Crowley & Co., West Orange, N. J.

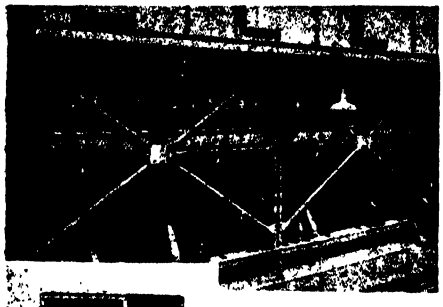
Firms wishing to store sludges, brines, bleaching solutions, process water, pulps, dust, salts, granular products, etc., need not be inconvenienced. We can provide a tile tank or silo for these purposes which has these significant advantages:

(1) The durability of reinforced concrete
(2) The cleanliness of glazed tile construction
(3) The economy of construction
(4) The vital advantage of quick delivery

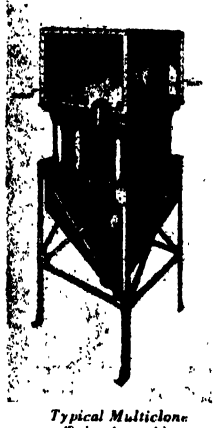
The installation job will be handled by an organization which has specialized for more than half a century in the installation of acid and corrosion resistant linings. Their construction permits quick assembly in limited space and at locations in plants where the problem of handling other types of tanks is troublesome.

SEMCO
Stebbins Engineering and Manufacturing Company
365 EASTERN BLVD. WATERTOWN, NEW YORK

THIS IS NOT THE TIME TO EXPERIMENT



The call today is for speed and more speed. There is no time to try this or try that; materials and men are too precious to waste on experiments.



That's why plant owners turn instinctively to Western Precipitation when they have a dust problem to solve.

Dust out of control leads to litigation, impairs health, lowers employee efficiency, and destroys buildings and machinery.

Multiclones eliminate these dangers. They combine the advantages of low first cost, low operating cost, compactness and high efficiency. Multiclones are fireproof. They have no cloth parts to clog, to be cleaned or replaced.

In addition to the collection of fly ash and all kinds of nuisance dusts, Multiclones are widely used in the process industries for the final collection of the output from spray dryers, crushers, pulverizers and other manufacturing equipment.

180-tube Multiclone Capacity 72,500 c.f.m.

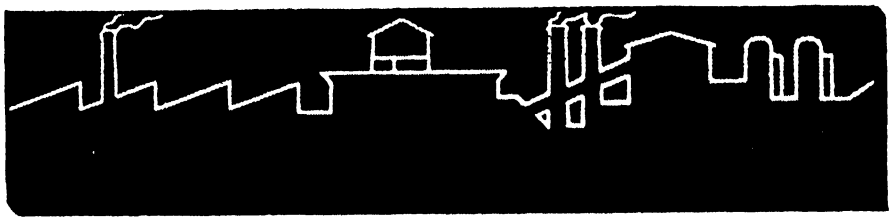
New Fuse Unit

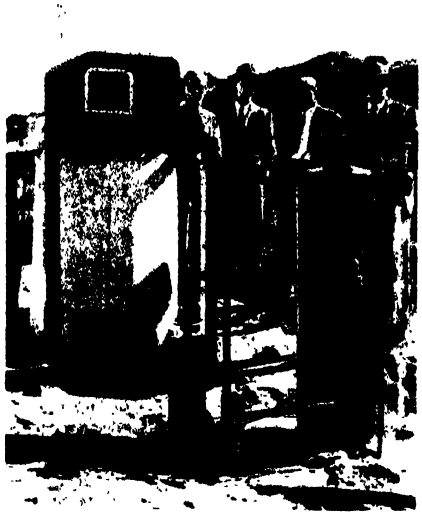


A NEW convenience for changing fuses in close quarters and giving notice on inspection that another spare is required is embodied in a spare fuse holder and puller combined, announced by Littlefuse, Inc., 4797 Ravenswood Ave., Chicago, Ill.

Shellac Substitute

J. EHRLICH, Beverly Hills, Calif., has developed a new phenolic resin that shows promise as a shellac substitute. The resin is of the fusible type but is a glassy solid at room temperature. It yields clear, very concentrated solutions in either alcohol or aqueous caustic soda.

THE Irvington Varnish & Insulator Co., Irvington, N. J., announces its new Fibronized Koroseal Tubing designed for use as electrical insulation by manufacturers in the electronic, instruments, and power industries.



This insulation was developed by Irvington's Fibron Division from B. F. Goodrich Co.'s product, Koroseal.

Synthetic p-Cymene

PRODUCTION of synthetic *p*-cymene (structurally *p*-methylisopropyl benzene) from liquid terpenes is announced by the Hercules Powder Co., Wilmington, Del. A new unit for the production of the material is nearing completion at the Brunswick, Ga., naval stores plant of the company. An important use of *p*-cymene has been as an intermediate in the manufacture of phenols, carvacrol, thymol, and the cyclic alcohol, menthol. The essential oil industry consumes substantial quantities of carvacrol in the manufacture of odorants used in soaps.

Portable Water Purifier

A PORTABLE, automatic unit that produces pure, clear, colorless, tasteless, odorless water without the use of chlorine or other chemicals has been developed by the Technicraft Engineering Co., 5610 South Soto St., Los Angeles, Calif. The unit, known as the Sterozone Model B, has a capacity in excess of 1,200 gallons per hour and can be installed on any tank or water storage container. For field use a 250-gallon canvas bag is used. Power is supplied from 110-volt, 50- to 60-cycle outlet or by a portable gasoline-electric generator. Operation is entirely electrical. No chlorine or other chemicals now restricted for military requirements are needed.

Strip Welder

A LOW-COST installation for welding together ends of strips has recently been developed by the Progressive Welder Co., East Outer Drive, Detroit, Mich. It consists of two air-operated series connected guns for spot welding, a notched bar to locate welds, and a control handle to move the gun along, the entire assembly being supported from an I-beam section above which the welding transformer is located.

Deep-Well Turbine Pumps

PROVIDING the main source of water supply for the $63,000,000 Basic Magnesium reduction plant near Boulder City, Nev., the Peerless Pump Division of the Food Machinery Corp., San Jose, Calif., reports the novel design of 6 high-capacity deep-well turbine pumps.

Each of these pumps, mounted on steel piers extending 200 feet out into Lake Mead, is capable of delivering 3,800 gallons of water per minute, or a combined potential capacity of 32,000,000 gallons daily.

Basic Magnesium, Inc., plans to have the Boulder Dam reduction plant deliver 112,000,000 pounds of metallic magnesium a year. The plan is to mine the ore at Gabbs and Mead, Nev., and truck it about 200 miles to the reduction plant. The plant needs 196,000 kilowatts of cheap power and 9,000,000 gallons of water daily. The power is available only at the Boulder Dam Power House and the only water source in the whole dry area is Lake Mead, formed by the trapped waters of the Colorado River.

The selection of these pumps follows the installation of 30 giant Peerless Hydro-Foil propeller-type pumps by the Dow Chemical Co. in the magnesium plant at Houston, Tex. These huge pumps individually deliver up to 100,000 gallons per minute against heads of up to 60 feet and are being used in extracting magnesium from sea water. This was the process that earned Dow the 1941 Chemical Award for the outstanding achievement of the year.

Vibrex Vibrating Screens

THE Style M Robins-Vibrex, a high-speed, unbalanced pulley type vibrating screen that will stand up to overloads, is announced by the Robins Conveying Belt Co., Passaic, N. J.

The new screen has a number of features designed to save power, lubricant, screen cloth, and general maintenance costs. Oil-lubricated bearings are supersealed by means of double-action flingers and completely welded splash and dust guards. Inclination of screen, amplitude of vibration, and operating speed may all be varied in order to obtain maximum flexibility of application.

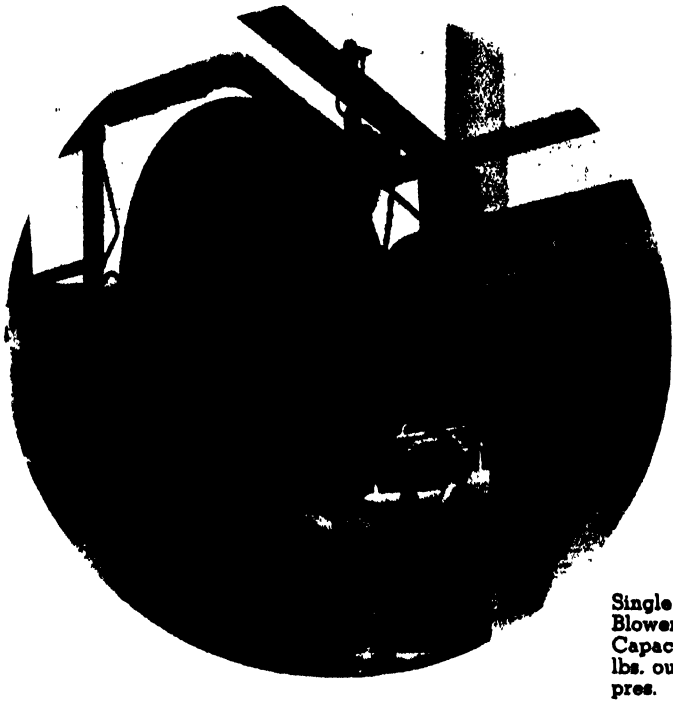
Low-Visibility Paint

A NEW type of low visibility paint, possessing exceptional heat-deflecting qualities, has been developed by The Arco Co., Cleveland, Ohio, for use in the protective concealment of vital defense structures

WATER
FOR A NATION AT WAR!

To the East and to the West, we are looking straight into the cannons of war. From within we face the inevitable saboteur. It is time to become grim, cautious and determined in our war aims and actions. We must win this war and do a good job of it. We will fight with men, metals, fuel, power, food, water and materials of all kinds.

Never before has water been a more vital necessity. Beyond its task of serving men, materials and machines, water now also must guard against fire . . . protect factories, equipment, supplies, homes . . . and lives.



As in the strenuous days of defense preparation, Layne now is ready, fully equipped and speedily engaged in an even greater task . . . that of providing water for a Nation at war. This activity includes service to the Military and Naval forces, essential industries and necessary repair work.

Check your water supply and install necessary wells and pumps. See that all present wells and mechanical equipment are placed in good order and kept ready for any emergency. Repairs to existing equipment will conserve material needed for war purposes.

Single stage Centrifugal Blower in Eastern refinery. Capacity, 11,750 CFM, 3 lbs. outlet pres., 14.3 inlet pres.

BLOWER DESIGN *TO MEET YOUR REQUIREMENTS*

If your air or gas handling problem is constant pressure with variable volumes, a Roots-Connersville Centrifugal Blower, with motor drive, may be the answer.

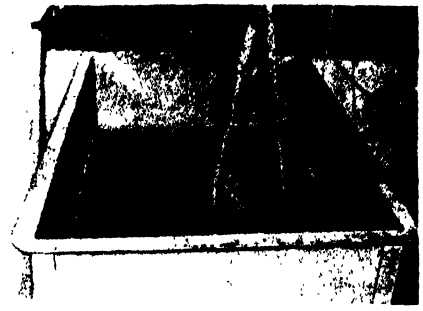
But what about specific service conditions? They may be corrosive gases, high temperatures, space limitations, adaptations to other equipment, etc. These factors call for specialized knowledge and experience to build a blower to suit your requirements.

That's where Roots-Connersville can step in and assume the burden. Hundreds of successful installations are proof of our ability to help you. Write us about your needs.

ALL OUT for VICTORY

Roots CONNERSVILLE SINCE 1854 Centrifugal

BLOWERS · EXHAUSTERS

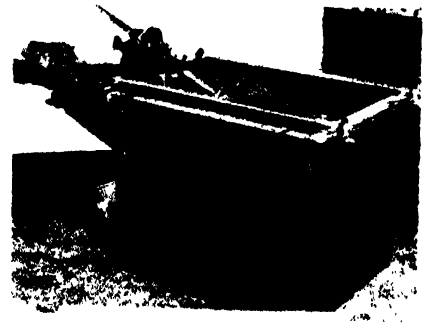


Single stage "R-C" units handle pressures up to 3 lbs. Multi-stage units up to 30 lbs. Capacities from 100 to 50,000 CFM.

ROOTS-CONNERSVILLE BLOWER CORPORATION

202 Georgia Avenue — Connersville, Indiana

and equipment. Already in use on certain government properties, the new paint meets tentative Navy specifications for infrared reflecting paints for use on fuel storage tanks, buildings, and certain types of equipment where dark colors as well as heat-reflecting qualities are required. It is offered commercially under the trade name "Infray" and is being manufactured in green, tan, black, and four intermediate shades.



Substitute for Trichloroethylene Degreasing

ANNOUNCEMENT is made of a new mineral grease and dirt digestive solvent, called Gunk X-11, available from the Curran Corp., Malden, Mass. This is available in the form of a concentrate which may be diluted with a grease solvent before use to charge large open cleaning tanks or vats. The newly developed digestive solvent tank is a substitute for trichloroethylene vapor-phase metal-cleaning tanks, particularly in heavy-duty automotive or similar applications where there is much insoluble dirt or smut to be removed.

The cleaning is carried out by cold immersion of greasy or dirty parts. The new solvent not only takes the cling out of hard mineral dirt and grease accretion, but emulsifies them so that they may be instantly and completely rinsed away by sluicing with a water hose.

Motor-Driven Oblique Plating Barrel

AN IMPROVED oblique plating barrel drive has been developed by the Hanson-Van Winkle-Munning Co., Matawan, N. J. This Type 34 oblique barrel is available in a new model, directly driven by a 1/6 hp. motorized worm-gear reducer which is suitably mounted on the tank, ready for connection to power lines. The arrangement readily permits the removal of the cylinder for rinsing, loading, and unloading of the work.

CHEMICAL MARKET PRICES

January 30, 1942

Compiled from weekly current price listings in the *Oil, Paint and Drug Reporter*, with permission of the publisher under its copyright. These prices, unless otherwise specified, are those prevailing in the New York market for technical grades in usual large commercial quantities.

Bromide, U. S. P., bbls.	lb.	.27
Chlorate, cryst., bags	lb.	.06¼
Chloride, bags	ton	15.70
Cyanide, 96-98%, dom., drums.	lb.	.14
Fluoride, white, 90%, bbls., c/l., frt. alld.	lb.	.08
Metallic, untrimmed bricks, drums, f. o. b. Niagara Falls	lb.	.15½
Metasilicate, gran., bbls.	100 lbs.	2.50
Naphthionate, bbls.	lb.	.50
Nitrate, crude, bulk	ton	27.00
Nitrite, bbls.	lb.	.06¾
Perborate, bbls.	lb.	.14¾
Phosphate, disodium, cryst., bags, c/l., wks.	100 lbs.	2.55
Phosphate, trisodium, bags, c/l., wks.	100 lbs.	2.70
Picramate, kegs	lb.	.65
Prussiate, yellow, bbls.	lb.	.11
Silicate, drums, c/l., 40°	100 lbs.	.80
Silicofluoride, dom., bbls.	lb.	.12
Stannate, drums	lb.	.33½
Sulfate, anhyd., bags	100 lbs.	1.70
Sulfide, cryst., bbls.	100 lbs.	2.40
Solid, 60%	100 lbs.	3.15
Sulfocyanide, C. P., bbls.	lb.	.55
Thiosulfate, reg., cryst., bgs.	100 lbs.	2.25
Tungstate, tech., kegs	lb.	No prices
Strontium carbonate, tech., bbls.	lb.	.15*
Nitrate, bbls.	lb.	.07¾
Sulfur, bulk, mines	ton	16.00
Chloride, drums	lb.	.03
Dioxide, commercial, cyl., wks.	lb.	.07
Tetrachloroethane, 50-gal. drums.	lb.	.08
Thiocarbanilid, bbls.	lb.	.24
Tin, Straits	lb.	.52
Crystals, bbls.	lb.	.39
Oxide, bbls.	lb	.55
Tetrachloride, anhydrous, drums, bbls.	lb.	No prices
Titanium dioxide, bags	lb.	.14¼
Toluene, tanks	gal.	.28
Triamylamine, l. c. l., wks.	lb.	.90
Triamylborate, drums, l. c. l., wks.	lb.	.33
Tributylamine, drums, l. c. l., wks.	lb.	.70
Trichloroethylene, drums, wks., frt. allowed	lb.	.08
Tricresyl phosphate, tech., drums.	lb.	.25
Triethanolamine, drums, c/l., wks.	lb.	.19
Triphenyl phosphate, drums	lb.	.88
Tungsten, tech., powder	lb.	2.60
Urea, dom., 46 + % N., bags, f. o. b. wks. or seaboard	ton	80.00
Vanillin, 25-lb. tins	lb.	2.35
Whiting, comm., dry-grd., bags, c/l., wks.	ton	18.00
Xylene, 10°, tanks	gal.	.30
Xylidine, drums	lb.	.35
Zinc ammonium chloride, bbls.	lb.	.0565
Chloride, tech., fused, drums	lb.	.05
Dust, bbls., c/l.	lb.	.1035
Metal slabs, at N. Y.	lb.	.0865
Oxide, Amer., bags	lb.	.0725
Stearate, tech., bbls.	lb.	.30
Sulfate, cryst., bgs., c/l., wks.	100 lbs.	3.40

* Nominal.

EMPLOYMENT INFORMATION

RATES to be paid in advance. Standard setting 5c a word, minimum charge $2.00 each; include 8 words for box address. Exceptions see ⟶ Display, $7.50 per column inch. No discounts or allowances.

SEND advertisements with remittance to INDUSTRIAL AND ENGINEERING CHEMISTRY, 332 West 42nd St., New York, N. Y., to reach there not later than 10:00 A.M. on the 10th and 25th, closing dates for NEWS EDITIONS of the 25th and 10th, respectively. Insertions made in order of receipt provided necessary remittances are complete.

Employers are requested to mention in their announcements the section of the country in which the open position is located to ensure replies only from those who are geographically available.

In printing these advertisements the SOCIETY assumes no obligations as to qualifications of prospective employees or responsibility of employers.

Unemployed members of the AMERICAN CHEMICAL SOCIETY seeking employment for themselves are allowed in one calendar year 3 free announcements, one per issue, set in standard style and limited to 50 words each, including 8-word box address. Excess words 5c each. Additional standard announcements 50% of regular rate.

Employed members of the AMERICAN CHEMICAL SOCIETY seeking new positions are permitted 3 standard announcements during the calendar year at 50% of the regular rate—include 8 words for box address.

Employers seeking chemists and chemical engineers are permitted 3 standard announcements, not to exceed 50 words each including box address and not more than one per issue, during the calendar year without charge, provided they agree in writing to acknowledge all replies (excess words 5c each), otherwise full rate applies.

The AMERICAN CHEMICAL SOCIETY is vitally interested in the welfare of its members and in seeing that the chemical industry is manned with competent chemists and chemical engineers. These pages are part of our service in that connection. In addition most of the larger sections of the AMERICAN CHEMICAL SOCIETY and several of the smaller ones have active employment committees. Local section secretaries in your area will inform you as to any employment aids that may be available locally.

An Employment Clearinghouse is operated at each national meeting of the SOCIETY for the purpose of bringing together representatives of industry looking for chemists and members and student affiliates in attendance wishing to make such contacts. For further details, consult the preliminary and final programs as printed in the NEWS EDITION prior to each meeting.

In the New York area, special employment facilities are offered by the Employment Bureau of the Chemists' Club, 52 East 41st St., New York, N. Y., and by the Chemist Advisory Council, Inc., 60 East 42nd St., New York, N. Y. In the Chicago area, the Chicago Section maintains an employment service at 413 Stevens Hotel, Chicago, Ill.

Those replying to announcements should be careful to send copies and not original documents. Advertising circulars will not be forwarded and to that end all letters will be opened at the forwarding office.

SITUATIONS OPEN

Those announcements in which the letter "P" is part of the address key have paid in full and are not committed to acknowledge replies. The Society regards acknowledgment by employers of all applications as an act of common courtesy but can assume no responsibility for their failure to do so.

EXECUTIVES, CHEMICAL ENGINEERS AND CHEMISTS with exceptional backgrounds of experience should use our confidential and individual method of contacting responsible employers. No limit to territory. We negotiate all overtures. Established 1915. The National Business Bourse, 20 W. Jackson Blvd., Chicago, Ill.

ORGANIC RESEARCH chemist, Ph.D., under 30, with wide experience in synthetic organic chemistry for development of research department in large mid-west industry. Submit full details of education, experience and complete personal data. Include salary expected and recent photo.
Box 14-N-1, Ind. & Eng. Chem., Easton, Pa.

WANTED BY large Eastern concern for immediate employment; Chemists or chemical engineers for research and development work in petroleum and polymer chemistry. Our own employees have been advised of this advertisement. Replies will be treated in strictest confidence. Submit photograph with details of experience and qualification.
Box 22-N-1, Ind. & Eng. Chem., Easton, Pa.

RESEARCH CHEMIST wanted with actual working knowledge of formulation and production of synthetic resins, particularly of the phenolic type, to develop new thermo-setting resins from certain natural raw materials.
Box 28-T-1, Ind. & Eng. Chem., Easton, Pa.

GOOD OPPORTUNITY for Chemist experienced in production or research on manufacture X-ray intensifying screens. Give complete details including education, personal history, experience, salary desired, references. Include small recent photograph. Location New York City.
Box 35-T-1, Ind. & Eng. Chem., Easton, Pa.

BIOCHEMIST, Bachelor or Master, must have outstanding scholastic record and good foundation in physical and organic chemistry. Applicants should give educational history, experience, age and other personal data, and recent photo. Excellent opportunity for qualified person in research laboratory of prominent food organization.
Box 10-NP-2, Ind. & Eng. Chem., Easton, Pa.

GRADUATE ASSISTANTSHIPS at the University of Maine. Applicants may work half time toward the master's degree in chemistry or chemical engineering. Remuneration $500 plus tuition for twelve hours' laboratory instruction per week for the school year. Applicants should be in the upper quarter of graduating class. All applications must be received before March 15 and should include complete personal data, photograph, official transcript, preferred research field and three reference letters.
Box 11-N-2, Ind. & Eng. Chem., Easton, Pa.

WANTED for RESEARCH and development department of large chemical manufacturer in Western New York area two (2) Junior Chemical Engineers. Must have thorough training in chemistry and chemical engineering. Two or three years' experience an advantage but not required. Give full details of education, experience, personal data, and salary required.
Box 14-N-2, Ind. & Eng. Chem., Easton, Pa.

RESEARCH CHEMIST with broad training in the food industry. Good foundation in physical and organic chemistry necessary. Applicants should give educational history, scholastic grades, experience, age and other personal data, and recent photo. Excellent opportunity for qualified person.
Box 15-NP-2, Ind. & Eng. Chem., Easton, Pa.

CEREAL CHEMIST. Experience in cereal laboratory for research and product development. Location East. Submit full details of education, experience, salary desired and photograph.
Box 16-N-2, Ind. & Eng. Chem., Easton, Pa.

CHEMISTS and CHEMICAL engineers for research allied to and control of a new ammonia plant and other defense projects. Although positions are classified as temporary, they offer definite probability of permanent employment.
Box 17-N-2, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST of Bachelor, Master, or Ph.D. grades. Good record in the fundamental branches of chemistry required. Applicants should give educational history, experience, age, and recent photo. Opportunity for qualified person in research laboratory of prominent food organisation.
Box 23-NP-2, Ind. & Eng. Chem., Easton, Pa.

WOMAN CHEMIST, recent graduate, wanted by mid-west manufacturer to assist in abstracting and bibliographic work. Typing ability helpful. Reply giving full details on education, personal data and references.
Box 25-N-2, Ind. & Eng. Chem., Easton, Pa.

ANALYTICAL CHEMIST. With advanced degree and 3 years' experience in biochemical field. Experience with tobacco analysis highly desirable but not essential. Give personal data, qualifications, salary expected and enclose photograph in first letter.
Box 30-N-2, Ind. & Eng. Chem., Easton, Pa.

CEREAL CHEMIST Preferably with two or three years' experience. Applicants should give educational history, scholastic grades, experience, age, and recent photo. Excellent opportunity for qualified person in research laboratory of prominent food organization.
Box 31-NP-2, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER for operating and engineering duties, with ability to handle drafting, design layout, pilot plant development and plant operations. Permanent position with lignin products division of reliable firm located Central Wisconsin. Married man with some industrial experience preferred. Reply giving personal data, training, experience, salary expected, draft status, and enclosing photograph.
Box 32-NP-2, Ind. & Eng. Chem., Easton, Pa.

CHEMIST for control laboratory. Must be graduate and under 30 years of age. Preference given to married man with some chemical engineering or bacteriological training. Will consider recent graduate. Ohio location. Please send full personal information and recent snapshot.
Box 33-NP-2, Ind. & Eng. Chem., Easton, Pa.

(Continued on page 230)

WANTED

BY DESIGNERS AND BUILDERS OF PROCESS INDUSTRY PLANTS FOR HIGHLY IMPORTANT DEFENSE WORK

PIPING DESIGNERS AND DRAFTSMEN

Experienced in the layout and detailing of piping for oil refinery units, processing plants, or chemical plants.

STRUCTURAL DESIGNERS AND DRAFTSMEN

Experienced in design and detailing of steel structures, foundation and concrete work, and industrial buildings.

PROCESS EQUIPMENT DESIGNERS AND DRAFTSMEN

Experienced in design of pressure vessels, fractionating columns, heat transfer equipment, and the like.

ELECTRICAL ENGINEERS

Experienced in electrical layout for process plants. Must know explosion proof work.

INSTRUMENT ENGINEERS

Experienced in instrumentation and control of process plants.

SPECIFICATION WRITERS

Experienced in preparation of specifications for purchase and preparation of bills of material for process plant construction work. Excellent opportunities for the right men.

Write outlining qualifications and experience. Personal interviews will be arranged when desirable.

BLAW-KNOX COMPANY
PROCESS INDUSTRIES DEPT.
PITTSBURGH, PA.

Address communications to the box number indicated and Mail to Easton, Penna.

The American Chemical Society has no information concerning the position advertised—or in regard to those seeking employment.

(Situations Open Continued)

ANALYTICAL CHEMIST for a food research laboratory. Sound training in the fundamentals of chemistry required. Details of educational history and experience, age, and other personal data, and recent photo should be submitted.
Box 34-NP-2, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, Ph.D. or equivalent, thoroughly trained in organic synthesis. Must be excellent technician. Should have a working knowledge of physical chemistry. In replying give personal data and history. Location Western Connecticut.
Box 44-N-2, Ind. & Eng. Chem., Easton, Pa.

CHEMIST WANTED: To conduct research in the field of Organic Synthesis for progressive mid-west concern. State training, experience, personal qualifications and salary expected. Give references.
Box 46-N-2, Ind. & Eng. Chem., Easton, Pa.

CHEMIST with experience in manufacturing of medicinal and C.P. chemicals. Position with future. State age, experience and salary desired.
Box 47-N-2, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER. Applicants should give educational history, scholastic grades, experience, age and other personal data, and recent photo. Excellent opportunity for qualified person in research laboratory of prominent food organization.
Box 48-NP-2, Ind. & Eng. Chem., Easton, Pa.

CHEMIST or CHEMICAL Engineer. Pilot plant and development work in the organic chemical field. Location—metropolitan New York. Only candidates having five to ten years' responsible experience will be considered. Give full particulars including training, experience, personal data, references, salary expected, and enclose small non-returnable photograph.
Box 50-NP-2, Ind. & Eng. Chem., Easton, Pa.

CEREAL CHEMIST for pilot plant development work on prepared breakfast cereal. Midwestern Research Laboratory. Experience not essential. Prefer recent graduate with some mechanical aptitude and ability to organize work of this type.
Box 55-NP-2, Ind. & Eng. Chem., Easton, Pa.

WANTED IMMEDIATELY: Organic research chemist, at home in vegetable oil field, for position under excellent conditions in well known Eastern research laboratory. Persistence, drive, initiative, ability to plan and cooperate essential. Advanced degree preferred. Opportunity of life-time for properly qualified person.
Box 62-NP-2, Ind. & Eng. Chem , Easton, Pa.

PLASTICS CHEMIST for development work on by-products. Must be free to travel for prolonged periods. Send full data regarding education, experience, salary desired and small photo.
Box 67-NP-2, Ind. & Eng. Chem., Easton, Pa.

LIBRARY ASSISTANT (Female) B.S. or M.S. Experienced in classifying and cataloging technical publications, abstracting, and literature searching. Must have outstanding scholastic record, literary ability and good foundation in chemistry or biology. Applicants should give educational history, experience, age, and other personal data and recent photograph. Excellent opportunity for qualified person in library of a prominent food organization. Location near New York City.
Box 71-NP-2, Ind. & Eng. Chem., Easton, Pa.

BIOCHEMIST in FOOD Research Laboratory. Broad training in the fundamental branches of chemistry necessary and demonstrated ability to apply training. Please provide details of education, scholastic attainments, experience, age and a photograph.
Box 72-NP-2, Ind. & Eng. Chem., Easton, Pa.

CHEMIST or CHEMICAL engineer wanted by Eastern concern. Relatively new graduate preferred. One or two years' experience in paint and varnish formulation and testing desired but not essential. Give educational training, experience, salary desired and recent photograph.
Box 73-N-2, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER for sales promotion of industrial instrumentation in process industries. Sound technical training and several years process experience essential. Send photo and complete record with first letter. The Foxboro Company, Foxboro, Mass.

CHEMIST or ENGINEER for research and development work on insulation board and kindred products. Applicant should have 3 to 5 years' experience with research problems of this or similar nature and should be familiar with stock preparation and manufacture of high and low density boards. Location middle west. Give full details of background, training, experience and salary desired in first letter and include photograph. Our staff has been advised of this advertisement.
Box 82-N-2, Ind. & Eng. Chem., Easton, Pa.

ANALYTICAL CHEMIST, woman, Northeastern State. Some previous experience required. State age, experience, religion, salary required, give references and include snapshot.
Box 84-NP-2, Ind. & Eng. Chem., Easton, Pa.

CHEMIST or CHEMICAL engineer wanted by rayon manufacturer for research work. Thorough training in organic chemistry preferable, plant experience not necessary. Woman, or man with deferred draft classification. Not over thirty five years. Give summary of education, experience, personal data, salary required. References and recent photograph. Location Southeast.
Box 87-NP-2, Ind. & Eng. Chem., Easton, Pa.

DIRECTOR, DEVELOPMENT and research program, pharmaceutical field, thoroughly trained organic chemist with working knowledge biochemistry and bacteriology, to $10,000: Perfume chemist, to $300: Chief control chemist to $400: Control chemists (4) to $300: Pharmacy science bachelor for manufacturing, $40. All positions in East. Everett Brown Agency, 17 John Street, New York.

January 10, page 36

CHEMIST, BIOCHEMIST, bacteriologist. A.B., 16 years' experience in foods, biological and bacteriological products, plant management including production, maintenance, personnel, and accounting. Successful research and sales records. Patent experience. Age 39, married, Protestant. Continental U. S. preferred.
Box 66-T-10, Ind. & Eng. Chem., Easton, Pa.

FOOD CHEMIST with over twenty years wide experience in the food industry, in direction, research, process development, quality control, and factory problems. Desires a responsible position.
Box 48-T-11, Ind. & Eng. Chem., Easton, Pa.

PROFESSORSHIP Ph.D., Phi Beta Kappa, listed in Who's Who, Protestant. Experienced in teaching General, Organic, and Industrial Chemistry, also as industrial research laboratory director. Now employed, but interested in return to teaching because of opportunity for essential constructive work.
Box 31-N-1, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, ORGANIC, Ph.D. in 1942 from Eastern University. Available immediately. Research in ensyme chemistry and analytical organic. Publications. Broad background in major field including synthetic organic. Minor in physical and biochemistry. 4 years' experience in teaching organic and inorganic. Eastern location preferred but not essential.
Box 36-N-1, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST Chemical Engineer: A.B., M.A., 3½ years' towards Ph.D. (evenings). 5 years' experience industrial research, principally in organic chemical lines, cosmetics, and pharmaceuticals. Wants position in production or research with good chance for advancement. Draft deferred. Available immediately.
Box 37-N-1, Ind. & Eng. Chem., Easton, Pa.

COLLEGE TEACHING or research, Ph.D., 1940. Organic major. Two years' college teaching, general, organic, analytical; two years' graduate assistant. Phi Beta Kappa, Sigma Xi, fellowships, publications. Available June, 1942. Woman, single.
Box 21-T-1, Ind. & Eng. Chem., Easton, Pa.

ORGANIC BIOCHEMIST, Ph.D., 1942 Available March 1. Experience in vitamin D and sterol research, including spectrophotometric and chromatographic technique. Interested in vitamin, ensyme, or drug research. East preferred. Age 26, single, draft deferred. Protestant. Member of Phi Lambda Upsilon, Sigma Xi. Publication.
Box 24-T-1, Ind. & Eng. Chem., Easton, Pa.

SYNTHETIC ORGANIC Chemist. M.S. leading university. Additional graduate research. Young, responsible, good personality. Draft deferred. Excellent organic training. Industrial experience. Desires organic research position in a metropolitan area. Presently employed.
Box 12-N-2, Ind. & Eng. Chem., Easton, Pa.

BIOCHEMIST, Sc.D., married; 12 years' experience in research and research direction, specializing in vitamins; 20 publications. Broad biological background. Desires responsible position in research or research and development.
Box 13-N-2, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, excellent background. 8 years' varied chemical experience. Age 27. Research publications in physical, organic, and biochemistry. M.S. physical and organic. Phi Lambda Upsilon. Year chemistry teaching. Industrial testing and control experience. Employed. Out of town offers invited.
Box 18-N-2, Ind. & Eng. Chem., Easton, Pa.

PHYSICAL and INORGANIC Chemist, Ph.D., 1939. Single, 28, dependents, draft deferred. 6 years' college teaching, directing research, publications in x-ray crystal analysis, honor societies, thorough training in major fields. Desires research in metallurgy, spectroscopy, college teaching. Prefers Middle West, East. Available June, 1942.
Box 20-N-2, Ind. & Eng. Chem , Easton, Pa.

BIOCHEMIST, M.S., 1938 desires research position. Thoroughly experienced in small animal experimentation and vitamin assays of pharmaceuticals and food preparations. Development work on pharmaceuticals and control assay methods. Director of biological laboratory with three years research on vitamin preparations and pharmaceuticals. Married, 3A draft deferred.
Box 22-N-2, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, age 39, Ph.D. 1928, with 14 years' research experience in carbohydrates, pharmaceuticals, hydrocarbons. Fluent in German, French, Russian; abstractor for Chem. Abstr. Research position in pharmaceutical or synthetic rubber industry desired.
Box 24-N-2, Ind. & Eng. Chem., Easton, Pa.

WOMAN CHEMIST, M.S. '38. Organic and colloid chemistry. Desires position in development or research department. Over 2 years' experience in research and non-routine analysis on industrial organic materials. Location mid-west. Member Sigma Xi.
Box 27-N-2, Ind. & Eng. Chem., Easton, Pa.

RUBBER CHEMIST, Chemical Engineer. B.S. in Chemical Engineering 1938. Dean's list man. 40 months rubber experience as production and laboratory supervisor. Position wanted in synthetic rubber development. Single, age 28, immediately available for eastern location.
Box 28-N-2, Ind. & Eng. Chem., Easton, Pa.

(Continued on page 231)

(Situations Wanted Continued)

PHYSICAL CHEMIST, Ph.D., specializing in Surface Chemistry (Adsorption, Catalysts, Corrosion). Desires research and development or teaching position.
Box 29-N-2, Ind. & Eng. Chem., Easton, Pa.

POST GRADUATE Chemist, 43, 17 years' petroleum refining experience mostly as Chief Chemist of major oil company. Desires position with reliable company as chemist, superintendent or any position of real responsibility.
Box 35-N-2, Ind. & Eng. Chem., Easton, Pa.

EXPLOSIVES CHEMIST 1½ years' dynamite plant; analysis, testing of powder, mixed acid, and nitroglycerin. Explosives laboratory; some plant operation. Now employed, but desire ordnance plant with opportunity. Powder control and development. Publication inorganic analysis. Cal Tech. 2-B deferment, 23, single. Anywhere.
Box 37-N-2, Ind. & Eng. Chem., Easton, Pa.

COLLEGE TEACHING or Research, Ph.D., 1931, with teaching experience in general, organic, physical chemistry, research work in colloids, publications, Protestant, midwest preferred, age 37, American, draft deferred.
Box 40-N-2, Ind. & Eng. Chem., Easton, Pa.

PHYSICAL CHEMIST, Ph.D. large, eastern university. Two years' full-time teaching physical chemistry in small ACS accredited college. Desires teaching position with better research facilities. Interest—kinetics of organic reactions. Publications, honor societies. Protestant, married, age 27. Available in May.
Box 41-N-2, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER, D. Eng., 13 years' experience in plant research, development and control including construction, installation, maintenance, operation in the oil refining industry, age 38, married. Desires new connection where his abilities can be utilised fully.
Box 49-N-2, Ind. & Eng. Chem., Easton, Pa.

ORGANIC Ph.D. June 1942, desires patent service or chemical sales position. Location immaterial. Age 25, single, aggressive, personable, ambitious. Some industrial experience in petroleum products, tin derivatives; part-time sales, teaching; carbohydrate research. Enjoys traveling, contacting people.
Box 51-N-2, Ind. & Eng. Chem., Easton, Pa.

BIOCHEMIST Ph.D. 1941 with 3 years' experience in fermentation work. Also 1 year of experience in industrial research on vitamins. Member of Phi Kappa Phi, Sigma Xi, Phi Lambda Upsilon. Age 28, married, Protestant. Desires research position in fermentation work. Location immaterial.
Box 54-N-2, Ind. & Eng. Chem., Easton, Pa.

Ph.D. June '42. Available for employment June. Excellent training in Organic and Physical Chemistry. Married, draft classification 3A. Interested in firms engaged in petroleum, rubber, or plastics.
Box 56-N-2, Ind. & Eng. Chem., Easton, Pa.

CHEMIST and CHEMICAL engineer with exceptional training, experience and executive ability; highly successful record of accomplishment in responsible positions; sound judgment; resourcefulness; good personality. Seeks outstanding position in chemical research, development or management.
Box 58-N-2, Ind. & Eng. Chem., Easton, Pa.

HIGHLY SUCCESSFUL, capable and experienced university teacher; chemist of wide experience and accomplishment in executive positions; Ph.D., best of training here and abroad; numerous publications. Interested in university professorship in general, physical, industrial chemistry or chemical engineering.
Box 59-N-2, Ind. & Eng. Chem., Easton, Pa.

BLACKOUT CHEMIST: phosphorescent products for emergency lighting, indicators, directions, signals. Background of physical chemistry and industrial experience. Interested and experienced in manufacture and development of these materials. Married, children.
Box 60-N-2, Ind. & Eng. Chem., Easton, Pa.

SPECTROGRAPHER CHEMIST, M.S. accredited college. Two years' industrial experience in spectrographic, radiographic, and X-ray diffraction analysis. Desires research analytical position employing these techniques. Preferably in East or Middle East. Married, 26.
Box 63-N-2, Ind. & Eng. Chem., Easton, Pa.

DEVELOPMENT and RESEARCH chemist, Ph.D., chemical engineer, 14 years' successful direction in fermentations, cereal chemistry, biochemistry, yeast, foods. Careful worker, adaptable, invention minded, publications, patents, office experience, four languages, excellent credentials. Interested in responsible position or good opportunity for advancement.
Box 65-N-2, Ind. & Eng. Chem., Easton, Pa.

SYNTHETIC RESIN Chemist. Five years' experience in technical research on synthetic coatings and adhesives. Also experienced in photochemistry. I have shown originality; and I have obtained practical results. Married. Age, 28. Harvard training. Now employed, seeking better opportunity.
Box 68-N-2, Ind. & Eng. Chem., Easton, Pa.

RUBBER CHEMIST now employed, 4 years' experience in compounding development, and processing of mechanical goods and sponge, reclaimed and synthetic rubbers, also latex, water dispersions and adhesives.
Box 69-N-2, Ind. & Eng. Chem., Easton, Pa.

PRODUCTION CHEMIST. Graduate chemical engineer with twenty years' experience in heavy chemicals, acids, purified cellulose fibre, nitrocellulose, viscose-cellulose film, paper coatings, lacquer formulation. Positions held: chief chemist, development engineer, production department head, plant superintendent. Primary interest: production supervision.
Box 74-N-2, Ind. & Eng. Chem., Easton, Pa.

POSITION TEACHING general or physical chemistry desired by Ph.D. from large midwestern university having one year post-doctoral research experience, three years' experience teaching general chemistry. Age 27, married, selective service classification 3A. Sigma Xi, Phi Kappa Phi, Phi Lambda Upsilon. Opportunity for research is essential. Available June 1942.
Box 78-N-2, Ind. & Eng. Chem., Easton, Pa.

WANTED: work that contributes to "all out" emergency effort. 1940 Ph.D. Physical Chemistry major, Organic and Physics minors. Almost thirty months industrial experience in applied inorganic research and process development. Teaching experience. Selling experience in unrelated field. Cooperative and adaptable. Member of several honor societies. Married. Age 34. Protestant. Class 3 draft. Now employed. Available on reasonable notice.
Box 79-N-2, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER, 13 years' experience in pigment manufacturing and wet metallurgical processes. Research and manufacture of lithopone, zinc pigments, titanium dioxide, barytes reduction, zinc liquor purification. Electrolytic manganese. Pilot plant operation. Available now.
Box 80-N-2, Ind. & Eng. Chem., Easton, Pa.

ANALYTICAL CHEMIST M.Sc. 1940 with one year experience in control work desires position in Spectrographic field. Currently completing Defense Training course in Applied Spectroscopy. Also interested in Control position in Defense Industry. Eastern location preferable.
Box 86 N-2, Ind. & Eng Chem., Easton, Pa.

SITUATIONS WANTED
(NONMEMBERS)

YOUNG WOMAN (B.A.) June 1941, majored in Chemistry-Biology-Bacteriology. Excellent typist-stenographer. Knowledge of French and German. Prefers office position.
Box 26-N-2, Ind. & Eng. Chem., Easton, Pa.

B.S. in CHEMISTRY 1940, University of Pittsburgh. Courses included qualitative and quantitative analysis, advanced organic, physical, steel analysis, fuel analysis, biochemistry. Also EDTC, Testing of Explosives. Draft status, 1-B.
Box 38-N-2, Ind. & Eng. Chem., Easton, Pa.

CHEMIST I.Ph. University Vienna, age 37, draft deferred, single, 11 years' practical experience asphalt, tar distillation, bituminous emulsions, paints, varnishes, portland cement, desires position.
Box 39-N-2, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, A.B. Degree in June. 42 hours of chemistry. Desire work in plastics or synthetic rubber, Eastern location preferred. Minors: mathematics, physics, German. Age 27, married, Christian. Good character references. Mechanically inclined.
Box 42-N-2, Ind. & Eng. Chem., Easton, Pa.

PHARMACEUTICAL CHEMIST, age 37, married, B.S. Pharm., M.S. Chem. and Ph.D. requirements. 3 years' control, 5 years' diversified research, and 3 years' production. Desires position having future with progressive pharmaceutical manufacturer. Employed now.
Box 45-N-2, Ind. & Eng. Chem., Easton, Pa.

PHYSICIST. Background in electron physics, mathematics, physical chemistry, mechanical engineering. Scholarship recipient seven years. Three years experience in college teaching, industrial inspection and testing, government research and development. Age 25, draft 3A. Now available.
Box 61-N-2, Ind. & Eng. Chem., Easton, Pa.

ASSISTANT PHARMACOLOGIST & Chemist, B.S., graduate courses in chemistry. Male, 33, class 3A. Working for past 6 years in Department of Pharmacology of medical school in N. Y. C. Bio-assays, pharmacological, physiological experimental set-ups, bio-chemistry.
Box 66-N-2, Ind. & Eng. Chem., Easton, Pa.

EXPERIENCED MECHANICAL Engineer, licensed, with creative ability, expert in high temperature heat distribution for presses, evaporators, etc., and all thermodynamic questions including power problems, possesses chemical knowledge, seeks position as production or development engineer for improving processes or designing new equipment in petroleum, plastic, rubber, paper or other industries.
Box 81-N-2, Ind. & Eng. Chem., Easton, Pa.

BIOCHEMIST, Mem. Amer. Soc. Biol. Chem., Ph.D., 10 years' research experience, numerous publications, presently at great Eastern university with rank of assistant professor, desires position offering adequate scope and opportunities. Research has dealt with chemistry of enzymes and vitamins, biophysics of proteins and viruses, cellular metabolism. Expert knowledge of ultracentrifugal and electrophoretic techniques. Age 37, married. Best references.
Box 89-N-2, Ind. & Eng. Chem., Easton, Pa.

A. C. S. EMPLOYMENT CLEARING HOUSE MEMPHIS MUNICIPAL AUDITORIUM APRIL 19–24, 1942

Open only to members and paid student affiliates registered at the meeting.

See Page 36, January 10 issue of this publication.

Fork Truck

THE Clark Tructractor Division of the Clark Equipment Co., Battle Creek, Mich., has developed a sturdy, low-priced, compact, fork-type truck that incorporates all desirable features in modern truck design. Christened the "Clipper", these trucks are offered in six models, capacities 1,000, 1,500, 2,000 pounds with standard finger lifting heights of 60 to 108 inches, other special heights optional.

The Clipper has an economical four-cylinder industrial truck engine, front wheel drive, rear wheel steer, hydraulic lift and tilt. Self-starter and hydraulic brakes are standard equipment.

Bakelite Corp. Opens Cincinnati Sales Office

THE Bakelite Corp., unit of Union Carbide and Carbon Corp., has established a new sales office for Bakelite varnish resins at Cincinnati, Ohio. The new office, which will be under the direction of Robert B. Waters, is located at 2506 May St.

MISCELLANEOUS

BUSINESS OPPORTUNITIES • FOR SALE • WANTED • ETC.

Five cents a word, minimum charge $2.00; display available at $7.50 per inch; in advance. No discounts or allowances

MICRO-ELEMENTARY ANALYSES: C, H, N, S, P, Halogens, Methoxyl, Mol. wt., etc., U.S.P. and other official tests, Purity tests, Microinorganic assays, Spot tests, Micro-distillations, Toxicological investigations, and typical micro-chemical research work. Dr. Carl Tiedcke, 366 Fifth Avenue, New York, N. Y.

ASKING for INQUIRIES for manufacturing of fine organic chemicals in limited quantities. Box 85 N 2, Ind. & Eng. Chem., Easton, Pa.

WANTED to BUY: New or used single Vols 2, 3, 5 and 6 of Ullmann Enzyklopaedie der technischen Chemie second edition. Also looking for new or used complete set of Ullmann Enzyklopaedie der technischen Chemie second edition. Box 21 N 2, Ind. & Eng. Chem., Easton, Pa.

WANTED to BUY: a three to ten pound supply of asbestos for Gooch Crucibles. Box 36 N-2, Ind. and Eng. Chem., Easton, Pa.

Wanted: Physikalische zeitschrift Sowjetunion V. 10, 1936, British Chemical Abstracts, 1936; Journal Societi-Chemical industry London, 1936, and Proceedings 1881 meeting. Box 52-N-2, Ind. & Eng. Chem., Easton, Pa.

WANTED to BUY: manufacturing process for Diphenylamine Offers: Box 70 N 2, Ind. & Eng. Chem., Easton, Pa.

WANTED: "Chemical Abstracts" vol. 1 (1907) nos 12, 15, paying $4 each (nos. 2, 3, 18, 20, Index, $3 each); vol. 2, (1908) nos 1, 2 paying $3 each (nos 7, 10, 21, $2 each). Dr. G. H. Franzius, 201 East 82nd St., New York, N. Y.

MATERIALS WANTED

Regular and steady supply sources wanted for all fine and rare organic chemicals and pharmaceutical specialties. Interested in permanent connections.

Box 77-N-2, Ind. & Eng. Chem., Easton, Pa.

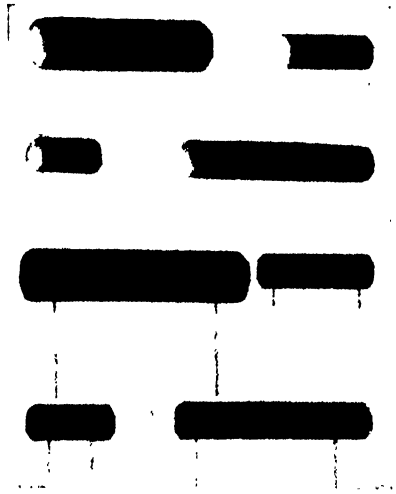
FOR SALE

Semicarbazide Sulfate Purity: Ninety seven per cent minimum Hydrazine Sulfate: Less than 0.6%. Available in 10, 25 and 50 lb. lots.

Box 43-N-2, Ind. & Eng. Chem., Easton, Pa.

WANTED to HELP the Defense Program. Yes, we want to buy your surplus laboratory equipment, instruments and apparatus. Chemists, Metallurgists, Biologists, Physicists and other Scientific workers doing Government work need them badly and in a hurry to use in the months before new equipment deliveries can be made. Look into every corner, closet and storeroom and bring out the hundreds of idle instruments which can be useful to someone else. We are prepared to pay the highest possible price in proportion to value and need. Do not hesitate to offer us your surplus. It will be of great service to the entire chemical field. Cash with all purchases. Write or wire complete listings for immediate attention. Exchanges can be arranged. The Laboratory Exchange, 24 E. 21st St., New York, N. Y.

FOR SALE: Journal American Chemical Society and Chemical Abstracts, 1910–1937 inclusive, excepting 1912, 1913 and 1914 and April and May 1921, including first Abstracts Index. Clean, fresh copies. $200. Box 19 N-2, Ind. & Eng. Chem., Easton, Pa.



FOR SALE: Soc. Chem. Ind. 1904–1911 incl. Ind. & Eng. Chem. Jour. Vols. 1-13 incl. Jour. Amer. Chem. Soc. 1904–1908 incl. Review of Amer. Chem. Researches Vols. 10, 11, 12. The Chemical Engineer Vols. 5, 6, 7, 8 all bound. Box 53 N-2, Ind. & Eng. Chem., Easton, Pa.

FOR SALE: Abderhalden Biochemisches Handlexikon vols. 1 to 9. Abegg Auerbach Handbuch anorganische Chemie vols. 1 to 5. Archiv der Pharmazie 1926 to 1939. Dyer 1933 to 1940. Berichte Deutsche Chemische Gesellschaft 1899 to 1902, 1924, 1935. American Journal tropical Medicine vols. 1 to 17. Box 57-N-2, Ind. & Eng. Chem., Easton, Pa.

FOR SALE: Kilo Histidine Monohydrochloride, Allantoin, Glucuronic Acid, Lobeline, Digitonin, Tryptophane, Leucine, Fucose. Luminous pigments, 1500 lbs. each. Barium and Copper Fluosilicates, 50 lbs. Calcium boride, 300 lbs. Paracresol, 2 tons Antimony metal powder 99%. All salts Caesium and Rubidium in quantity. Box 83 N 2, Ind. & Eng. Chem., Easton, Pa.

FOR SALE: We have available for immediate delivery. Subject to prior sale. International Centrifuges; Horizontal Sterilizing Autoclaves; Barnstead Water Stills; 10 very fine Analytical balances; Becker, Voland and Troemner; 4 Research microscopes; Gaertner Spectrophotometer Assembly; Travis Colloid Mill; Hydraulic Laboratory; Freas and other drying ovens, Incubators, Dubosq Colorimeters, 3 objective Microscopes; Hanovia Ultra Violet Lamp; Gaertner Cathetometer; etc. Write or wire for immediate quotation. The Laboratory Exchange, 24 E. 21st St., New York, N. Y.

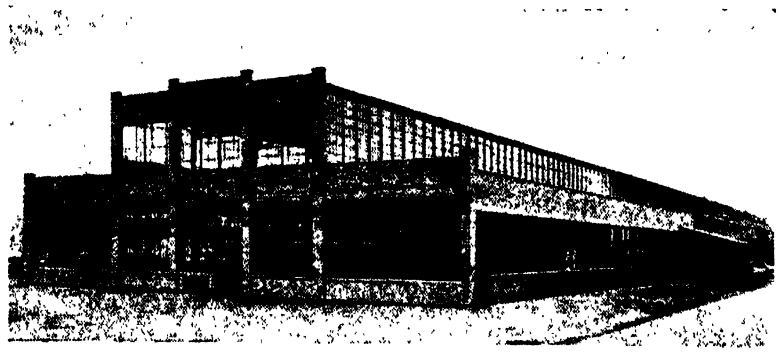
Negative Temperature Coefficient Resistors

THE Keystone Carbon Co., 1935 State St., Saint Marys, Penna., announces that its line of negative temperature coefficient resistors are available with metal-coated ends for making electrical connection. Hitherto, they were supplied only with molded-in wires. The addition of resistors with metal-coated ends has increased the range of application and has simplified design problems by permitting the use of a cartridge or clip method of mounting.

Foam Mixing Chamber

A NEW mixing chamber, the Evertite, has been designed by the American-LaFrance-Foamite Corp., Elmira, N. Y., for easy installation on modern oil-storage tanks of the pressure type. Its purpose is to provide a simple yet effective method of applying a blanket of fire-smothering foam to burning oil surfaces.

THE McKenna Metals Co., Latrobe, Penna., announces a price reduction in Kennametal tools and tool blanks, effective January 5, 1942.



Service for Seamless-Tube Buyers

THE Seamless Steel Tube Institute, Gulf Building, Pittsburgh, Penna., announces the establishment of a new service whereby purchasers may obtain information on the availability of various grades and sizes of seamless steel tubing for new or special wartime requirements.

This step was taken for the benefit of those who have bought tubing for use in peacetime products but who may be unfamiliar with sources of supply for other or special grades of tubing required for war equipment, and for manufacturers who never before needed seamless steel tubing.

Extension to Clark Plant

A 200-FOOT extension to the Clark Bros. Co. plant at Olean, N. Y., has recently been completed to house the manufacture of large triple-expansion marine steam engines, in connection with the Government's defense program.

CHEMICAL AND ENGINEERING NEWS

VOLUME 20 FEBRUARY 25, 1942 NUMBER 4

Educational Institutions of the Memphis Section

THE Memphis Section of the AMERICAN CHEMICAL SOCIETY is fortunate in the number and quality of educational institutions for higher learning in its area.

Situated in the heart of Memphis on a beautiful campus opposite Overton Park is Southwestern, a liberal arts college for men and women. In the eastern end of the city is Memphis State College, primarily a training college for teachers. Near the Tri-State Fairgrounds is the Christian Brothers College, a junior college, and near Crosstown, the central part of the city, is the William R. Moore School of Technology. Close to the principal business section is the University of Tennessee Medical College, adjacent to two large hospitals. Scattered about the city are several smaller colleges of a more specialized nature. In the southern section is Siena College for women. Memphis also has a college for Negroes, LeMoyne College. Situated about two hours' drive from Memphis at Oxford, Miss., is the University of Mississippi.

Southwestern

In 1849 an institution known as Montgomery Masonic College was started by the Masonic Grand Lodge of Tennessee in Clarkesville. But financial difficulties were soon encountered, and the trustees were obliged to find another organization to support it. The Presbyterian Church took it over in 1855 and named it Stewart College after the new president.

The Civil War caused college exercises to be suspended, and occupation by federal troops left the college in ruins, everything being destroyed except the brick walls. The Nashville, Alabama, Memphis, and Mississippi synods which supported separate colleges and suffered similar losses faced a bleak picture after the war. They decided to unite to build one university for the whole Presbyterian territory. These synods pooled their interests and in 1875 selected the remnant of Stewart College to become the nucleus of the newly named Southwestern Presbyterian University. A School of Divinity was added to the university in 1885 but was discontinued in 1917 when the institution became a college.

Soon after Charles E. Diehl became president in 1917, the Board of Directors relocated the college in Memphis. Supplied with stone from their own quarry at Bald Knob, Ark., the new Gothic buildings on the beautiful 124-acre campus were ready for occupancy by 1925. The name was abbreviated to Southwestern. After undergoing many financial difficulties, the college finally emerged in 1930 free from all mortgaged indebtedness with assets of a little over $2,000,000. It is on the approved list of the Southern Association of Colleges and Secondary Schools, American Association of Colleges, and Association

Chemistry and Pharmacy Building, University of Mississippi

of American Universities. Present enrollment is about 500 students.

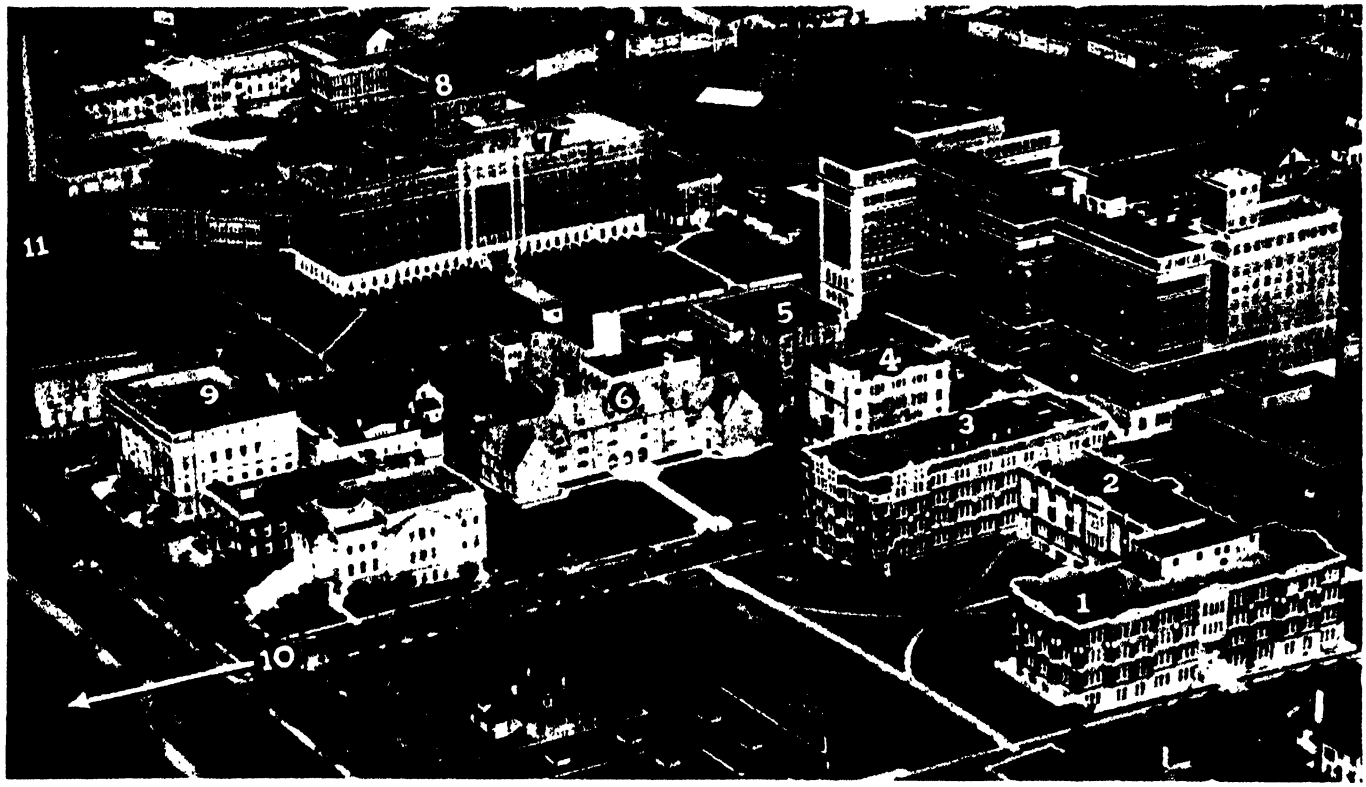
Chemistry, physics, biology, and related subjects are grouped in the Science Building with their well-equipped laboratories and a branch of the library which has more than 48,000 volumes. In the Chemistry Department research on the compounds of sulfur and organometallic compounds is being pursued by the staff. The biology staff is working on the composition of water as related to fish welfare, doing most of the field work at the Reelfoot Lake Biological Station. In the biology laboratory at Southwestern is one of the largest collections of ocean coral in the South.

All academic tests and examinations at Southwestern are conducted under the honor system, and the students have the privilege of the tutorial system from their second year if desired. This system, which was adopted at Southwestern in 1931, offers the student the advantage of personal guidance in weekly conferences with his professor-tutor and increased freedom in the selection of fields of study.

Recently a music department has been added to the college, and a magnificent collection of recordings has been obtained to acquaint students with the classics of music. A studio for radio broadcasting has been equipped in the campus, and regular programs are broadcast over a local station.

Memphis State College

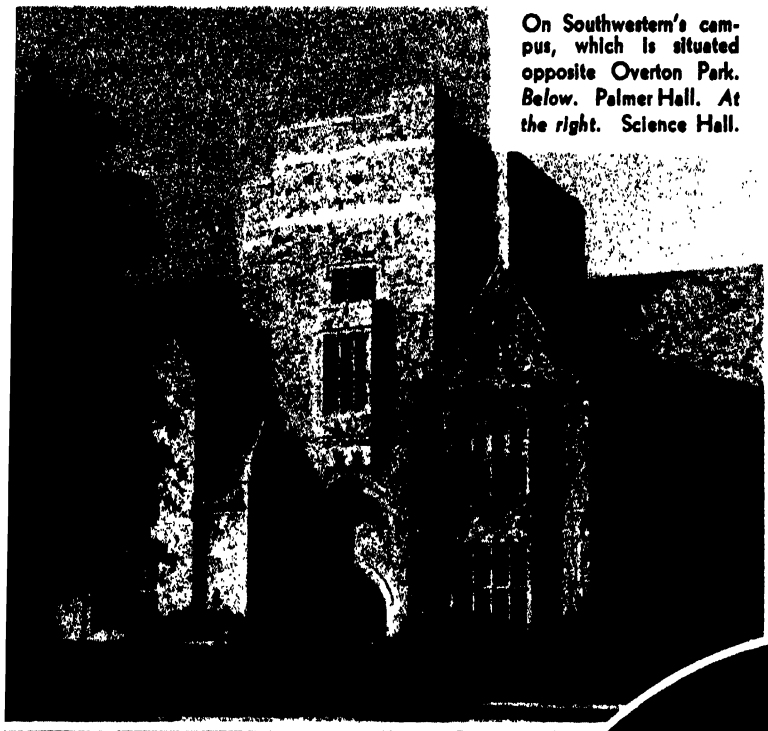
Memphis State College, located in the eastern part of Memphis, was established in 1909 as West Tennessee State Normal School on a site donated by the City of Memphis and Shelby County. Originally offering a two-year college training for teachers, it inaugurated the standard four-year college curriculum in 1925 and now offers premedical and other types of preprofessional courses. The college was recently renamed Memphis State College. It belongs to the Southern Association of Colleges and Secondary Schools, Teachers College Extension Association, and the American Association of Teachers Colleges.



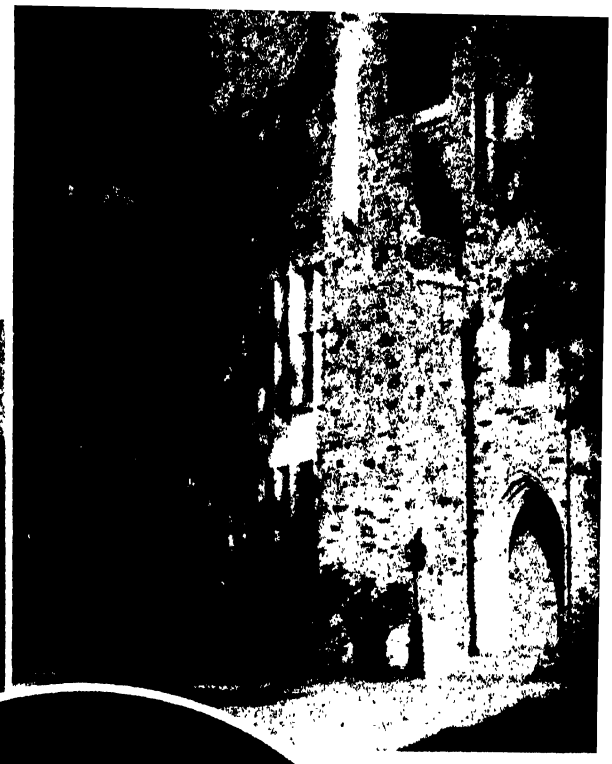
There are 11 principal buildings on the campus of 85 acres. Among them are the Brister Library containing about 25,000 volumes, the Training School—a regular primary school of the Memphis Board of Education operated by the college for practice teaching, and Manning Hall, planned by the staff now using it and erected in 1930, one of the best appointed science buildings in Tennessee. An arboretum and bird sanctuary have been started on a section of the campus.

Memphis State College has an enrollment of over 1,000 students.

The Christian Brothers College



The Christian Brothers College was founded in 1871 and for nearly half a century functioned as a degree-granting institution. During World War I the entire student body of the college department entered the Officers' Training Corps of the U. S. Army, and from then until 1940 the institution operated as a high school only although its charted name was retained.



Collegiate work was resumed in the fall of 1940 when the institution moved to its new campus at Central Avenue and East Parkway on a 33-acre tract in the park area. A junior college department was started to supplement the work of the high school department and to bring within reach of a greater number of young men an opportunity for higher education. The new school building contains well-

furnished laboratories and classrooms with modern arrangements. An interesting feature of its chemistry department is the use of semimicro laboratory procedures exclusively for qualitative analysis.

The college is conducted by the Brothers of the Christian Schools who also operate Manhattan College in New York, La-Salle College in Philadelphia, Saint Mary's College in Minnesota, and Saint Mary's College in California.

William R. Moore School of Technology

The William R. Moore School of Technology was founded as a result of a long-cherished desire of the late William R. Moore, wholesale dry goods merchant. It is an endowed technical trades school with an endowment of over $1,000,000 and a $250,000 plant.

The school plant is housed in two new buildings, an outstanding feature of which is the design and equipment of its shops. These are all on the ground floor and contain modern and up-to-date machinery. Working conditions found in shops of modern industrial plants are reproduced as much as possible.

The program is especially designed for high school graduates who desire intensive training in the mechanical trades that will enable them to fit directly into some specific work in an industrial plant.

Both day and night classes are given, a full course being two years of 11 months each. Under the able direction of J. Lister Skinner, two classes have already graduated from the institute.

University of Tennessee Health Service Division

The University of Tennessee has located in Memphis as the Health Service Division, the School of Biological Sciences, the Colleges of Medicine and Dentistry, and the Schools of Pharmacy and Nursing. Closely integrated into the program of the university are the John Gaston Hospital (the municipal hospital of Memphis), the Baptist Memorial Hospital, the Willis C. Campbell Orthopedic Clinic, and the Public Health Departments of Memphis and of Shelby County. The new Psychiatric Hospital of the State of Tennessee is nearing completion and it will be incorporated into the same program of education and health service. The total enrollment of students is about 1,000 annually, of which about 450 are in the College of Medicine. Most of the buildings housing these activities are relatively new and are well-equipped for their purposes. About them in a radius of several blocks are numerous private special clinics and offices of physicians and dentists and other services associated with the practice of medicine. The whole constitutes a large and compact medical service center.

The oldest of this group, the College of Medicine, was founded in Nashville in 1876. It absorbed the Medical Department of the University of Nashville about 1910 and in 1911 was moved by the Board of Trustees of the University of Tennessee to Memphis. It acquired buildings from the College of Physicians and Surgeons to start with and later absorbed the Memphis Hospital Medical College.

The college operates four quarters annually—a summer quarter in addition to the usual three quarters. Each course of the curriculum is offered each quarter so that students may enter at the beginning of any quarter and proceed to graduation in three years and one quarter if they wish. (One quarter is devoted to preparation for and completion of a comprehensive examination.) This system of medical education not only enables the student to complete the standard course in much less time, but it also achieves better pedagogic results by admitting the students in such small groups that they can all be taught at the same time in both laboratory and clinic. Incidentally but of importance, an expensive plant is kept almost continuously in operation and equipment is maintained for groups of 30 instead of over 100.

The Department of Preventive Medicine is especially active in undergraduate teaching and in research. In cooperation with the Tennessee Valley Authority and with the help of the National Research Council, a broad program of research into the fundamental problems of malaria is in active progress. The problem is under investigation simultaneously at the hands of anatomists, chemists, physiologists, pharmacologists, bacteriologists, and pathologists as well as specialists in malariology and public health. The work is coordinated and stimulated by weekly progress reports and conferences of the entire group.

The School of Biological Sciences receives students who have begun their basic scientific training in Liberal Arts Colleges and extends and specializes this basic foundation as the students pass on to the applied courses in their professional schools. It comprises the Departments of Anatomy, Chemistry and Pharmacology, Physiology and Pathology and Bacteriology. These departments, in addition to the training given undergraduate professional students, offer training for the master's degree and the doctorate of philosophy.

Siena College

Founded as a women's college by the Sisters of Saint Dominic in 1852, Siena College was a pioneer in this section in promoting night collegiate education for adults. Starting in 1935, the night classes are coeducational and now have an enrollment of about 175. The science subjects have been very popular. The college is affiliated with the Catholic University of America and is a member of the Catholic Education Association. It is approved by the Department of Education of the State of Tennessee as a teacher training school.

Besides its Administration Building, Siena College consists of a music branch, the Memphis Conservatory of Music, and the Goldsmith Memorial Library containing 12,000 volumes.

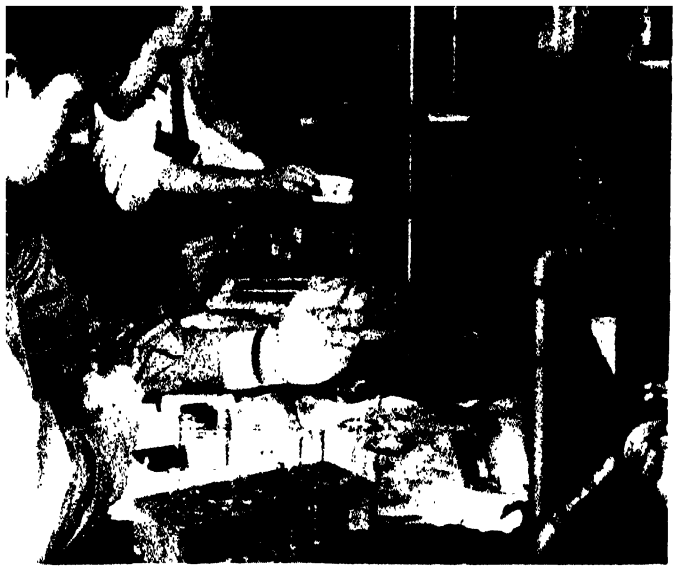
Specialized Institutes

There are several National Defense Schools in Memphis and vicinity. The University of Tennessee defense courses section offers courses in the college level, including engineering of any kind, to students working in defense industries.

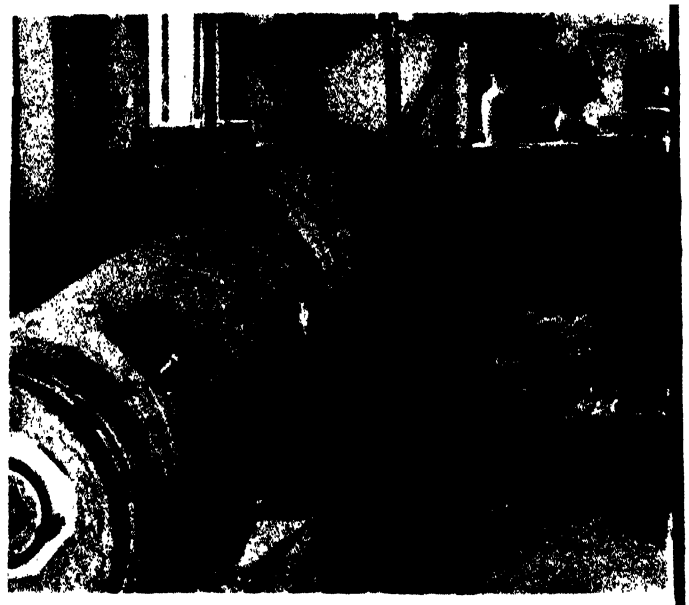
The National Defense School trains workers in aviation mechanics and related trades. The Shelby County School of Aeronautics in Whitehaven on U. S. Highway 51 is approved by the Civil Aeronautics Administration to train men in aircraft and aircraft engine mechanics. Related trades courses are also offered. The school runs 24 hours a day and has about 600 students.

Two night schools offer three-year courses in law; the Southern University College of Law with an extension school at Jackson, Tenn., has an average enrollment of 125, and the Memphis University Law School has about 50 students.

The Memphis College of Music, organized in 1933, is affiliated with Southwestern for the exchange of music and academic credits leading to degrees in either school. It is an associate member of the National Association of Schools in Music.



The Memphis Academy of Arts was incorporated in 1936 and gives instruction in all types of art work. Many of the commercial artists of Memphis were trained here.

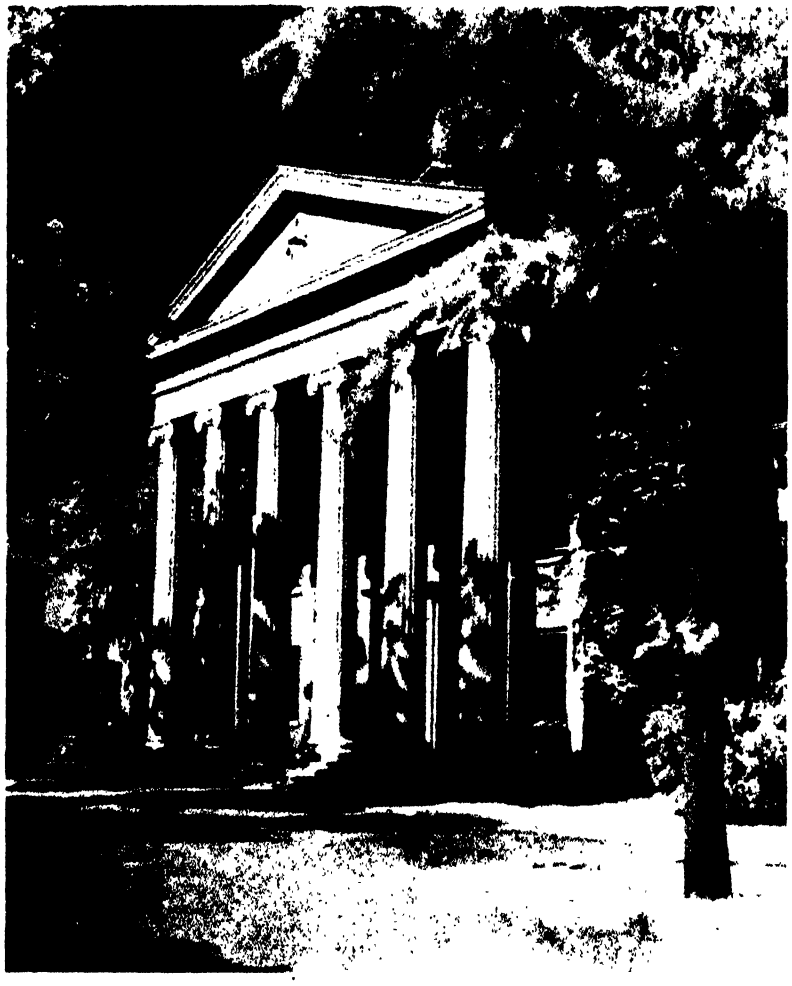


LeMoyne College

LeMoyne College is an outgrowth of LeMoyne Institute which was started after the Civil War for Freedman Negroes as a grade school, later becoming a high school. The college was started about 12 years ago and is largely supported by the American Missionary Association. It has a separate science building and a library housing about 16,000 volumes, all obtained in the past 10 years. Present enrollment is about 400.

The University of Mississippi

The University of Mississippi, the leader of educational ideals in the State of Mississippi, was opened in 1848 with a faculty of four and a student body of 50. This was the beginning of the present College of Liberal Arts and was actually the university until the Law Department was founded in 1854. The university was



Above. Semimicromethods for qualitative analysis, Christian Brothers College. *Right above.* Rotary kiln dryer at University of Mississippi Clays Laboratory. *Right.* Bottling student kits for general chemistry at Memphis State College.

The Lyceum, oldest building on the University of Mississippi campus

established upon its present site, a square mile of rolling land at an altitude of 500 feet with much natural beauty situated just west of the town of Oxford.

In 1861, on account of the existing Civil War and the enlistment of most of the students in the Confederate Army, exercises were suspended, not to be resumed until 1865. In 1882 the university was made coeducational. The attendance of women has increased until at present there are about 450 women in a total of 1,500 students.

Since 1893 the university has had regular summer school sessions. The Schools of Engineering, Education, Medicine, Pharmacy, Commerce and Business Education, and the Graduate School have since been added along with the Extension Department, the Department of Music, and the Department of Military Science and Tactics.

The university offers a high order of instruction in the major fields of human knowledge. It has land, buildings, and equipment valued at more than $4,600,000; it has well-equipped laboratories and a general library containing about 80,000 volumes along with the chemistry library containing about 20,000 volumes, most of which are journals.

The University of Mississippi has had many exceptionally able men serving it from its beginning and is in very able hands now. One of the members of the first faculty in 1849 was John Millington who had worked in the Royal Institution of London under Michael Faraday and Sir Humphry Davy. A. P. Barnard during his stay until 1861 equipped an excellent physics laboratory and had built for it one of the largest telescopes in the country at that time. L. Q. C. Lamar, who later became a member of President Cleveland's cabinet and then an Associate Justice of the U. S. Supreme Court, was a professor at "Ole Miss" in its early history.

Each of the foregoing institutions extends a cordial invitation to chemists attending the AMERICAN CHEMICAL SOCIETY'S 103rd meeting in Memphis, April 20 to 24, to visit its campus and inspect its facilities and laboratories.

Charles L. Wiswall, since 1933 director of sales of the R. & H. Chemicals Department, E. I. du Pont de Nemours & Co., Inc., Wilmington, Del., has been appointed assistant general manager of the newly created Photo Products Department. **Samuel C. Harris** has succeeded Mr. Wiswall as director of sales.

Safety Program of Alpha Chi Sigma

ALPHA CHI SIGMA, professional chemical fraternity, has initiated a safety program for its chapters located in 46 American colleges and universities. The objectives of the safety program point toward making chemical and chemical engineering students safety conscious in their academic work, giving them the proper attitude and training for their later industrial life, and by their example, inculcating among their associates the principles of safety.

The program originated through the work of H. B. Stevenson, East Central District counselor of the fraternity, of Cincinnati, Ohio, who became aware of the need for such activity by his contact with accident prevention work with his employers, the Procter & Gamble Co. Last year he instituted a program at two chapters located at the University of Cincinnati and at Case School of Applied Science in Cleveland. The success of this work led to the decision to sponsor a safety program for all collegiate chapters.

It was recognized that a successful program must be initiated through the heads of the departments of chemistry and chemical engineering at the schools involved. In every case the extent and development of the program have been made the responsibility of the individual chapter and the university. A broad program, prepared with the aid of the National Safety Council, was to serve as a basis for each college or university. The Grand Chapter of Alpha Chi Sigma has taken an association membership in the National Safety Council, and each chapter has been urged to apply for membership in the university and college classification of the council.

The response has included 20 acceptances of the program. Five chapters have tabled the program, generally because of well-established safety programs already in existence.

Research Fellowship in Colloid Chemistry

THROUGH the generosity of the Colgate-Palmolive-Peet Co., a research fellowship in colloid chemistry has been established at the University of Southern California, Los Angeles, Calif., for work under the supervision of Robert D. Vold. The fellowship allows full time for study and research leading to the Ph.D. and is awarded annually, carrying a stipend of $1,000.

Wendell Markham, who received his A.B. from Colorado State College and his M.S. from Oklahoma A. and M., has been appointed to the fellowship for the current year. He will undertake research in the field of emulsions.

Seven Months of Defense Training in Chemistry

Austin M. Patterson, U. S. Office of Education, ESMDT, Washington, D. C.

During the first seven months of the Engineering, Science, and Management Defense Training program—July 1, 1941, to February 1, 1942—112 courses for training chemists were approved, with an authorized enrollment of 4,213 (this figure will shrink a few per cent when the final reports arrive). These courses represent only about one third of the total chemical training, the rest being classed under "engineering". "Chemical engineering" shows an enrollment for the seven months of 7,329, and "basic chemistry for engineers" an enrollment of 1,159, making a total authorized enrollment of 12,701 in 336 chemical courses.

Up to July 1, 1941, all the courses of college-grade defense training sponsored by the U. S. Office of Education were for engineers, and the program was called Engineering Defense Training (EDT). The program for the present fiscal year is for chemists, physicists, and production supervisors as well as engineers and is called Engineering, Science, and Management Defense Training (ESMDT). N. W. Rakestraw is the chemistry representative on the National Advisory Committee. The work consists of short, practical courses designed to train for particular jobs in defense industries and in government defense agencies. Most of them are given in the evening to persons already employed and very often they serve for "upgrading" on a defense job. Various universities and colleges offer their facilities, investigate the needs, and give these courses, while the Government pays the extra expense entailed.

The most numerous class of chemical trainees (if we include here "basic chemistry for engineers") are employees in industry, either in the laboratory or in the plant, who have had no previous chemistry or at best a high school course but who need chemistry in their jobs. They are given elementary college-grade chemical training. Next in point of numbers come those who have had a general chemistry course and who are trained for work as laboratory technicians. They usually take a course in qualitative and quantitative analysis with a strong industrial slant, but a few courses in general laboratory technique have also been given. A smaller number of applicants, who have had two years of college chemistry or engineering, find an elementary course in organic chemistry valuable; this is given only as an in-service course or as preliminary to an applied course to follow, as on explosives or plastics. A still smaller number are ready for an in-service course in physical chemistry. There are also courses on various special topics, such as organic analysis and chemical microscopy. In the chemical engineering field a course in fundamentals, usually emphasizing unit operations, is the most common type. Then come courses (in order of frequency) on explosives, plastics, inspection and testing, and individual industries such as petroleum refining.

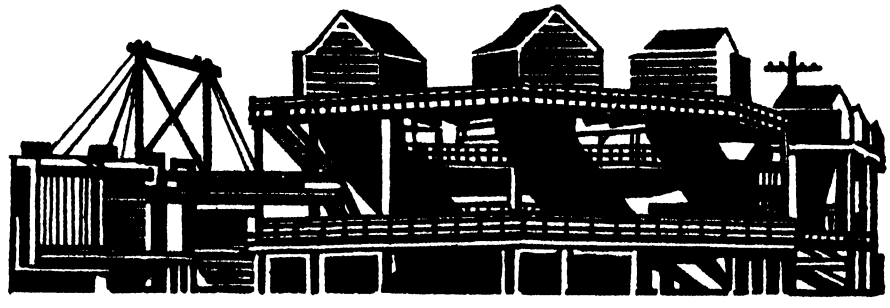
The figures for chemistry and physics are not so impressive as for engineering and management, but there is great need in all four fields. The shortage of professionals in these lines is serious and the supply must be supplemented by emergency training such as ESMDT can do. Results are of course not perfect. There is a certain amount of waste. Some trainees do not finish; some take jobs in which their training is of no help; a very small proportion do not secure employment. But by and large, results are encouraging; the courses do help war production. Out of more than 1,000 replies from industry to an inquiry as to the value of the ESMDT program all but four were favorable and many were enthusiastic.

The number of institutions approved to February 1 to offer courses is 183 and all but 18 of these are approved for chemistry. The number of courses is increasing and a steady expansion in all fields is expected for some time. Estimates center around a doubled demand for trained persons next year as compared with this.

Apologies

We apologize to American Cyanamid & Chemical Corp. for indicating in Chemical and Engineering News for February 10 (page 219, "Loosening Glass Stopcocks and Glass Fittings") that Aerosol OT is a du Pont product. Aerosol OT is made and sold exclusively by American Cyanamid & Chemical Corp. under U. S. Patent 2,028,091.

Swift & Co. Grants Fellowship to University of Minnesota



The University of Minnesota has received from Swift & Co., Chicago, a grant to be used under the direction of Ancel Keys in his studies on the relation of fatigue to diet. This work was originally sponsored by the National Research Council and is now operating under the Office of Scientific Research and Development in direct cooperation with the United States Army Quartermaster Corps. Although much of this work is being directly applied to military and industrial needs during the present emergency, it will be possible to extend the findings to civilian nutrition. Dr. Keys received his Ph.D. from the University of California in 1930. Since 1937 he has been associated with the Department of Physiological Hygiene at the University of Minnesota, where he has the rank of full professor and is in charge of the department.

Montana Research Fellowships

The Montana School of Mines, in cooperation with the State Bureau of Mines and Geology, offers several research fellowships and graduate assistantships in geology, metallurgy, mining, and mineral dressing, open to college graduates. Fellowships are for nine months and carry a stipend of $540, while assistantships are for two nine-month periods, with a stipend of $675. Applications must be filed before April 15 with Eugene S. Perry, Chairman, Graduate Committee, Montana School of Mines, Butte, Mont.

Utah Fellowships Offered

The Utah Engineering Experiment Station is offering several research fellowships for the school year 1942–43. Each carries a stipend of $600. Fellows are exempted from the nonresidence fee but are required to pay other university fees, which average about $100 for the school year. Fellowships are open to college graduates who have had the proper training in mining, metallurgy, chemistry, or geology. Applications should be submitted before April 1. Blanks and further information may be obtained by addressing S. F. Ravitz, Director, Utah Engineering Experiment Station, University of Utah, Salt Lake City, Utah

Advances in Entomology[1]

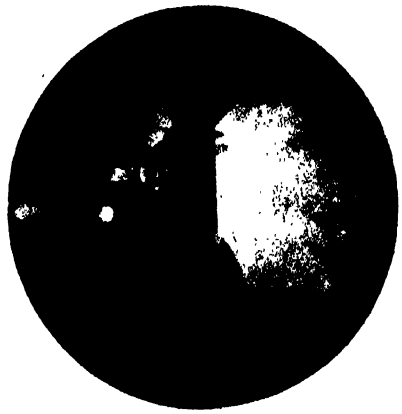
Iowa Agricultural Experiment Station, Ames, Iowa

Inorganic Stomach Poisons

NOTWITHSTANDING the introduction of new stomach poisons, acid lead arsenate ($PbHAsO_4$) continues to hold an important place among agricultural insecticides. Criticism of its use on fruits and vegetables has arisen from the belief that the residues might lead to human poisoning. Investigations of the past several years have allayed this fear; those of 1941 seem to remove altogether the danger from residues on agricultural products that have been properly sprayed or dusted with lead arsenate.

The U. S. Public Health Service has announced, in a series of bulletins and reports, the results of a comprehensive study of the health of persons exposed to acid lead arsenate. A large group of men, women, and children, including consumers of sprayed fruit, orchardists exposed to arsenical mist and dust and to actual contact through the handling of spray materials, and individuals exposed in other ways, were examined in this study. Among 1,231 such individuals, Neal *et al.* (*176*) found only 7 persons with clinical and other evidences that might be interpreted as minimal lead arsenate poisoning. None of these cases, however, met the established criteria of lead intoxication, incipient plumbism, or lead poisoning. The general health of populations in regions where spraying with lead arsenate has been practiced for years was found to be as good as that of populations in regions where spraying is not widely practiced. The only recommendation made is that spray operators be protected from adsorption of excessive amounts of lead and arsenic. Various phases of the investigation are treated in separate papers by Fairhall and Miller (*70, 71*) and by Webster (*252-55*).

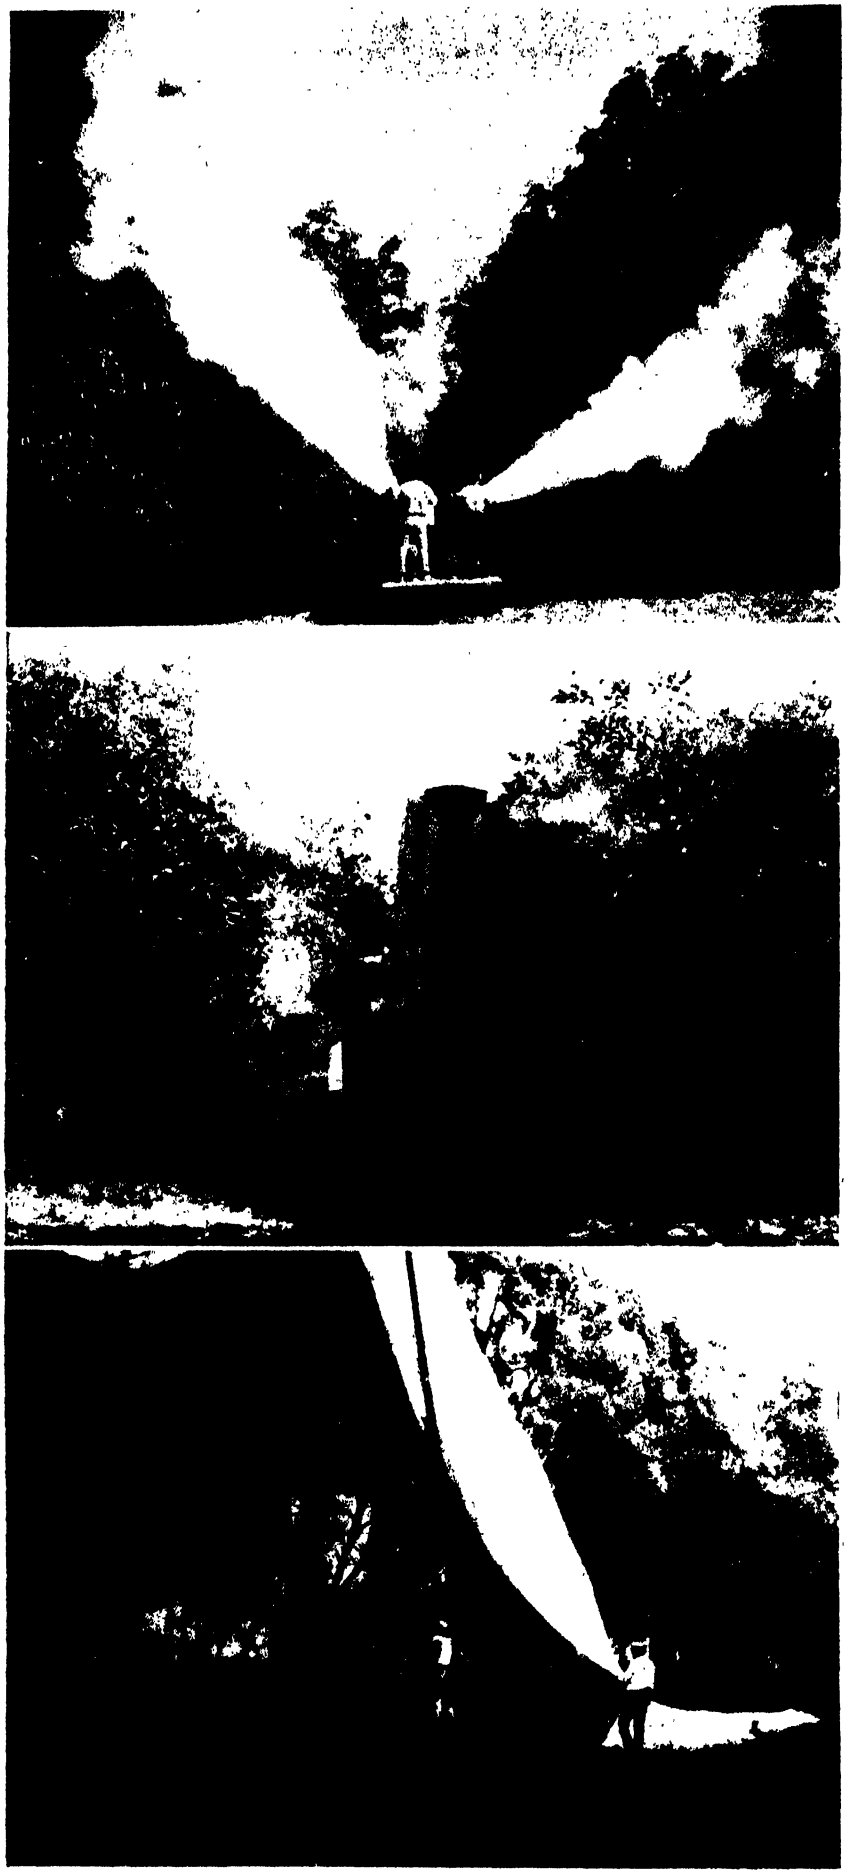


New light is shed by several papers on the ratio of lead (as Pb) to arsenic (as As_2O_3) in residues on fruit trees sprayed with lead arsenate. In attempting to confirm the results of an earlier study (*186*), Pearce and Avens (*187*), New York Experiment Station, observed that this ratio is not changed (*68*) even after long weathering of the residue, if lead arsenate alone is present in the original spray. The addition of lime tends to increase the ratio, while Bordeaux mixture, aluminum sulfate, and petroleum oil mixtures act in the opposite direction. As the number of cover sprays is increased, the ratio approaches the theoretical value for $PbHAsO_4$, and later spray deposits tend to check and mask the decomposition of earlier deposits. Frear and Worthley (*78*), Pennsylvania Experiment Station, found no consistent differences in either fresh or weathered residues from different spray mixtures. Differences in the ratio were noted, however, between seasons and between apple varieties in the same season. The latter observation pertains even to residues on fruit sprayed with lead arsenate mixtures from the same spray tank.

In Germany, Speyer (*220*) observed that spraying regularly with lead arsenate over a period of years led neither to an increase nor a decrease in the resistance of populations of the geometrid moth, *Cheimatobia brumata*. This result is considered remarkable in view of the known readiness of this insect to form local races.

A number of methods for the quantitative determination of lead and arsenic in biological materials have appeared recently. Several methods for lead determination relating to the use of dithizone are described by Kozelka and Kluchesky (*137, 138*), University of Wisconsin, and by Bambach and Cholak (*12, 34*), University of Cincinnati. A modification of the method of Cholak and Bambach permits electrolytic or dithizone isolation of the lead and its estimation by a polarographic method. Fairhall and Keenan (*69*), U. S. Public Health Service, offer a rapid micromethod for lead in urine based on separation with dithizone. Letonoff (*148*), Philadelphia General Hospital, determines lead in human blood by a colorimetric method which involves the use of diphenylcarbazide.

Noteworthy advances in the use of calcium arsenate for the control of cotton insects are recorded. Attention has been given particularly to the effect on toxicity of certain physical and chemical properties of calcium arsenates. R. C. Gaines *et al.* (*85*), Bureau of Entomology and Plant Quarantine, confirm earlier work in field experiments with calcium arsenates of high, medium, and low content of water-soluble As_2O_3 that demonstrated equal effectiveness for these compounds when they were applied as dusts against the boll weevil, *Anthonomus grandis*. In cage tests, however, calcium arsenates of high water-soluble arsenic content and relatively large particle size were more toxic to the boll weevil than calcium arsenates of lower water-soluble content of arsenic and smaller particle size (*215*). In the field, likewise, the arsenates of higher water-soluble As_2O_3 were more effective in reducing infestations of tarnished plant bugs, *Lygus pratensis oblineatus*, and rapid plant bugs, *Adelphocoris rapidus*, than the arsenates of lower arsenic content (*85*). Similar results are reported from the Texas Experiment Station, by J. C. Gaines (*81*). Other contributions to this subject are made by J. C. Gaines (*82*), R. C. Gaines (*84*), Moreland *et al.* (*173*), and Rainwater and Bondy (*197*). According to Ewing (*65*), Bureau of Entomology and Plant Quarantine, dusting with calcium arsenate is more effective than spraying with either calcium or lead arsenates for controlling heavy infestations of boll weevils, whereas for light infestations spraying with lead arsenate is more effective.



Dusting cotton plants with calcium arsenate is often followed by marked increases in the number of cotton aphids, *Aphis gossypii*. Folsom and Bondy (*76*) thought the arsenate destroyed the parasitic insects that held the aphids in check. Dunnam (*57*), Bureau of Entomology and Plant Quarantine, noticed that the leaves of the more pilose varieties of cotton retained greater quantities of arsenical dust than plants with smoother foliage but, in spite of an increase of the aphid population proportionally to the number of hairs on the lower surfaces of the leaves, the ratio of increase for dusted cotton was greater on the glabrous plants (*58*). Furthermore, the aphids increased on all types of plants to which calcium arsenate was applied, while the rate of parasitization remained nearly constant. Working from the hypothesis that calcium or arsenic might be absorbed by the cotton plant and that one or both of these elements might stimulate the reproduction rate of the aphids, Dunnam and Clark (*59*) found that some calcium arsenate is taken up by the leaves and roots of the cotton plant. The pH of the soil is also increased by the arsenical,

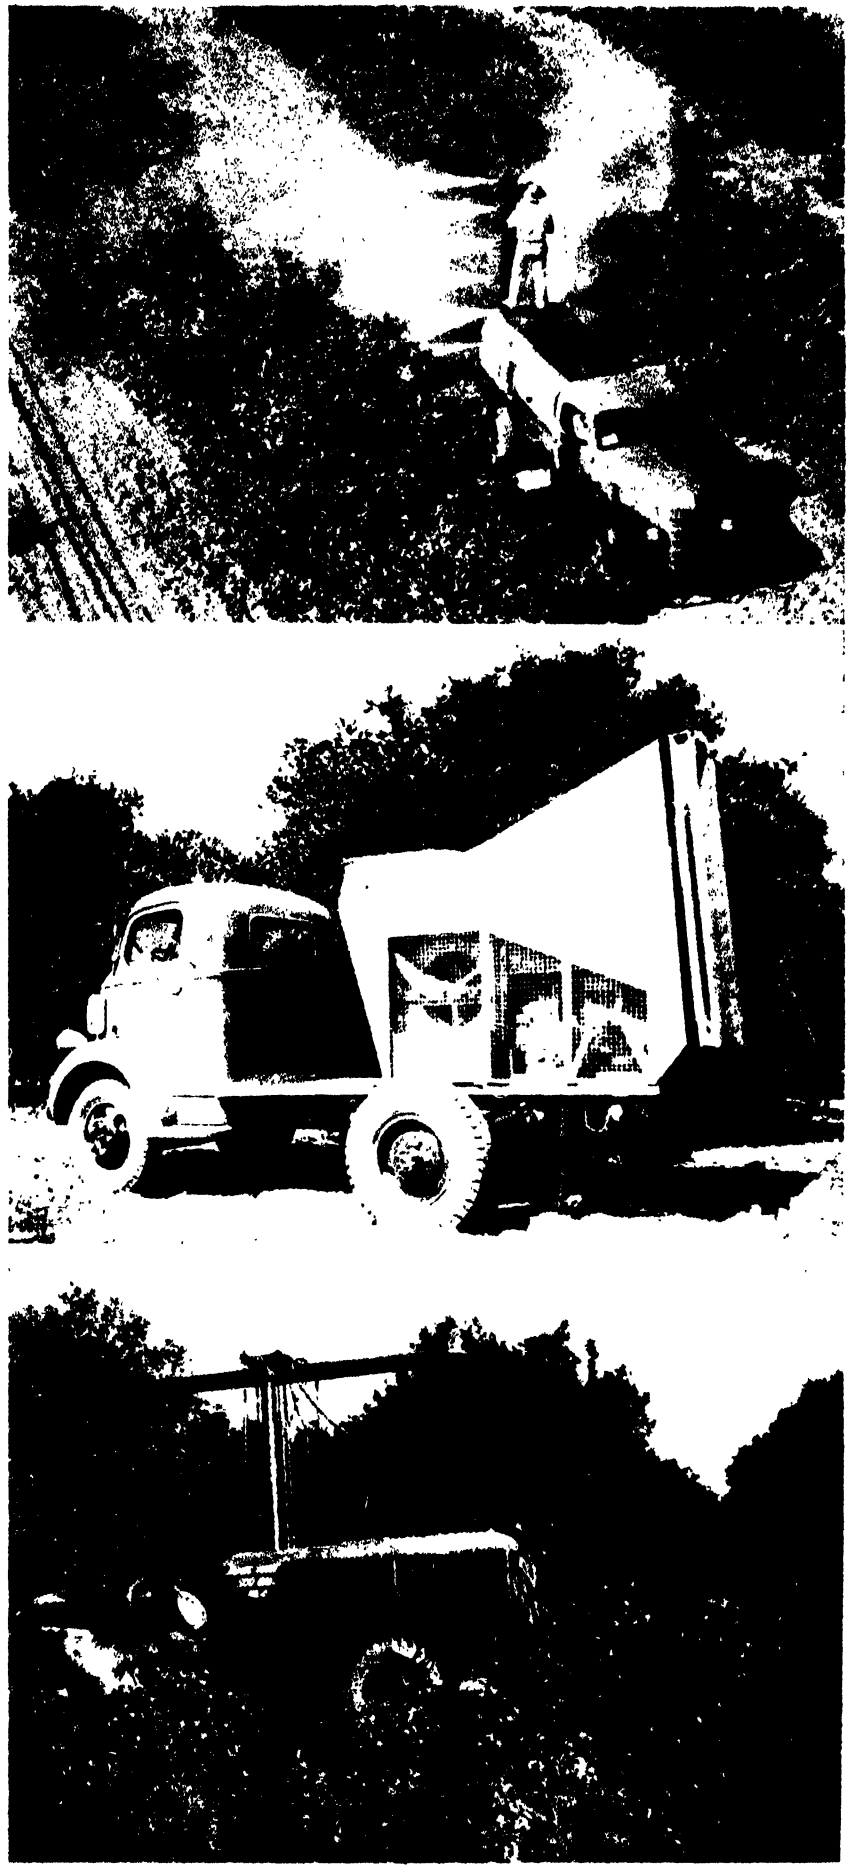
and calcium probably increases the pH of the leaf cell sap and certainly enhances its value as food for the aphids. Under these conditions, reproduction of the aphids is increased. To offset this favorable action of calcium arsenate on the aphids, substances were added to the sprays and dusts that would decrease alkalinity and reduce the content of water-soluble arsenic. Plants dusted with zinc arsenate (pH 6.40) held fewest aphids and appeared in best condition. Probably zinc salts are best suited for neutralizing and "buffering" calcium arsenates.

Basic copper arsenate is one of the newer stomach poisons. In cage tests made by Moreland *et al.* (*173*), Bureau of Entomology and Plant Quarantine, this compound proved more toxic than calcium arsenate to the boll weevil, the bollworm, *Heliothis armigera*, and the cotton leaf worm *Alabama argillacea;* but the experiments of Smith *et al.* (*215*) indicate that it is less effective for boll weevils than dicalcium arsenate. The studies of Watts (*250*), South Carolina Experiment Station, show that basic copper arsenate has poor dusting properties and requires dilution with a mixture of cottonseed meal and kaolin for effective use against *Heliothis armigera* on tomatoes. Boyce and Bartlett (*21*), Citrus Experiment Station, tested basic copper arsenate in sprays against the walnut husk fly, *Rhagoletis completa*, obtaining results that compared favorably with those from natural cryolite. Basic zinc arsenate and basic lead arsenate were less effective.

Analyses of samples of commercial Paris green by Carter and Smith (*29*), Bureau of Entomology and Plant Quarantine, reveal wide departures from the accepted formula, $Cu(C_2H_3O_2)_2.3Cu(AsO_2)_2$. Several of these samples contained appreciable quantities of arsenic in pentavalent form, while others appeared to contain no Paris green and to consist of copper metarsenite or indefinite mixtures of copper arsenite and arsenate. Henderson and Howard (*113*), Georgia Department of Public Health, compared Paris green with pyrethrum-petroleum oil emulsion as larvicides for anophiline mosquitoes, obtaining results that favored Paris green. Middlekauff and Hansberry (*170*), Cornell University, detected no significant difference in toxicity between trisodium arsenite and trisodium arsenate when administered to three species of fruitflies, *Rhagoletis pomonella, R. fausta*, and *R. cingulata*.



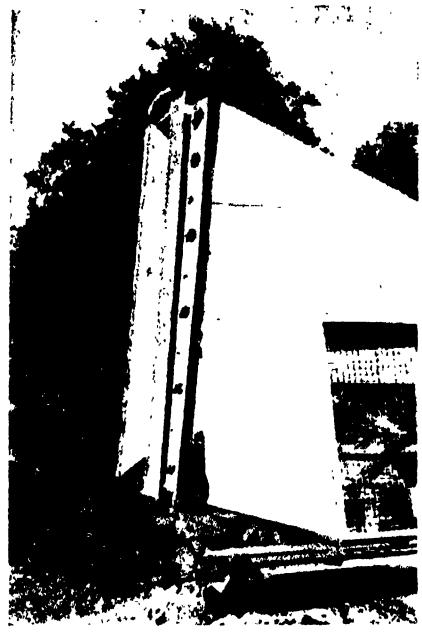
Lennox and Webber (*146*), Australian Council for Scientific and Industrial Research, tested a group of arsenical compounds on larvae of the blowfly, *Lucilia cuprina*. The highly toxic compounds, arranged in decreasing order of effectiveness, were barium arsenite, calcium arsenite, arsenic acid, Paris green, and arsenic trioxide. Less effective in order were zinc arsenate, aluminum arsenate, lead arsenate, and calcium arsenate. Toxicity, in general, was a function of the

stability of the compound as measured by its soluble arsenic content, but the cation also seemed to play some part. Hobson (*115*), University College of North Wales, reports encouraging results with calcium arsenite and lead arsenite as larvicides for the sheep maggot, *Lucilia sericata*.

Several important articles on the penetration, disposition, and effects produced by arsenical compounds in the bodies of insects are noted in the recent literature. Using the stomach of the honeybee, *Apis mellifera*, as a semipermeable membrane, Zänkert (*267*), Biological Institute, Berlin-Dahlem, failed to demonstrate the passage of arsenic from a solution of sodium arsenite through the wall of the stomach. Neither did iron from a solution of ferric ammonium sulfate penetrate these membranes. Norton and Hansberry (*183*), Cornell University, fed radioactive arsenic to silkworms, *Bombyx mori*, and analyzed for arsenic the feces, regurgitated material, blood, intestine, and other tissues of the insects by means of a Geiger-Müller counter. The initial elimination of arsenic was more rapid and complete for the insoluble than for the soluble arsenates, and the arsenates that were eliminated most completely tended to be least toxic. After absorption, elimination proceeded slowly and was greatest for the arsenates that were most completely absorbed. Most of the absorbed arsenic was found in the midgut wall, and the authors suggest that absorption takes place as complex ions containing some of the metallic element in addition to arsenic rather than as simple arsenic ions. Woke (*262*), Bureau of Entomology and Plant Quarantine, studied histologically some of the effects produced by arsenic on insects. He finds that ingestion of lead arsenate, Paris green, calcium arsenate, calcium arsenite, and arsenic trioxide by the southern armyworm, *Prodenia eridania*, results in the disintegration of the cells of the midgut epithelium and damage to its muscle fibers.

Woke also fed sodium fluoride, cryolite (Na_3AlF_6), and barium fluosilicate to southern armyworms. Histological preparations of the larvae revealed disintegration of the cytoplasm and nuclei of the midgut epithelium following ingestion of sodium fluoride, whereas cryolite caused disintegration of the walls of the midgut and injury to its musculature. On the other hand, barium fluosilicate produced no detectable changes in the histological picture of the midgut epithelium, and even the peritrophic membrane of poisoned larvae remained intact.

At the Texas Experiment Station, J. C. Gaines (*81*) tested a cryolite-sulfur dust against the boll weevil, which proved inferior to calcium arsenate for controlling this insect. Similar results were reported by McGarr (*155*), Bureau of Entomology and Plant Quarantine. However, a natural cryolite-sulfur dust was more effec-



CITRUS EXPERIMENT STATION, RIVERSIDE, CALIF.

Top. Boom sprayer in operation applying zinc sulfate–lime on citrus. *Center.* Latest type citrus duster. *Bottom.* Tower lowered and arranged for travel on the highway.

tive against the cotton bollworm, than calcium arsenate (*82*), although it was less toxic to the rapid plant bug. Natural cryolite was more effective than synthetic cryolite in sulfur dusts for cotton bollworm control (*83*) and in sprays and dusts for the walnut husk fly (*21*). Watts (*250*) finds cryolite generally less economical to use than calcium arsenate for controlling *Heliothis armigera* on tomatoes. Excellent dusts for this insect are made by incorporating cryolite in cottonseed meal. Cryolite-cornmeal baits also offer promise for the control of *Heliothis* on tomatoes. Cryolite dusts and sprays have given the best and most consistent results for the pink bollworm, *Pectinophora gossypiella* (*30*). Steiner and Worthley (*223*), Pennsylvania Experiment Station, find cryolite and barium fluosilicate sprays more effective than arsenical spray for the plum curculio, *Conotrachelus nenuphar*, on peaches, but practical use of the compounds is restricted at present by their tendency to injure the foliage. Karr (*133*), Pennsylvania Salt Manufacturing Co., found that soap bark extract and several proprietary wetting agents lowered or did not improve the effectiveness of sodium silicate or hydrochloric acid solutions for removal of residues from apples sprayed with natural cryolite.

A recent development in control of the Mormon cricket, *Anabrus simplex*, is discussed by Cowan and Shipman (*38*), Bureau of Entomology and Plant Quarantine. Until 1935 dusting with sodium arsenite was relied upon chiefly to suppress this insect. Since then extensive experimentation with poisoned baits has led to the use of a bran-sawdust mixture with sodium fluosilicate as the poisonous ingredient.

The value of sulfur as a contact insecticide and fumigant is established, but almost nothing is known concerning its value as a stomach poison. A recent paper on this subject by Dickinson *et al.* (*51*), Ohio State University, is timely. In the laboratory sulfur was lethal to the southern armyworm, variegated cutworm, *Lycophotia margaritosa saucia*, and fall armyworm, *Laphygma frugiperda*. It was not toxic to larvae of several species of lepidopterous insects, or to larvae of the Mexican bean beetle, *Epilachna vaerivestis*, or Colorado potato beetle *Leptinotarsa decemlineata*. Tests with purified crystalline sulfur, sulfur containing known impurities, and sulfur residue insoluble in carbon disulfide suggest that the toxicity of sulfur as a stomach poison may be related to particel size, to allotropic form, or to the presence of unidentified impurities. Gooden (*94*), Bureau of Entomology and Plant Quarantine, has determined the particle diameters of 54 commercial insecticidal sulfurs by an air permeation method (*95, 96*). The average diameter ranged from 5 to 25 microns. Plain ground sulfurs and sulfur flowers had the largest particles (13 to 25 microns in diameter), special process sulfurs the smallest (5 to 8 microns), with ground, conditioned and ground, wettable sulfurs occupying an intermediate position with respect to diameter.

CITRUS EXPERIMENT STATION, RIVERSIDE, CALIF.

Showing the nozzle arrangement in one of the discharges of the spray duster

DeLong (*48*), in collaboration with the Bureau of Entomology and Plant Quarantine, presents evidence for a stomach poison action of copper compounds on the potato leafhopper, *Empoasca fabae*. Apparently the insects do not receive directly the copper compounds from the sprayed plants, but rather from the plant liquids into which the compounds have passed by absorption from the spray residue. There is also the possibility that the leafhoppers are affected by some product elaborated by the plant through the physiological action of the copper spray. Kennedy (*134*) has tested copper sulfate as a mosquito larvicide under conditions that may indicate action as a stomach poison. In natural waters, which precipitate the copper as copper carbonate, the particles of the latter are ingested by and kill the mosquito larvae.

Elm trees can be killed without becoming liable to the attack of bark beetles by the introduction of certain inorganic compounds into the sap stream according to Whitten (*257*), Bureau of Entomology and Plant Quarantine. Copper sulfate, sodium arsenite, and zinc chloride are the compounds most widely used for this purpose.

Boric acid seems to have a place in the treatment of maggot-infested wounds of sheep (*145*). In Australia, Lennox (*146*) proposes as a wound dressing a mixture of boric acid, tar oil, bentonite, a wetting agent, and water. Knipling (*135*), Bureau of Entomology and Plant Quarantine, reports boric acid rather toxic to dipterous fleece worms of sheep in the United States.

Tests made at the Iowa Experiment Station with baits containing barium compounds for control of the firebrat, *Thermobia domestica*, revealed five compounds of definite toxicity (*202*): barium fluosilicate, barium carbonate, barium oxalate, barium peroxide, and barium triphosphate. Of these, barium carbonate proved the most practical for use in baits, being as effective as sodium fluoride and less repellent. Lennox (*148*) finds barium chloride and cadmium chloride highly toxic to larvae of *Lucilia cuprina*.

The influence of electrostatic charges on the insecticidal effectiveness of dust particles is the subject of an important paper by Wilson *et al.* (*260*), University of Wisconsin. Frictional electrostatic charges are induced on the particles during the process of applying the dusts. Diluents that produce comparatively high charges (pyrophyllite, flaky talcs, calcium carbonate, gypsum) give higher mortalities than diluents (clays and some talcs) that produce lower charges. Galloway and Burgess (*86*), Bureau of Entomology and Plant Quarantine, describe a method of applying insecticidal or fungicidal dusts with liquid adhesives, emulsions, and water. The dust particles are coated with the liquid as they leave the apparatus. Flanders (*74*), Citrus Experiment Station, reviews the literature on the effects of inert and toxic dusts on insects.

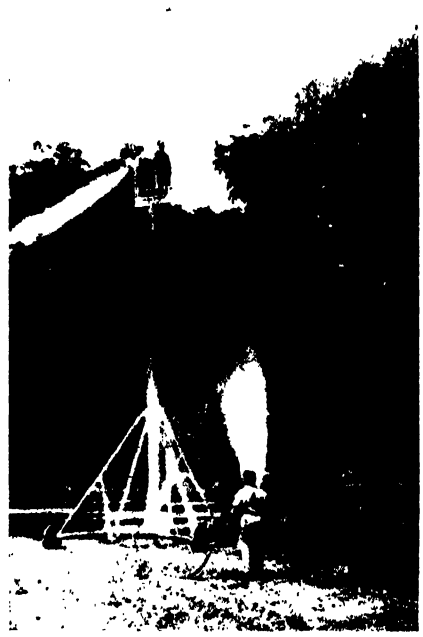
Organic Stomach Poisons

Phthalonitrile, a new insecticide, appears to have either a stomach poison or contact action on insects. Trials on nine species of leaf-eating insects by Swingle *et al.* (*233*), Bureau of Entomology and Plant Quarantine, show that phthalonitrile is generally superior to lead arsenate and derris. Garman's tests (*88*) with the adult apple maggot fly also indicate promise for phthalonitrile.

Middlekauff and Hansberry (*170*), Cornell University, found Reineke salt $[NH_4(NH_3)_2Cr(SCN)_4 . H_2O]$ more toxic than several arsenic compounds and nicotine to the adult apple maggot fly and two other species of fruit flies.

A series of organic compounds containing nitrogen, sulfur, or both were tested on larvae of the fleshfly, *Lucilia sericata*, by Hoskins *et al.* (*119*), University of California. The compounds were administered in a synthetic food mixture. Outstanding in toxicity were compounds possessing the group, —C(=S)N=, illustrated strikingly by thiourea, some thiourea derivatives, and certain thioamides. Thiourea and some of its derivatives were as toxic to this larva as rotenone and 2,4-dinitro-6-cyclohexylphenol, and more toxic than nicotine and a preparation containing 50 per cent of β-butoxy-β-thiocyanodiethyl ether. Thiourea is also definitely toxic to larvae of the clothes moth, *Tineola biselliella*, but leaf-eating insects are not highly susceptible

to it. The toxic action of thiourea seems to be related, in some manner, to the behavior of the enzymes concerned with the metabolism of a high protein diet. Metcalf and Kearns (*169*), University of Illinois, have studied a series of picramic acid and toluene sulfonyl chloride derivatives as stomach poisons for the greenhouse leaf tier, *Phlyctaenia rubigalis*. *N,N*-dimethylpicramic acid was most toxic and eight other compounds—*N*-methylpicramic acid, 3,4-dichlorobenzene-*N*-methylsulfonamide, 2,4-dinitro-1-naphthol, picramic acid, *N*-caproylpicramic acid, 2,6-dinitro-*p*-toluenesulfonyl chloride, *p*-toluenesulfonamide, and phenothioxin—were more toxic than acid lead arsenate. A free OH group is apparently necessary in picramic acid derivatives for high toxicity. Replacement of one or both hydrogen atoms of the NH_2 group by aliphatic groups in these derivatives increased toxicity to the insect and decreased toxicity to plants, while tertiary picramic acid amines were more toxic to the insect and less toxic to plants than the secondary amines.



Xanthone, $CO:(C_6H_4)_2:O$, a recent development among organic stomach poisons, has received experimental attention during 1941. Webster *et al.* (*251*), Washington Experiment Station, report favorable results in codling moth control with a proprietary insecticide containing xanthone used in either an aqueous or a petroleum-oil spray.

Cutright and Vogel (*41*), Ohio Experiment Station, obtained less favorable results with this preparation against the same insect, and Steiner and Worthley (*223*) report negative results against the pistol case-bearer. In laboratory and orchard experiments on the oriental fruit moth, *Grapholitha molesta*, Garman (*87*) found the xanthone-containing preparation superior to lead arsenate. Boyce and Bartlett (*21*) failed to control the walnut husk fly with xanthone, and noticed that it caused moderate to severe injury of walnut foliage.

New developments are reported in the use of antimony compounds for control of the citrus thrips, *Scirtothrips citri*, in California. Persing, Bartlett, and Beier (*189*), Citrus Experiment Station, believe potassium antimonyl citrate is a valuable substitute for tartar emetic (potassium antimonyl tartrate) now becoming unavailable as a result of war conditions (*190*).

In ordinary spray waters, the citrate is not so effective as tartar emetic, but when the reaction of the citrate solutions is changed from pH 4.4 to pH 6.0 to 7.0, toxicityto the greenhouse thrips, *Heliothrips haemorrhoidalis*, closely approaches that of tartar emetic solutions. Adjustment of the pH of citrate solutions with sodium hydroxide, sodium bicarbonate, or potassium hydroxide has not increased significantly the effectiveness of the sprays for citrus thrips on lemons, but on oranges the citrate solutions are reasonably effective (*190*). A discussion of the conditions which affect the use of tartar emetic for citrus thrips control is given by Persing and Boyce (*191*).

The large-scale application of insecticides in agricultural practices always raises the question of the effect of the poisons on honeybees. The growing use of antimony compounds for insect control induced Eckert (*65*), University of California, to study the effect of tartar emetic on bees. The minimum lethal dose was established as between 3 and 6 micrograms per bee. Under field conditions, however, bees do not feed sufficiently upon the sweetened tartar emetic spray to cause death. Bertholf and Pilson (*14*), Western Maryland College, found that phenothiazine, which under laboratory conditions is highly toxic to codling moth larvae, was almost nonpoisonous to the honeybee. In comparison, calcium arsenate, arsenic pentoxide, cryolite, and lead arsenate were toxic in about the order given. Some samples of lead arsenate, in which the particles were relatively large, met the requirements of codling moth control yet were nearly nontoxic to bees. Sturtevant *et al.* (*226*), Bureau of Entomology and Plant Quarantine, have studied possible causes of the serious losses of bees in Utah. Orchard spraying seems to furnish the most probable source of bee poisoning, and spraying of sugar beets with Paris green contributes another source. Phenothiazine proved highly toxic to blowfly larvae, *Lucilia cuprina* (*143*), and substituting methyl, ethyl, acetyl, or benzo radicals into the parent compound reduced toxicity. Believing that the variable results obtained with phenothiazine for codling moth control might arise from the form of the sulfur used in its preparation, Siegler and Smith (*210*), Bureau of Entomology and Plant Quarantine, prepared the compound from amorphous sulfur, crystalline sulfur, and a mixture of equal parts of these two forms. The three phenothiazine preparations were equally toxic to codling moth larvae, indicating that the variations in toxic action must lie elsewhere than in the form of the sulfur used. Woke (*262*) was unable to find histological changes in the midgut of a southern armyworm which had been poisoned with phenothiazine.

CITRUS EXPERIMENT STATION, RIVERSIDE, CALIF.

The spraying of Persian walnut trees with basic lead arsenate for control of codling moth. This tower is 30 feet tall, but some are as high as 40 feet.

Experiments completed in South Africa suggest a possible use of calcium chloroacetate in grasshopper baits. In the laboratory Lea and Nolte (*142*), Department of Agriculture and Forestry, Union of South Africa, demonstrated that calcium chloroacetate was an effective poison for the brown locust, *Locustana pardalina*, and the red locust, *Nomadacris septemfasciata*, though it was somewhat less toxic than sodium arsenite. In field experiments less encouraging results were obtained. Barium chloroacetate and bromoacetate were less toxic than the calcium compound in the order given. Dimethylglyoxime was also toxic in baits for these insects. Other information on baits for these insects is given by du Plassis and Nolte (*60*). Against larvae of *Lucilia cuprina* Lennox (*143*) found that calcium chloroacetate, chloroacetamide, and the dye compounds, methylene blue, crystal violet, malachite green, brilliant green, and eosin, were markedly effective. When added to a food medium, methylene blue prevented entirely growth of the larvae. Pentachlorodioxytriphenylmethane, sulfonic acid, and a chlorinated phenyl benzyl phosphonium compound possess mothproofing properties according to Herrmann (*114*). A review of mothproofing agents is contained in an article by Van Antwerpen (*245*).

Waterhouse (*248*), Council for Scientific and Industrial Research, Australia, has determined by an indicator method the hydrogen-ion concentration of the digestive tracts of nine species of flies, two of which are abundant in North America. Most portions of the tracts of the larvae were predominantly neutral or alkaline, the range in pH being generally from 7.4 to 8.0. The one exception, the middle portion of the midgut, was definitely acid—pH 3.2 to 3.9. In contrast the tracts of the adult flies were usually acid with a range of pH from 3.5 to 5.3, except for the posterior portion of the midgut which was alkaline—pH 7.8 to 8.0. Staudenmayer (*222*), Horticultural Research Station, Germany, has published perhaps the most comprehensive review of the literature on the hydrogen-ion concentration of the digestive tract and blood of insects. Values are given for 120 species in nine orders of insects. The data are discussed with respect to the toxicity of stomach poisons.

Contact Poisons

Important fundamental studies of the permeability of insect cuticle to toxic and other substances have been published by Hurst (*121*, *122*), Biological Field Station, Imperial College of Science and Technology, England. In the later article Hurst points out that the cuticle of insects possesses a high degree of asymmetry which depends on the association between the external, water-repelling "lipoid layer" and the internal, hydrophile, protein-chitin complex (*240*). This asymmetry affects the permeability of the whole cuticle, and is modified in different insects by the relative distribution and physical properties of the soluble and insoluble substances in the cuticle. An asymmetrical membrane may be more permeable to a particular substance than is a single component of the membrane. The permeability of asymmetrical colloid associations, such as the insect cuticle, is not deducible necessarily from the summation of the permeabilities of the component phases of the associations. Hurst believes the fundamental assumptions concerning the permeability of membranes should be reconsidered. Wigglesworth (*258*), London School of Hygiene and Tropical Medicine, confirms Hurst's earlier work with nontoxic hydrocarbons, and stresses particularly the importance of the partition coefficient of a substance between oil and water in determining the rate at which it leaves the oily component of a contact insecticide to enter the tissues of an insect.

According to a recent paper by Moore *et al.* (*172*), McLaughlin Gormley King Co., a selenium compound, a proprietary material made by dissolving selenium in potassium ammonium sulfide solution, was tested in sprays on the Pacific mite, *Tetranychus pacificus*, and the European red mite, *Paratetranychus pilosus*. Both the mites and their eggs on apple trees were killed, and the trees were not injured by these sprays. Yothers (*266*), Bureau of Entomology and Plant Quarantine, observed that female San Jose scales, *Aspidiotus perniciosus*, were rendered unproductive by lime-sulfur spray from the action of the spray on the reproductive organs of the females or to the death of the males, and more likely to the latter because the males are more susceptible than the females to lime-sulfur spray.

In work on organic contact insecticides, Melvin *et al.* (*167*), Bureau of Entomology and Plant Quarantine, offer a new remedy for treatment of wounds on cattle infested with screwworms, *Cochliomyia americana*, and for protecting wounds from re-infestation. In 1939 (*166*) the discovery was made that diphenylamine repelled the flies and killed the young larvae before they could injure the tissues. The new preparation, superior in its action to diphenylamine alone, is a mixture of diphenylamine, benzene, Turkey red oil, and lampblack. It is applied to the wounds with a brush. A group of amines derived from the fatty acids has been studied for insecticidal action by Ralston *et al.* (*199*), Armour & Co. Of the primary amines, the octyl and decyl compounds gave highest kills of houseflies in a Peet-Grady

TEXAS EXPERIMENT STATION

Adult cotton flea hopper

chamber, but they are too irritating for general use. Dioctylamine was the most active secondary amine, showing marked paralyzing and lethal potency to houseflies. It is not irritating to man or toxic to domestic animals. Trioctylamine, the only tertiary amine tested, possessed weak insecticidal action. Dahm and Kearns (*42*), University of Illinois, tested 22 alkyl secondary amines for toxicity to the housefly. *N*-η-hexyl-η-heptylamine was equal in effectiveness to any compound in the series and superior to any lower member. Straight-chain alkyl secondary amines having identical alkyl groups, or differing by only one CH_2 group, were more toxic than secondary amines in which the alkyl groups differ by a greater number of CH_2 groups. However, the substitution of branched-chain alkyl groups leads to reduced insecticidal effectiveness. Thomssen and Doner (*236*), J. R. Watkins Co., discuss the insecticidal properties of the fatty acids.

Organic dinitro compounds continue to occupy the attention of investigators of insecticides. Stellwaag and Staudenmayer (*224*), Horticultural Research Station, Germany, have studied the mechanism of toxic action of 3,5-dinitro-*o*-cresol (2,4-dinitro-6-methylphenol) on insects. This compound seems to penetrate the lipoidlike surface layer of the cuticle, destroying the underlying cells by precipitation of the proteins. Toxic action on insects and plants is increased in the presence of wetting and adhesive agents. But when used with an oil, the compound will kill the pupae of certain insects in their cocoons without injury to tree buds. Decker and Drake (*47*), Iowa Experiment Station, examined the action of a number of organic nitro compounds in dusts on two-striped grasshoppers, *Melanoplus bivittatus*, Mormon crickets, *Anabrus simplex*, and chinch bugs, *Blissus leucopterus*. Most toxic to the grasshoppers was 3,5-dinitro-*o*-cresol, which also killed chinch bugs but proved less effective on Mormon crickets. 2,4-Dinitro-6-cyclohexylphenol and 2,4-dinitrophenol were less active though still markedly toxic to the grasshoppers.

A recent addition to the nitrophenol insecticides is the dicyclohexylamine salt of 2,4-dinitro-6-cyclohexylphenol. Kagy and McCall (*132*), Citrus Experiment Station, and Boyce and Kagy (*25*) have found this compound to be very toxic to the citrus red mite, *Paratetranychus citri*, the citrus thrips, and some other mites and insects. The salt is nearly as effective as the parent phenol and, because it has a lower vapor pressure, its effectiveness persists for a longer period. It can be used in dusts without injury to citrus foliage. Isely (*125*), University of Arkansas, controlled the red spider, *Tetranychus telarius*, on cotton with a dust which contained 0.05 per cent of 2,4-dinitro-6-cyclohexylphenol in sulfur. In a later paper, Kagy (*131*) reviews the pertinent literature and presents new information on the 2,4-dinitro-6-*R*-phenols as insecticides. 2,4-Dinitrophenol, the derivative in which *R* is hydrogen, is considerably less toxic to insects than 2,4-dinitro-6-methylphenol, in which *R* is a methyl group. When administered as stomach poisons to silkworms, *Bombyx mori*, the toxicity of the derivatives increases with increasing length of the substituted normal alkyl chain up to 6 or 7 carbon atoms. Beyond that point, the substituted compounds decrease in toxicity. All of the 2,4-dinitro-6-*R*-phenols are more toxic to silkworms than acid lead arsenate and less toxic than rotenone, and 2,4-dinitro-6-cyclohexylphenol is more toxic than 2,4-dinitro-6-methylphenol. Because the latter compound is essentially the first member of this series, it can be expected to behave peculiarly in toxic properties. There are indications that the toxicity of these compounds to man stands in reverse order to their toxicity to insects.

A comprehensive study of the action of contact insecticides on *Lucilia cuprina* larvae has been made by Lennox (*144*). Pure liquid aliphatic, halogenated, and aromatic hydrocarbons were markedly toxic. The toxicity of normal aliphatic alcohols and acids increased, within homologous series, with the length of the carbon chain. Isomers of alcohols and acids were less toxic than the corresponding normal compounds. The toxicity of coal-tar fractions increased with the volatility of

the tar acid content. Lipoid solvents were highly toxic, probably owing to a solvent action on the external cuticular layer which facilitates penetration of the solvent through the cuticle.

Three species of fleece worms, larvae of the flies, *Phormia regina*, *Cochliomyia macellaria* and *Lucilia sericata*, are responsible for cutaneous myiasis of sheep in the United States. Knipling (*135*), Bureau of Entomology and Plant Quarantine, tested 30 organic compounds against the larvae of these flies. The 11 most toxic compounds were diphenylsulfoxide, *p*-nitroanisole, azobenzene, diazoaminobenzene, *p*-nitrophenetole, phenothioxin, *m*-dinitrobenzene, *p*-dichlorodiphenyl, hydrazobenzene, *p*-nitrotoluene, and benzeneazodiphenylamine. The first four of these compounds approached sodium arsenite in toxicity to the larvae.

Pierpont (*193*), University of Delaware, uses a terpene ether, ethylene glycol ether of pinene, as an activating agent in pyrethrin–petroleum oil fly sprays. Ark and Tompkins (*9*), University of California, killed red spiders and their eggs with a 2 per cent aqueous solution of phthalic glyceryl alkyd resin. The compound has spreading properties, and at this concentration did not injure the foliage of the sprayed plants.

Trichlorobenzene and *o*-dichlorobenzene were used by Fellton (*73*), Department of Health, New York, to control larvae of aquatic midges, *Procladius* spp., *Chironomus* spp., in lakes on the New York World's Fair grounds. The compounds were sprayed on the surface of the water at 16 to 25 gallons per acre. Trichlorobenzene was the more rapid in toxic effect. Collins (*36*), Bureau of Entomology and Plant Quarantine, finds *o*-dichlorobenzene emulsion with or without petroleum oil useful as an ovicide and repellent spray for the bark beetles, *Scolytus multistriatus* and *Hylurgopinus rufipes*.

Ebeling (*62*), Citrus Experiment Station, proposes a method of determining residues from petroleum-oil sprays on citrus trees which involves absorption with filter paper of the spray from the upper surfaces of sprayed foliage and extraction of the oil from the filter paper. Oil concentration in a petroleum-oil spray bears a linear relation to oil deposit on the foliage. Blood albumin as a spreader tends to decrease oil deposit, while certain electrolytes (calcium chloride, aluminum sulfate) increase the deposit of certain types of oils. McCall and Kagy (*154*) stain the oil spray with Sudan III, extract the oil deposit from the sprayed foliage with light petroleum ether, and determine the deposited oil by comparison with a set of standards made from the same oil. The accuracy of the method is not affected by extracted plant waxes or essential oils. Cole and Smith (*35*), California Experiment Station, use Nile blue sulfate for differentiating the oil droplets from the dispersing medium of an oil-in-water emulsion. Pearce *et al.* (*188*) determine the deposition of oil by dormant sprays on the bark of apple trees by extracting with petroleum ether carefully sampled lots of sprayed twigs which have been cut into convenient lengths. Net weight of the extracted oil residue is obtained by correcting for the amount of residue extracted from unsprayed twigs. This method is used by the same authors (*31*) in a study of the factors that influence the deposition of petroleum oil on apple trees in dormant spraying. The primary factors are concentration of oil in the spray mixture, kind and amount of emulsifier–wetting agent, and the quantity of spray applied per tree. Oil concentration and oil deposition are correlated when the same emulsifier is used, but there may be little relation between concentration and deposition when the emulsifiers are different. If the first spray is allowed to dry before a second spray is applied, the oil deposit from the later spray shows nearly a twofold increase. Oil deposit and toxicity to eggs of the fruit tree leaf roller, *Cacoecia argyrospila*, are definitely correlated (*32*).

The effect of petroleum-oil sprays on the chemical composition of the juice of citrus fruits is the subject of an extensive investigation in California reported this year by Sinclair *et al.* (*212*), Citrus Experiment Station. Washington navel and Valencia oranges were obtained from orchards located in widely separated areas of the citrus-growing regions involving many different soil types and climatic conditions. The trees from which the fruit was taken were sprayed with light-medium oils of 70° viscosity, 92 per cent of unsulfonatable residue, and distillation range of 50 to 65 per cent at 636° F. The oil concentrations of the sprays ranged from 0.25 to 1.75 per cent. Within these limits of concentration, all sprays reduced the total soluble solids, the reducing sugars, and the total sugars of the juice, but the changes were slight after spraying with oil concentrations that ranged from 0.75 to 1.75 per cent. Titrable acidity was changed slightly, and the pH but little because the juice is highly buffered.

TEXAS EXPERIMENT STATION

Cotton bollworm feeding on boll

Worthley (*263*), Pennsylvania State College, investigated the relation of the physical properties of lubricating type oil to toxicity, using as the experimental insect, the larger milkweed bug, *Oncopeltus fasciatus*. The oils were applied directly to the insects, dosage being proportional to unit area of body surface rather than to body weight or to the single insect. Toxicity of the lubricating oil fractions decreased with increase in viscosity, it was not correlated with the density or the index of refraction of the oils, and there was no significant difference in toxicity with respect to sex of the insects.

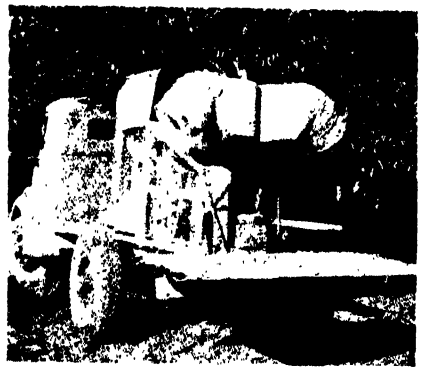
According to Watson (*249*), Cambridge University, petroleum oils affect mosquito larvae in several ways. They may adhere to the body hairs and so interfere with the balance of the larvae; the movements of the feeding brushes may be obstructed by the oil, resulting in starvation of the larvae; certain oils are directly poisonous, acting on the muscle tissue and causing paralysis. All of the oils examined were able to penetrate the outer cuticle of the larvae, and they also entered the tracheae, interfering with moulting and affecting the heart. The potency of an oil is related to its ability to spread upon a water surface, but if the oil layer is of unimolecular thinness, the oil may fail to enter the respiratory siphon. Richards (*201*), University of Pennsylvania, finds that toxic (volatile) petroleum oils cause extensive degeneration of the nervous tissue of mosquito larvae, *Culex pipiens*, and all oils, whether of the toxic or nontoxic type, produce the histological effects of suffocation, *i. e.*, a clumping of the chromatin especially in the cells of the central nervous system. The same histological effects were observed in larvae asphyxiated in water of low oxygen tension.

Hansberry (*105*) compared rapeseed oil with petroleum oil, both supplemented with nicotine compounds, in sprays for controlling the codling moth. The rapeseed oil proved inferior for this purpose.

Specifications and methods of analysis for tar-oil dormant (winter) sprays are presented by Gimingham *et al.* (*90*), British Ministry of Agriculture and Fisheries. The specifications refer to single-phase or polyphase products compounded from distillates from retort or coke-oven tars. Miscible tar-oil sprays shall contain not less than 80 per cent total oil, not less than 52 per cent tar oil soluble in dimethyl sulfate, and not more than 10 per cent of phenols. At least 40 per cent of

the neutral oil from dimethyl sulfate shall distill above 230° C., 22 per cent above 290° C., and 10 per cent above 335° C. Specifications are also given for stock emulsion tar-oil sprays, and the methods of analysis for both types of sprays are detailed.

Control of Termites and Other Wood-Infesting Insects



A new soil insecticide for termites, phthalonitrile, is announced by Swingle *et al.* (*233*). Concentrations down to 1 to 3,000 parts of soil, killed *Reticulotermes* sp. in 24 to 48 hours. Concentrations of 1:4,000 and 1:5,000 killed 93 per cent of the insects in three days.

Some years ago, the Bureau of Entomology and Plant Quarantine built a test house on Barro Colorado Island, Canal Zone, to determine the resistance of building materials to termites and decay organisms under severe tropical conditions. A report on the condition of this house as of August 1940 has been published by Snyder and Zetek (*217*). Timbers impregnated with standard wood preservatives (coal-tar creosote, zinc chloride) withstood the attack of termites from 1926 until 1940. However, the termites succeeded in constructing shelter tubes over the treated timbers and so reached and damaged untreated materials inside the house. Incorporation of phenol formaldehyde resins in plywood (*4*), produced a material with promising termite-resistant properties. Turner (*242*), Connecticut Experiment Station, discusses the control of termites. Cann (*28*) reviews the recent work in Great Britain, Australia and the United States on preventing *Lyctus* beetle attack on wood by chemical agents

Plant Insecticides

Pyrethrum. LaForge and Acree (*139*), Bureau of Entomology and Plant Quarantine, offer a new method for the quantitative determination of pyrethrins I and II. The pyrethrins are hydrogenated with palladium as catalyst, yielding hexahydropyrethrone and the corresponding acids of pyrethrins I and II. The monocarboxylic acid of I is steam distilled from the acidulated, fatty acid-free filtrate and titrated with weak sodium hydroxide solution. The dicarboxylic acid of II is removed from the residual filtrate by ether, extracted with a slight excess of sodium hydroxide, and back titrated with weak acid. The method is said to be rapid and accurate. Yip (*265*), University of California, describes a simple and inexpensive apparatus for extracting pyrethrin I from pyrethrum flowers with petroleum ether which reduces loss of solvent by evaporation. Martin (*164*), Rothamstead Experimental Station, England, obtains colorless concentrates of the pyrethrins by extracting with petroleum ether ground pyrethrum which has been mixed with fresh decolorizing carbon. Pyrethrin II seems to be held more tenaciously by the carbon than pyrethrin I. Harts *et al.* (*109*), John Powell and Co., in a comparative study of the Seil and mercury reduction methods for pyrethrin determination, obtained consistently lower results with the mercury reduction method for both ground pyrethrum flowers and pyrethrum extracts. Nagase (*174, 175*), Taihoku Imperial University, Taiwan, has studied the products of combustion and of destructive distillation of pyrethrum, reporting among the former neutral, phenolic, acidic, and basic substances. The neutral substances predominate and show greatest toxicity to the pomace fly, *Drosophila ampelophila*. Destructive distillation yielded butyric acid, isovaleric acid, an unknown acid, acetaldehyde, propionic aldehyde, and butyric aldehyde. Covello (*37*) finds that sulfur dioxide inhibits the activity of the oxidase responsible for the loss of pyrethrins during the drying of pyrethrum flowers.

The relative toxicity of pyrethrins I and II to insects is still a matter of interest. The toxic action of the pyrethrins in kerosene on the American cockroach is the subject of a paper by McGovran *et al.* (*157*), Bureau of Entomology and Plant Quarantine. Solutions rich in pyrethrin II caused more rapid paralysis affecting a greater proportion of the insects than solutions rich in pyrethrin I. Yet mortality within levels of 17 to 77 per cent was greater from solutions of high pyrethrin I content, though more concentrated solutions produced higher and almost identical mortalities. Female cockroaches were about twice as resistant as the males to the action of the pyrethrins. The effect of pyrethrum on the spiracular mechanism of insects has been studied by Wigglesworth (*259*) who confirms the destructive action of pyrethrins on the central nervous system. Wigglesworth's experiments also show that desiccation of insects poisoned by pyrethrins is not the main cause of their death. Newly emerged blowflies, *Phormia regina*, with thin, soft cuticles proved more resistant to pyrethrins, contrary to expectation, than older insects with hardened and thickened cuticles (*1*).

CITRUS EXPERIMENT STATION, RIVERSIDE, CALIF.

Rear view of walnut duster

There are a number of references to pyrethrum–petroleum oil larvicides for mosquito control in the 1941 literature. Mentzer *et al.* (*168*), University of Delaware, modified the New Jersey mosquito larvicide (*91*) by substituting a fuel oil for kerosene and adding pine oil, ethylene glycol ether of pinene, or fenchyl thiocyanoacetate. These substances increased the toxicity of the standard larvicide, but a mixture which contained 50 per cent of the standard proportion of pyrethrum and 5 per cent of ethylene glycol ether of pinene, diluted 1:10, proved most satisfactory. Yates and Stage (*264*), Bureau of Entomology and Plant Quarantine, have attempted to improve the New Jersey larvicide. Trials were made with a group of emulsifiers, oils, and activators. Several organic wetting agents produced pyrethrum-oil emulsions that compared favorably with the standard New Jersey preparation. Diesel and stove oil performed no better than kerosene in this preparation and, while 5 per cent of sesame oil or of amyl acetate increased moderately the toxicity of the preparation, these additions do not seem justified economically. Effects of storage, of debris, and of temperature on the effectiveness of these emulsions are considered. The same authors (*221*) have dealt with the resistance to larvicides of several species of mosquitoes. Petroleum oils, pyrethrum-oil emulsions, Paris green, and phenothiazine were included in this study. Some marked differences were revealed. Ginsburg (*92*) brings up to date existing knowledge of mosquito oils and larvicides, and mosquito control is treated in a paper by Bishopp and Webb (*15*), Bureau of Entomology and Plant Quarantine.

A pyrethrum-oil preparation was more effective than petroleum oil alone for controlling the cornsilk fly, *Euxesta stigmatias*, a pest of sweet corn in Puerto Rico, according to Bailey (*11*), Puerto Rico Experiment Station.

According to Skaptason and Blodgett (*213*), Cornell University, pyrethrum insecticides reduce the effectiveness of cuprous oxide for the fungus organism of potato, *Phytophthora infestans*.

An important medical use of pyrethrum for controlling lice on man is indicated by the work of Angevine (*2*), Board of Public Welfare, District of Columbia. Martin and Hester (*165*), Rothamsted Experimental Station, England, find that the causal agent of human dermatitis in pyrethrum is located in the lower part of the flower head. It is soluble in petroleum ether and is present in the volatile oil obtained by steam distillation of the flowers. Apparently the pyrethrins are not concerned in pyrethrum dermatitis.

Cultivation and harvesting of pyrethrum is treated in a bulletin by Sievers *et al.* (*211*), U. S. Department of Agriculture, who believe a modified cotton stripper offers the mechanical principles of a successful machine for harvesting pyreth-

rum flowers. A machine-harvested crop met adequate standards with respect to insecticidal properties.

Rotenone and Rotenoids. The quality of rotenone-bearing plants is based on the content of rotenone and total extractive material. The rotenone content has definite insecticidal significance, but the toxic action of the extractive substances may vary with the source of the plant material. Goodhue and Sullivan (*97*), Bureau of Entomology and Plant Quarantine, have studied the toxicity to the adult housefly of the noncrystalline extractive material from the roots of *Tephrosia virginiana*. Starting with the residue from a chloroform extract of the roots, taken up in ether and freed of rotenone, they obtained by alkali extraction an alkali-soluble fraction and an alkali-insoluble resin. The resin was divided into a neutral resin fraction and an oil. The fraction which contained the neutral resin and comprised about 50 per cent of the total extractives of the roots was toxic to the housefly. The alkali-soluble fraction which made up 9 per cent and the oil 23 per cent of the total extractives were nontoxic. These two nontoxic portions of the total extractives should be considered in evaluating the roots on the basis of total extractive content. Jones and Wood (*130*) and Jones (*128*), Bureau of Entomology and Plant Quarantine, find that soft glass, owing to its alkalinity, lowers markedly the melting points of α-toxicarol and of rotenone. Only glass of low alkalinity is suitable for melting point determinations of these compounds. A study of the photochemical decomposition of rotenone by Ts'ai and Ke (*241*), Yenching University, China, revealed that oxygen does not decompose rotenone in the dark, but in the light a marked decomposition takes place. Strangely, the presence of oxygen does not seem to have an appreciable effect on the decomposition of the rotenone in the light.

Woke (*262*) fed rotenone to larvae of the southern armyworm. The larvae were not killed and on microscopical examination of the epithelial cells and tissues of the midgut appeared normal. Some new or otherwise noteworthy insecticidal uses of rotenone-bearing materials appear in the 1941 literature. Progress in the development of a kerosene-rotenone spray for red scale in California is shown by Quayle (*196*), Citrus Experiment Station, and by McBeth and Allison (*153*), Leffingwell Ranch, Whittier, Calif. Steiner and Worthley (*223*), Pennsylvania Experiment Station, have developed a petroleum-oil emulsion containing cube powder for the control of the pistol casebearer, *Coleophora malivorella*, on apple. McGarr (*156*), Bureau of Entomology and Plant Quarantine, uses derris in calcium arsenate dust for the cotton aphid. Johnson and Friend (*127*), Connecticut Experiment Station, report encouraging results with derris for controlling mound-building ants, *Formica exsectoides*. Eckert (*64*), University of California, Berkeley obtains favorable results for the control of the Argentine ant, *Iridomyrmex humilis*. On the contrary, Hackley (*102*) states that the action of derris on ants is variable. Goetsch (*93*) University of Breslau, Germany, gives information on the control of ant colonies and the composition of ant baits. Fulton and Nelson (*80*), Bureau of Entomology and Plant Quarantine, show that Bordeaux mixture is reasonably compatible with ground cube root and that a mixture of the two is suitable as a spray for the Mexican bean beetle. Spencer (*219*), University of British Columbia, recommends derris powder, dusted and rubbed into underwear and seams of uniforms, in place of older remedies for control of body lice on troops in the field. Roark (*203*), Bureau of Entomology and Plant Quarantine, reviews the more recent literature on rotenone and the rotenoids with special emphasis on work done in the United States.

TEXAS EXPERIMENT STATION

Cotton leafworm

Nicotine. Distribution of nicotine and some of its compounds between water and vegetable oil has received the attention of Norton (*180*), New York Experiment Station. The purpose was to ascertain the stability of nicotine-oil preparations for insecticidal sprays. Most vegetable oils, particularly those with free alcohol groups (pine oil, castor oil), hold more nicotine than petroleum oils. Nicotine compounds are not so favorably distributed between water and oil as free nicotine, but they tend to shift less toward the water phase with increasing concentration. Judged solely on the basis of distribution, the advantage shown by vegetable oils over petroleum oils is too small to be of practical significance. Norton *et al.* (*181*) also determined the partial pressure of nicotine solutions at 25° C. With increasing nicotine concentration, loss of nicotine relative to water at first increases rapidly, then remains nearly constant over a considerable range of concentrations, and finally increases rapidly again. Norton and Billings (*182*) present a study of the residues from sprays containing soluble nicotine, nicotine-oil preparations, and fixed nicotines. The most rapid loss of nicotine occurs during the drying of the spray. The loss is greatest for the soluble nicotines and least for the fixed nicotine preparations. Deposits of nicotine oleate and nicotine pectate are smaller and are lost more rapidly than those of nicotine sulfate because of the greater run off and, probably, lower chemical stability.

An investigation reported by Dawson (*44*), University of Missouri, indicates that nicotine is synthesized largely in the roots of the tobacco plant and moves from the roots to the leaves principally through the xylem.

Babers (*10*), Bureau of Entomology and Plant Quarantine, observed no change in the pH of the blood of southern armyworms which were held in an atmosphere of nicotine vapor, although the larvae absorbed considerable nicotine. Apple (*7*), Iowa State College, studied the effect of sodium and calcium chloride on the toxicity of nicotine to eggs of the housefly. The experiments showed an increased toxic activity of nicotine in the presence of sodium chloride, while calcium chloride exerted an antagonistic influence on the nicotine. The effect is probably the result of changed rate of nicotine permeability in the presence of the salt ions. Hansberry and Norton (*106*) tested a group of nicotine compounds in sprays against the bean aphid, *Aphis rumicis*. Nicotine laurate, oleate, linoleate, stearate, and naphthenate were most toxic, and in effectiveness they equaled approximately free nicotine in sodium oleate solution. Compounds with poor spreading properties (nicotine caseinate), compounds like dodecyl nicotinium iodide, and some nicotine double salts containing copper, tin, and zinc were less toxic, while insoluble nicotine compounds possessed little toxicity. Nicotine combinations with fatty and naphthenic acids owe their insecticidal effectiveness to the combined action of alkaloid and acid, to the improved wetting and spreading properties of their solutions, and to an unknown activating or synergistic action. A dust mixture of nicotine tannate, nicotine bentonite, and an inert carrier was more effective than rotenone dusts for controlling the European corn borer, *Pyrausta nubilalis*, on sweet corn, according to Turner (*243*). Fahey (*67*) studied bentonite clays from various sources with respect to their suitability for preparing tank-mixed nicotine-bentonite sprays. Clays that removed a large percentage of nicotine from solution generally swelled when wet with water and were flocculated from water by addition of nicotine sulfate. One clay sample, from Mississippi, behaved exceptionally

in removing most of the nicotine from solution, yet it did not swell in water and was not flocculated by nicotine sulfate. Clays which were flocculated by nicotine sulfate yielded blotchy spray residues with superior weather-resisting properties. High mortality of the pea aphid, *Illinoia pisi*, was obtained by Ditman *et al.* (*53*), Maryland Experiment Station, by the application of nicotine vapor with a vaporizer. A machine called the vapo-fumer, used to "gas" vegetable crops with nicotine vapor, is described by Nicholson (*179*).

Anabasine, an alkaloid related chemically to nicotine, has been used in mist form for controlling mosquitoes by Pogodina and Sokolov (*194*), and is the subject of an exhaustive review by Roark (*204*) who summarizes the chemistry, occurrence, pharmacology, insecticidal uses, patents, and literature.

Other Plant Insecticides. Recently introduced into the United States from China, where it has long been grown and used to protect vegetables from insect attack, the "Thunder God vine", *Tripterygium wilfordii* (family Celastraceae), has interesting possibilities as a stomach poison. W. T. Swingle *et al.* (*235*), U. S. Department of Agriculture, working with the pulverized fresh root from plants grown in the United States, demonstrated marked toxicity to young larvae of the diamondback moth, *Plutella maculipennis*, and the imported cabbage worm, *Pieris rapae*. To some other insect larvae, the powder gave low to almost no mortality. The chemical nature of the toxic substance in the powder is under investigation. Hwang (*123*) states that the insecticidal compound in this plant is an alkaloid ($C_{28}H_{33}O_{11}N$) to which the name tripterygine has been given. He obtained 2.4 grams of the alkaloid from 3 kg. of the roots.

Stultz and Patterson (*225*), Dominion Entomological Laboratory, Royal, N. S., examined for toxicity the alkaloids, tetrahydropolmatin, protopine, dicentrine, and corydine hydrochlorides, and the hydrochlorides of the total amorphous alkaloids from *Lobelia inflata*, *Menispermum canadense*, and *Delphinium brownii*. The alkaloids of *D. brownii* appeared most promising. They were less toxic than nicotine sulfate as contact poisons for aphids, but as stomach poisons and repellents for some other insects they were more effective. Spray residues of the alkaloids appear to lose their insecticidal potency more rapidly than those of nicotine sulfate. Colchicine, an alkaloid related to morphine and obtained from *Colchicum autumnale*, has been studied by Dooley (*55*), Prairie View State College, Texas, with respect to its influence on the germ cells of Orthoptera. The testes cells of the cricket, *Gryllus assimilis*, and those of the entire insect are more sensitive to injected solutions of colchicine than the corresponding cells of the differential grasshopper, *Melanoplus differentialis*. Colchicine prevents division of the sperm cells of these insects without inhibiting their differentiation.

The fruit of the Amur cork or velvet tree, *Phellodendron* spp., a native plant of Amurland, contains a substance with insecticidal properties. Haller (*103*), Bureau of Entomology and Plant Quarantine, tested the residue after removal of the volatile oil on larvae of the mosquito, housefly, and codling moth, to all of which it was toxic. The action of the toxic substance is rapid, like that of pyrethrum and nicotine. Apple and Howard (*8*), Bureau of Entomology and Plant Quarantine, report dusts made from nuts of the California buckeye, *Aesculus californica*, as rather mildly toxic to the Mexican bean beetle.

A survey of plant products for insecticidal properties has been made by Hartzell and Wilcoxon (*110*), Boyce Thompson Institute for Plant Research. Of 150 species and varieties tested on larvae of the mosquito, *Culex quinquefasciatus*, 36 species produced mortalities of 50 to 100 per cent. Among these, 18 plant products, all sources of botanical drugs, killed from 90 to 100 per cent of the larvae. These products are balm of Gilead buds, caraway seed, echinacea root, elecampane root, hydrangea root, male fern rhizome, black mustard seed, pepo (pumpkin seed), sage root, oils of bay leaves, cubebs, cypress, patchouli, rosemary, santal, sweet basil, sweet majoram, and chenopodium. Several of these products are well-known anthelmintics. A steam distillate of elecampane was distinctly toxic to *Aphis rumicis*. Neither ricin, ricinin, crushed castor-bean seed, nor the foliage of castor-bean plants were toxic to the grasshopper, *Melanoplus differentialis* (*218*).

Wetting, Spreading, and Adhesion of Sprays

Several contributions to the wetting, spreading, and adhesive properties of sprays are noted in the recent literature. McKenna and Hartzell (*160*), Boyce Thompson Institute for Plant Research, used 34 wetting and spreading agents in lead arsenate sprays against the Japanese beetle. Ultroil, a proprietary material consisting of a sulfated castor oil with a relatively large percentage of combined SO_3, was most satisfactory for control of the beetle. It left no visible residue and caused no injury to the 48 species of plants sprayed with it. Garman and Shepard (*89*) propose the following spray mixture as a substitute for the western "dynamite spray" for codling moth control—aluminum acetoborate 1 pound, benzoic acid 0.25 pound, white mineral oil 1 quart, lead arsenate 1.5 pounds, and water 50 gallons. Results of experiments in Iowa (*99*) show that soybean flour adds or detracts nothing from the effectiveness of lead arsenate and calcium arsenate sprays for controlling the codling moth. Knipling (*136*), Bureau of Entomology and Plant Quarantine, recommends beet molasses as a dispersing agent for phenothiazine. Fassig and Pierpont (*72*), University of Delaware, find the potassium soaps of wood resin and resin residue equal to potassium oleate as a spreader for nicotine but less effective for derris, while none of the soaps was an effective spreader for pyrethrum extract. A resin–mineral oil emulsion, useful as a sticker for agricultural insecticides, is described by Chisholm (*33*), Bureau of Entomology and Plant Quarantine. Several commercial wetting agents for arsenical sheep dips decrease the retention of arsenic by the fleece, affording poor protection against sheep maggots, according to Hobson (*116*). Roth and Pyenson (*206*), Atlas Powder Co. and New York State Institute of Applied Agriculture, find in mannitan monolaurate a valuable wetting and spreading agent in rotenone and pyrethrum sprays for aphids and certain other insects and in preparations for control of the corn earworm.

The effect of reducing the surface tension of water on mosquito pupae is described by Manzelli (*165*), Rutgers University. Materials which reduce the surface tension of water may have a deleterious effect on

TOBACCO BY-PRODUCTS AND CHEMICAL CORP.

Vapo-fumer in action—applying nicotine vapor to vegetable crops

all stages of the mosquito. The female, alighting on the water to deposit her eggs, cannot support herself if the surface tension is too low and, even if she succeeds in ovipositing, the eggs will sink and the embryos drown. But if the eggs are laid and they hatch, the young larvae will be killed by the combined effect of reduced surface tension and toxicity because most substances that reduce surface tension are, in some degree, toxic. Finally, and this is the subject of Manzelli's paper, the pupae lose their equilibrium in water of low surface tension. This happens as a consequence of the position of the center of buoyancy of the pupae which lies between the tips of the two breathing trumpets. Normally the tips of the trumpets are maintained at the surface by the tension of the surface film. If the tension becomes too low, the trumpets can no longer hold to the film, and the pupae turn over on their sides and die. Substances that reduce surface tension are suitable for controlling the breeding of mosquitoes in barrels, dye vats, and similar receptacles. In such places a neutral wetting agent will probably serve better than a soap. Cupples (*40*), Bureau of Entomology and Plant Quarantine, sprayed rotating apples with aqueous solutions of various wetting power as measured by their spreading coefficients on mineral oil. Retention of the spray mixtures was determined at the point of run-off from the apples. There was a close relationship between the spreading coefficients of the solutions and relative retention of the spray by the apples. Cupples suggests that the spreading coefficients of aqueous spray solutions on a reference mineral oil may be used to determine the wetting properties of aqueous sprays.

Fumigants

A striking example of change in the characteristics of an insect population brought about by application of insecticides over a period of years is afforded by development of a resistant strain of the California red scale, *Aonidiella aurantii*. This subject is discussed in a penetrating article on racial segregation in insect populations by H. S. Smith (*216*), Citrus Experiment Station. In an endeavor to reduce the scale populations to safe levels, orchardists have created strains of red scale so resistant to hydrogen cyanide that they can no longer be held in check by the older methods of fumigation. Dickson (*52*), working at the same station, shows that this resistance is inherited, that it depends on a single gene or a group or closely linked genes in the X-chromosome of the insects, and is sex-linked. Scale populations which were formerly controlled by hydrogen cyanide fumigation probably contained individuals in which this factor for resistance was present. The use of hydrogen cyanide from year to year in the citrus orchards of California has gradually increased the proportion of resistant individuals, and the proportion will continue to increase until a nearly pure strain of resistant insects is established. Hardman and Craig (*107*), University of California, Berkeley, have established a physiological basis for the resistance of the two strains of red scale. In the presence of hydrogen cyanide, the spiracles of the resistant strain remain closed for at least 30 minutes, while under the same conditions the spiracles of the nonresistant strain are closed for about one minute only after which they open and death of the insects follows, if the cyanide concentration is lethal. Swain and Buckner (*230*), du Pont company, consider hydrogen cyanide the most satisfactory compound for controlling red scale, notwithstanding the difficulties presented by resistant strains. Dosages, however, should be higher than those currently used, and on lemons the higher doses should be applied during the winter months only. In two papers Lindgren (*149*, *150*), Citrus Experiment Station, discusses the relative merits of high peak and low, uniform dosage, time, temperature, and other factors concerned in the use of hydrogen cyanide for citrus fumigation. Lindgren and Dickson (*151*), have also studied the susceptibility to hydrogen cyanide of the purple scale, *Lepidosaphes beckii*. This insect is most susceptible in the immature crawler stage and most resistant in the first half of the egg stage. Studies by Sinclair *et al.* (*212*) of the effect of hydrogen cyanide on the chemical composition of the juice of fumigated oranges revealed no effect from either fall or winter fumigation.

Experiments recently made by Livingstone and Reed (*152*), Bureau of Entomology and Plant Quarantine, show that revival of cigarette beetle larvae, *Lasioderma serricorne*, from hydrogen cyanide fumigation reaches a peak several days after the insects are removed from the gas when a decline sets in. Percentage of mortality should be determined on the day maximum revival occurs.

Winkler (*261*), U. S. Food and Drug Administration, reports on several chemical methods of determining hydrogen cyanide residues in fumigated foods. A thiocyanate method and a phenophthalein method, both colorimetric, are discussed and their advantages and disadvantages are pointed out.

In spite of its combustible nature, carbon disulfide continues to be used as an insect fumigant. The U. S. Public Health Service (*5*) considers the potential dangers of carbon disulfide and its toxicity to human beings. For continued exposure the permissible limit of concentration is reported as 20 parts per million parts of air. Thirty parts per million are likely to produce toxic effects. McKee (*159*), Harvard School of Public Health, describes a quantitative microchemical colorimetric test for carbon disulfide in air, water, and biological fluids. White and Calvert (*256*), American Viscose Corp., describe an automatic recorder for the determination of carbon disulfide in room air.

Hamilton (*104*), New Jersey Experiment Station, contributes an interesting article on the toxicity of methyl bromide to the red spider on greenhouse roses. Percentage mortality and plant tolerance within the temperature range of the experiments were essentially products of concentration and exposure time. The margin of safety between plant tolerance and mortality of the red spider was lower at the lower temperatures, and a concentration of methyl bromide that killed 100 per cent of the red spiders injured the most susceptible of the rose varieties used in the experiments. A discussion of the hazards associated with the use of methyl bromide as a fumigant is presented in *Pests* (*3*), and the danger from methyl bromide residues in foodstuffs is discussed by Dudley *et al.* (*56*), who state that the small quantities of methyl bromide and bromine residues in fumigated products are not likely to be harmful to the consumer.

The Bureau of Entomology and Plant Quarantine presents a number of articles on aerosols for the control of insects. Sullivan *et al.* (*229*) sprayed a solution of naphthalene in *o*-dichlorobenzene on a surface heated to 375° C. The resulting aerosol killed houseflies in 24 hours, but required a longer time to kill adult cockroaches, *Periplaneta americana*. Aerosols volatilized in this manner are relatively nontoxic to man and nonflammable. They have considerable penetrating power and are very irritating to insects, driving them out of cracks and crevices. They can be produced at low cost. Their chief disadvantages are unpleasant odor, injury to plants, and the necessity of limiting their use to enclosed spaces. Sullivan *et al.* (*228*) vaporized naphthalene alone and in the presence of a burning mixture of cornstarch and sodium nitrate. The period of dispersion of the naphthalene was greatly lengthened in the presence of smoke. Apparently the naphthalene is adsorbed on the smoke particles and tends to be deposited uniformly on surfaces. Naphthalene aerosols produced higher mortality of houseflies than naphthalene vapor, and mortality was greater in covered than in uncovered cages. In another paper, Sullivan *et al.* (*227*) describe aerosols produced by spraying mixtures of lauric or oleic acids and *o*-dichlorobenzene on heated surfaces (375° C.). Aerosols from the mixtures were more toxic than those produced by the components of the mixtures. Some other fatty acid derivatives gave similar results. Goodhue and Sullivan (*98*) present a general discussion of insecticidal smokes for controlling insects.

Gunderson (*101*), Iowa Experiment Station, added concentrations of ethyl

ether, which were themselves sublethal to the confused flour beetle, *Tribolium confusum*, to concentrations of carbon disulfide, carbon tetrachloride, and ethyl acetate, known to be lethal for this insect. In mixtures containing carbon disulfide or carbon tetrachloride, ether exerted a synergistic effect on toxicity, while the addition of ether to ethyl acetate resulted in an antagonistic action.

Some new or little used fumigants have lately received the attention of investigators. O'Kane and Smith (*185*), New Hampshire Experiment Station, introduce 1,1-dichloro-1-nitroethane (Ethide), a colorless liquid of specific gravity 1.4153 at 20° C. and boiling point of 124° C., which appears to offer a favorable combination of properties with respect to penetration, flammability, toxicity to insects, and safety for practical use as a fumigant. Peters (*192*) describes the use of trichloroacetonitrile as a fumigant. The compound, a liquid, is nonflammable, noncorrosive, and easily volatilized. Hymas (*124*) discusses the use of β-methallyl chloride ($CH_2{:}C(CH_3)CH_2Cl$) as a fumigant, a use for which it was indicated earlier by Briejèr (*26*). Thorp (*237*) killed adult flour weevils (species not given) by passing air which contained impure ozone (47 per cent oxides of nitrogen, 53 per cent ozone) through flour for 30 minutes.

A new use for mercurous chloride is suggested by Hobson (*117*), who finds this compound toxic to the eggs of the sheep maggot fly, *Lucilia sericata*, when infested sheep are dusted with the solid compound or dipped in dilute solutions of it. The toxic substance is probably mercury vapor, various substances in the wool appearing to "activate" the mercurous chloride. The author believes mercurous chloride will be valuable in protective dusts and maggot dressings for sheep.

Many soil insecticides probably act on insects as respiratory poisons. Some, however, may act as contact or stomach poisons. In most cases their action is unknown or obscure, but for convenience they are included here with the fumigants. Breakey *et al.* (*24*), West Washington Experiment Station, applied calcium cyanamide to the soil for controlling pear thrips, *Taeniothrips inconsequens*, a pest of prunes in Washington State. Applications of 100 pounds of pulverized, oiled calcium cyanamide per acre reduced the thrips populations and controlled brown-rot fungus, *Sclerotinia fructicola*, besides furnishing nitrogen to the soil. Neu (*178*), University of Bonn, Germany, attempted to control larvae of the cockchafer, *Melolontha melolontha*, in the soil through applications of calcium fertilizers. Only very large amounts of such fertilizers as kainit reduced the number of larvae, amounts that were dangerous to plants. Lane (*140*), Bureau of Entomology and Plant Quarantine, discusses the practical use of carbon disulfide and naphthalene for the control of wireworms (Elateridae) on irrigated lands.

The woolly apple aphid, *Eriosoma lanigerum*, is a destructive pest of young apple trees in nurseries, and the root infesting form of the insect is difficult to reach and destroy with insecticides. Underhill and Cox (*244*), Virginia Experiment Station, applied carbon disulfide emulsion, diluted 1:1,600, and bis β-chloroethyl ether in water, diluted 1:800, to control this insect. One gallon of either insecticide applied to the loosened soil about the roots of the trees, gave good results in moist or dry soil. C. F. Smith (*214*), North Carolina Experiment Station, believes a slightly alkaline aqueous solution of sodium cyanide is more effective than carbon disulfide or bis β-chloroethyl ether. The dosage is 0.2 to 1.0 gram of sodium cyanide dissolved in 1 quart of water per tree. Dominic (*54*), Virginia Experiment Station, applied bis β-chloroethyl ether to control the tobacco flea beetle, *Epitrix parvula*, in abandoned tobacco seed beds.

Attractants and Repellents

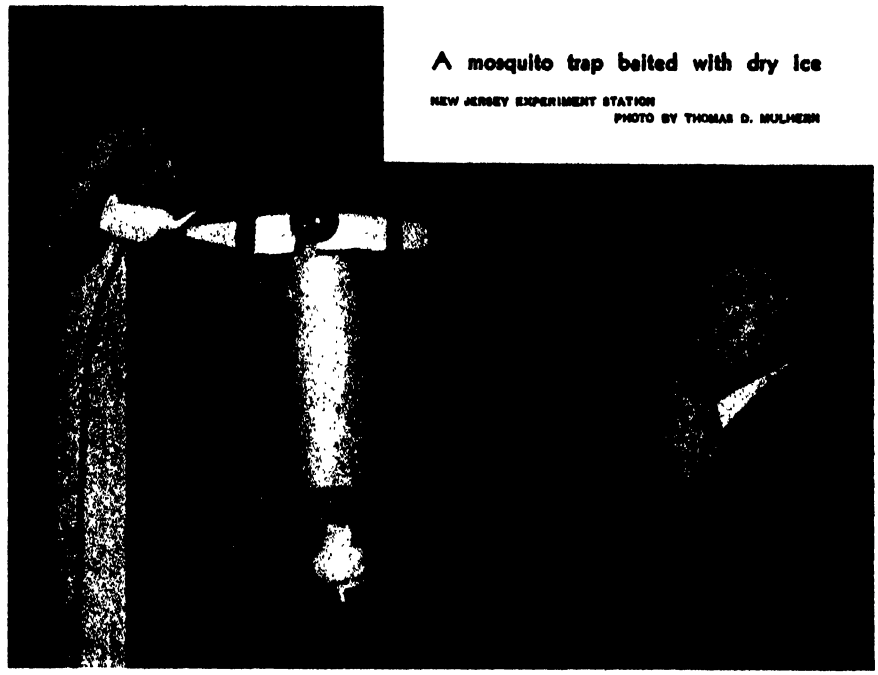
The factors which determine the attracting and repelling characteristics of plants for insects are discussed in an important contribution by Dethier (*49*), John Carroll University. Dethier has studied the lepidopterous genus *Papilio* (swallowtailed butterflies), and he considers the factors operating in the selection of food by these larvae as primarily repellent and attractant in nature. Repellent factors, he says, are frequently physical, as for example the toughness or pubescense of foliage, but they may be chemical. Attractant factors, on the other hand, are entirely chemical. The larvae of many papilios feed on plants of the parsley family (Umbelliferae) whose characteristic odors are imparted by compounds found in certain essential oils (methyl chavicol, anethole, carvone, coriandrol, sedanolid). Experiments demonstrate that species which feed on the Umbelliferae are attracted by these compounds. Originally these insects fed on plants of the rue family (Rutaceae), and the transition to the Umbelliferae took place owing to the presence of identical attractant compounds in both families of plants. The present distribution of the genus *Papilio* is related, in part, to the distribution of its host plants.

According to Crombie (*39*), Cambridge University, the lesser grain borer, *Rhizopertha dominica*, relies chiefly on the sense of smell in reaching an environment where food is present. But once within an environment permeated with the odor of food, the sense of touch becomes paramount in the selection of a site for egg-laying, *i. e.*, a certain pattern of stimuli, involving both olfactory and tactile sensations, is necessary to induce the actual deposition of eggs. Most important is the discovery by Crombie that *Rhizopertha* can be conditioned to the odor of oil of peppermint, a substance which it normally shuns, so that the insect becomes attracted to the once repugnant odor. The conditioned effect wears off after 10 to 14 days by isolating the insect from the odor-permeated environment. In this fashion, the insect comes to associate the new odor with an environment optimum for its life. Olfactory conditioning of several other species of insects has been accomplished by Thorpe (*238*, *239*).

A similar kind of association has recently been demonstrated in the blowfly, *Cynomyia cadaverina*, by Frings (*79*), University of Minnesota. Adult blowflies were exposed to the odor of coumarin while their tarsal taste organs were held intact with a sugar solution. After a training period, most of the flies gave the feeding response (extension of the mouth parts) when they were exposed to coumarin odor. The conditioned flies continued to associate the odor with food even after various operations on the antennae and labrum and after certain parts of the body were coated with lacquer. These conditioning studies help to explain why insects sometimes change from an accustomed to an entirely new food, and they extend our knowledge of the basis upon which rests the practical use of attractants and repellents for insect control.

Attractive baits are used in apple orchards to ascertain from the number of moths caught in traps the correct time for the application of cover sprays. Eyer and Medler (*66*), New Mexico Experiment Station, have published the results of an important investigation on this subject. Dilute cane sirup fermented by certain bacteria (*Aerobacter*, *Aerobacillus*) proved more attractive to codling moths than sirup which was contaminated with yeast, mold, and bacteria from the air. Tests with a large number of compounds, products of the bacterial fermentation of sucrose, glucose, and fructose, yielded information with respect to the relationship between the structure of the compounds and their attractiveness. The hydroxy, dibasic, and aromatic acids were generally more attractive than the aliphatic acids and simple alcohols. Among the simple alcohols and acids those containing propyl or propionyl groups were consistently attractive. The methyl series of their esters was most attractive when the alcohol radical was concerned while the propionyl series was most attractive when the acid radical was considered. Concerning the hydroxy and dibasic acid esters, those of the malonic, malic, lactic, and oxalic acids were attractive. The more complex alcohols and esters that contained a phenyl radical were attractive in laboratory and field trials. Evidently no single compound determines attractiveness of fermenting cane sirup to the codling moth. Bohorquez (*20*) attracted the

olive fruitfly, *Dacus oleae*, to traps with ammonium phosphate and ammonium fluoride. Females predominated in the catches. Buchanan (*86*), Bureau of Entomology and Plant Quarantine, observed that the injection of ethyl alcohol into living elm trees rendered them attractive to the ambrosia beetle, *Xylosandrus germanus*.



In a paper on traps for the Japanese beetle, Fleming *et al.* (*75*), Bureau of Entomology and Plant Quarantine, give new specifications for eugenol, a compound about as attractive to this insect as geraniol and a more standard product. Eugenol derived from clove oil is more attractive to the Japanese beetle than eugenol from cinnamon oil. It should meet these specifications—specific gravity at 25° C. 1.064–1.070; solubility 1 part in 2 parts of 70 per cent alcohol; boiling range 250–255° C. The oil should be a colorless to pale yellow, thin liquid with a strong odor of cloves and a pungent, spicy taste. Jones and Haller (*129*), Bureau of Entomology and Plant Quarantine, present a detailed study of the chemical composition of a sample of commercial geraniol which contained 34 per cent of geraniol, 17 per cent of citronellol, and smaller proportions of 12 other constituents.

Two papers have appeared this year on the use of protein lures for controlling fruit flies (*161*). Dean (*45*), New York Experiment Station, made preliminary trials with decomposing protein materials as attractants for adult apple maggot flies, *Rhagoletis pomonella*. Most attractive were powdered egg albumin, a peptone preparation, and dried yeast powder containing alkali. About 83 per cent of the captured flies were females, indicating a differential sex attraction for these materials. After several years' study, Boyce and Bartlett (*22*), found a preparation containing 2 per cent glycine (tech.) and 3 per cent commercial sodium hydroxide in water most effective for attracting the adult walnut husk fly, *Rhagoletis completa*.

A new method of baiting mosquito traps with carbon dioxide has recently been announced. The principle rests upon the discovery by Rudolfs (*207*) in 1922 that mosquitoes are attracted to carbon dioxide and ammonia. In 1934 Headlee (*111*), New Jersey Experiment Station, observed that if standard mosquito traps were equipped to volatilize carbon dioxide very large numbers of mosquitoes visited and were captured by the traps. Later studies (*112*) showed that the traps can be baited conveniently with solid carbon dioxide. These traps are now employed as indicators of the presence and abundance of mosquitoes, but there are possibilities of developing traps for the direct control of these insects.

Attractiveness of baits owing to taste, palatability, and perhaps other "agreeable" sensations may be considered under this heading. Mitchener (*171*), University of Manitoba, determined the attractiveness to grasshoppers of sawdust from several kinds of trees. The clear-winged grasshopper, *Camnula pellucida*, two-striped grasshopper, *Melanoplus bivittatus*, and the lesser migratory grasshopper, *Melanoplus mexicanus*, served as test insects. *Camnula* ate readily spruce or poplar sawdust if it was mixed with wheat bran, but Jack pine sawdust made a less attractive mixture. *Melanoplus bivittatus* consumed less readily baits containing poplar sawdust and bran, and all of these sawdusts made unsatisfactory bait mixtures for *Melanoplus mexicanus*. A knowledge of the source of the sawdust as well as the species of grasshopper for which the bait is prepared is shown by this investigation to be very important. Lea and Nolte (*142*) found sodium bicarbonate definitely repellent to several African species of grasshoppers. Attempts to improve the attractiveness of bran baits for Mormon crickets by the addition of amyl acetate, molasses, sodium chloride, and various other materials have been unsuccessful (*38*).

Ralston and Barrett (*198*), Armour & Co., investigated the repellent action of certain fatty acid derivatives on the housefly, *Musca domestica*. The decyl, undecyl, undecenyl, and dodecyl alcohols and the aliphatic nitriles with 10 to 14 carbon atoms were highly repellent. In fact, undecylonitrile, lauronitrile, tridecylonitrile, and dodecyl alchol proved more repellent than citronella oil. Large-scale tests with lauronitrile, which is nontoxic to human beings, are in progress. Searls and Daehnert (*203*) find 3 per cent of phenoxychloroethyl ether in a highly refined mineral seal oil an excellent repellent for flies that attack cattle. Hobson (*115*) found among 17 trial repellents for sheep maggot flies, *Lucilia sericata*, three that gave promise—olive oil, cottonseed oil, and oleic acid. None of these materials protected sheep longer than two weeks from the flies. In another paper Hobson (*118*) discusses attractants, repellents, antiseptics, ovicides, and larvicides in relation to the sheep maggot problem in England.

A mosquito trap baited with dry ice

NEW JERSEY EXPERIMENT STATION
PHOTO BY THOMAS D. MULHERN

According to Huckett (*120*), New York Experiment Station, the Mexican bean beetle, *Epilachna varivestis*, does little feeding on foliage that has been sprayed with derris. Larvae repelled from the derris-sprayed foliage die of desiccation on the surface of the soil. The residue from Bordeaux mixture also reduces the amount of feeding, and Huckett finds that derris powder incorporated in Bordeaux mixture protects the foliage of plants from the attack of this insect.

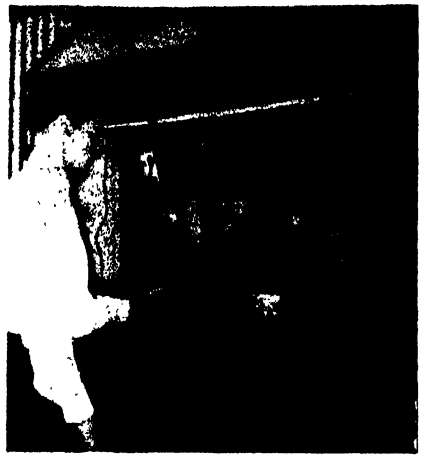
Johnson (*126*), Connecticut Experiment Station, protected grape foliage for a considerable period from attack by the Japanese beetle with a spray containing phenothiazine. Wallace (*247*), at the same station, reports borax entirely ineffective as a repellent for the bark beetles, *Hylurgopinus rufipes* and *Scolytus multistriatus* in elm logs. Miscible creosote oils reduced infestations, while a complete cover of liquid coal-tar creosote rendered the logs free from attack.

Dethier (*50*) finds that normal larvae of the imported cabbage worm, *Pieris rapae*, show definite signs of avoidance of benzaldehyde-air mixtures that contain 580×10^{-7} gram benzaldehyde. Larvae from which the antennae were removed, however, reacted to a higher threshold value of benzaldehyde (770×10^{-7} gram per liter). Shaw (*209*) discusses repellents for the honeybee and describes, briefly, experiments with creosote, tar oil, phenol compounds, naphthalene, and alpha and beta naphthols. These substances reduced

the number of visits made by the bees to sprayed blossoms. But some of these materials are too injurious to plants for use in horticultural sprays. The subject needs much further study.

Lesser (*147*), consulting chemist, Brooklyn, N. Y., offers 16 formulas for insect repellents which contain oil of citronella, pennyroyal, cedarwood coumarin, camphor, pyrethrum extract, and other active ingredients.

Methods for Testing Insecticides and Evaluating Toxicological Data



Methods for rearing certain leaf-eating insects in the laboratory and for testing stomach poisons applied as dusts are contained in two articles by Swingle *et al.* (*232*, *234*), Bureau of Entomology and Plant Quarantine. A simple technique is given for differentiating between the stomach poison, contact, and fumigant actions of compounds. Sweetman (*231*), Massachusetts State College, and Laudini and Sweetman (*141*) offer several methods for testing stomach poisons on cockroaches. An air-operated dust gun which applies small weighed quantities of insecticide dusts is offered by Harries (*108*), Bureau of Entomology and Plant Quarantine.

A detailed investigation of small-scale laboratory spraying apparatus has been made by Potter (*195*), Rothamsted Experimental Station, England, and a spraying tower is described in which uniform quantities of spray liquid can be delivered to groups of insects. O'Kane *et al.* (*184*), New Hampshire Experiment Station, have designed an "insect toximeter", which holds individual insects by means of wire clips and subjects them to a thorough coating of a spray liquid.

Standard methods for testing insecticides against certain household insects have been developed by Campbell *et al.* (*87*), Ohio State University. The apparatus and procedures are applicable to the evaluation of household sprays against the German cockroach, *Blatella germanica*, and the bedbug, *Cimex lectularius*, as test insects. Ford (*77*), The Upjohn Co., has studied the variation in Peet-Grady tests by the large group and small group methods (*19*). David and Havrey (*43*), Shell Marketing Co., London, have designed an apparatus for separating housefly pupae from the culture medium to obtain flies for Peet-Grady tests.

The bioassay of flysprays for treating livestock is the subject of a recent paper by Eagleson (*61*), Bureau of Entomology and Plant Quarantine. Hypnotic rather than lethal doses proved advantageous in evaluating the sprays on houseflies in an aerated spray tunnel. Mailen and Fenton (*162*), Oklahoma A. & M. College, test the repellence of livestock sprays by a new "half cow" method. Nelson (*177*), Stanco, Inc., reviews the methods for testing livestock sprays from the standpoint of their possible acceptance as official testing methods. According to the author, none of the existing methods is suitable for this purpose. Lennox (*148*) and Lennox and Webber (*146*) discuss at length methods for applying stomach poisons and contact poisons to blowfly larvae in the laboratory.

McGovran *et al.* (*158*) have devised an ingenious, manually operated micropipet

NEW HAMPSHIRE EXPERIMENT STATION

Insect toximeter

with which measured drops of contact insecticides can be applied to individual insects. Grayson and Swank (*100*), Iowa State College, offer a precise laboratory method for testing fumigants, the novel feature of which is the use of weighed doses of the fumigants in glass ampules broken in the container to release the fumigant.

Advances in the application of statistics to the evaluating of toxicity data from experiments with insecticides are noted. Bliss (*16*), Connecticut Experiment Station, treats mathematically the relation between exposure time, concentration, and toxicity with special reference to fumigants. In another paper (*17*) he discusses the place of biometry in biological assay, and in a third (*18*) methods are given for the statistical estimation of insect populations. Beall (*13*) contributes a paper on the fit and significance of contagious distributions as applied to populations of insect larvae. DeBeer (*46*) Burroughs, Wellcome and Co., describes a method for determining graphically the slopes of dosage-mortality curves.

Reviews

Several important reviews have been issued recently by the U. S. Bureau of Entomology and Plant Quarantine. One of them (*6*) concerns the work of the Division of Insecticide Investigations from 1927 until 1939. The accomplishments of this period are included in 518 papers published and in process, and in 98 patents granted and applied for. The research accomplishments are described briefly and a bibliography concludes the article. Vivian and Acree (*246*) list and discuss the organic sulfur compounds used as insecticides during 1935, 1936, and 1937. The list supplements another published by Roark and Busbey (*205*) in 1935. Each compound is discussed briefly with respect to insecticidal use, references and patents are cited, and there is a list of the insects and other organisms on which the compounds were tested.

Rawlins (*200*), Cornell University, summarizes the recent entomological research on insect pests of the potato. There are 32 references including a number on chemical control of potato insects.

Zoology in 1941

M. L. GABRIEL AND H. B. STEINBACH

Columbia University, New York, N. Y.

Hormones and Neurohumors

For some two decades evidence has been accumulating for the view that certain portions of the nervous system in invertebrates and vertebrates carry on an endocrine activity. Recent studies extend this earlier work and offer a structural basis for the physiological findings. Brown and Cunningham (*9*), Marine Biological Laboratory and Northwestern University, showed that sea-water extracts of portions of the nervous system of the horseshoe crab, *Limulus*, act to concentrate chromatophores when injected into blinded fiddler crabs, *Uca pugnax*. A probable source of this principle has been suggested by Scharrer (*48*), Western Reserve University and Marine Biological Laboratory. She described glandular, colloid-filled cells in horseshoe crab nerve tissue, the distribution of which correlates well with the distribution of the chromatophore-affecting substance found by Brown and Cunningham. Similar neuroglandular cells have been described by the Scharrers in the brain of the killifish *Fundulus* (*50*) and in the cockroach (*49*). In such cells activities suggestive of a secretory cycle can be demonstrated.

Kleinholz and Bourquin (*29*), Cold Spring Harbor and Harvard University, repeated the experiments of earlier workers on eye-stalk removal in the fiddler crab *Uca*, and concluded the evidence is insufficient for believing that molting is inhibited by a hormone produced there.

The culture medium in which ripe females of the polychaete worm *Ophryotrocha puerilis* have been kept causes such females to resorb their eggs after 8 to 10 days, according to Hartmann and Lewinski (*25*), Kaiser Wilhelm Institute. They have extracted from these animals a substance which has the effect of masculinizing females up to 100 per cent, as compared with the control sex ratio of 50 to 50 per cent. The authors think that the active material is liberated from the eggs, and has, they suggest, a female-inhibiting effect. Its action would thus be the opposite of that of vertebrate sex hormones.

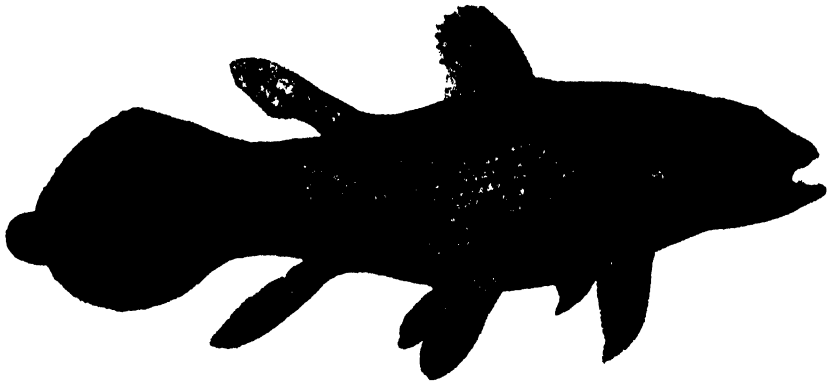
Studies on the recently discovered hormonal control (v^+ and cn^+ hormones) of eye color in insects have been extended. Tatum and Haagen-Smit (*60*) found that the v^+ active substance elaborated by bacteria cultured on a tryptophan medium is kynurenin combined with sucrose. The sucrose can be removed by hydrolysis, leaving the activity of the kynurenin unchanged. Beadle and Tatum (*4*), Stanford University, have proposed a scheme to explain *Drosophila* eye colors on the assumption that the vermilion gene controls transformation of tryptophan to kynurenin and that the cinnabar gene controls transformation of the latter into the cn^+ hormone which forms the brown eye pigment. It is supposed that these are competitive reactions, normal eye color depending on the availability of sufficient kynurenin, and vermilion eye color resulting from oxidation of the kynurenin needed for the second step. Kikkawa (*27*), Japan, also showed that the effects of certain genes on eye color in *Drosophila*, silkworm, and *Ephestia* concern the metabolism of kynurenin. Kikkawa, however, regards the kynurenin as a substrate rather than a hormone.

That sex hormones may act directly on susceptible tissues without some intervening systemic mechanism has been confirmed by Chamberlin, Gardner, and Allen (*13*), Yale University, who obtained unilateral sex changes in the sexual skin and mammary glands of monkeys by local application of estrone. A similar nonsystemic action of testosterone was observed by Kirschbaum and Pfeiffer (*28*), Yale University, on sexual pigmentation in the sparrow.

LOOK MAGAZINE, PHOTO BY JACK GODRICH

Dorippe, a crab inhabiting Asiatic waters. According to legend, these animals are the reincarnated spirits of Japanese warriors who have been drowned in battle.

Guyénot and Held (*22*), University of Geneva, have distinguished two principles in pregnancy urine. The first, which survives one hour's heating at 70°, is an auxogenic substance. The other, destroyed by this treatment, has a luteinizing effect. The auxogenic principle apparently acts only in the presence of the hypophysis.



Some of the variance in the results obtained by workers studying the effects of testosterone on sex organs may be explained under a scheme proposed by Shay, Gershon-Cohen, Paschkis, and Fels (*55*), Philadelphia. They have suggested that testosterone not only stimulates the testis, but inhibits the gonadotropic function of the pituitary. Experimental results would thus depend upon a balance between dosage and the variable activity of the pituitary.

Turner (*61*), Northwestern University, analyzed the factors controlling development of the sexually modified anal fin (gonopod) of the killifish *Gambusia affinis*. Production of the sexual modifications was found to depend on genetic determination of differentiation areas and specific structures, which could be expressed only at sufficient concentrations of male hormone and in a sequence governed principally by androgen concentration.

Confirmation of the role of the intermediate lobe of the pituitary in controlling color changes, previously proposed by Parker for the catfish, has come from the work of Rahn (*43*), University of Wyoming. Ablation of the intermediate lobe of the pituitary in the rattlesnake, *Crotalus v. viridis*, is followed by a permanent paling of the skin. Injection of chick intermedin causes a dispersal of the melanophores. Hypophysectomy is followed by reduction or cessation of melanin deposition in the scales, and it is possible that this activity is also controlled by the intermediate lobe.

The infundibulum may act as an inhibitor of the intermediate lobe of the pituitary, according to Etkin (*17*), College of the City of New York. This suggests that injury to the infundibulum may account for results previously interpreted as indicating activity of a "whitening hormone" (*W* substance).

Parker (*39*), Harvard University, has reported that ergotamine, which acts on melanophores, requires the intermediate

Latimeria, a living lobe-finned fish, belonging to a family thought to have become extinct in Cretaceous times.

action of the nerves, whereas the chromatophore controlling neurohumors—acetylcholine, intermedin, and adrenaline—act directly even on denervated cells.

Observing *Fundulus* chromatophores under polarized light, Shanes and Nigrelli (*54*), New York University and New York Aquarium, found a birefringent material which forms strands interconnecting the cells. The strands respond to adrenaline, ether, and potassium chloride like the melanophores themselves, which led the authors to believe that changes in pigment cells ascribed by Parker to lipohumors may be effected through this material.

Embryology

Pease (*40*), Stanford University and Hopkins Marine Station, exposed eggs of the sand-dollar *Dendraster excentricus* to concentration gradients of various chemical inhibitors. Enzyme poisons were found to affect bilateral determination, the regions of greatest inhibition becoming dorsal, those least inhibited becoming ventral. Pease has suggested that at least part of the key enzyme system is the cyanide-sensitive respiratory mechanism.

By treating unfertilized *Dendraster* eggs with thiocyanate and calcium-free sea water, Rulon (*47*), Hopkins Marine Station and Wayne University, obtained ectodermized forms, which he believes were caused by inhibition of the normal axiate pattern followed by recovery. The same treatment after fertilization gave rise to exogastrulae and entodermization.

Adult flour beetles, *Tribolium confusum*, produce a volatile substance which causes abnormalities in the developing offspring, according to Roth and Howland (*45*), New York University. These workers obtained this substance in crystalline form. Application of the crystals to developing beetle larvae results in duplication and triplication of legs, persistence of the larval condition of some parts, and other aberrations.

The development of the eye in an "eyeless" strain of mice was investigated by Chase and Chase (*14*), University of Illinois. The gene for anophthalmia allows an optic vesicle to form, but growth of the vesicle and cup formation are inhibited. When the optic cup is below a certain size, it can no longer induce a lens.

Tyler (*63*), California Institute of Technology, has extended and reviewed recent investigations on the action of fertilizin. Heating fertilizin produces a substance, assumed by Tyler to be a univalent fertilizin, which does not agglutinate sperm, but renders it incapable of subsequent agglutination and impairs its fertilizing powers. Egg water was found to contain a substance with these properties.

R. S. Lillie (*30*), University of Chicago and Marine Biological Laboratory, investigated the relation of water content of eggs to activation. Starfish eggs are sensitized to activation by such agents as butyric acid in a degree directly proportional to concentration and duration of exposure to media of different osmotic strengths. Lillie has suggested that activation depends upon the water content of the egg as reflected in the structural density of the cortical region.

Moore (*32*), Hopkins Marine Station, investigated the mechanics of gastrulation in the sand-dollar *Dendraster excentricus*. By means of osmotic pressure exerted inside the blastocoel, invagination can be prevented. The invagination force, thus measured, has a value of 2.6 to 5.5 mg. pressure, or in terms of work, 1×10^{-3} ergs.

Experimental Morphology

Attempts to elucidate the role of nerves in limb regeneration have not resulted in agreement. Schneider (*51*), Academie der Wissenschaften, Moscow, resected nerves supplying regenerating limb tissue in the axolotl, *Siredon pisciforme*. He concluded that the nerve has merely a trophic function in the regeneration process and that differentiation is an autonomous activity of the regenerant. Schotté and Butler (*52*), Amherst College and Princeton University, on the contrary, regard the nerve as playing a much more fundamental part in regeneration. From experiments on the regenerating forelimb of the urodeles *Amblystoma* and *Triturus* they concluded that the nerve maintains an equilibrium of cellular interactions without which regeneration does not occur, and they have suggested that cases of limb regeneration after nerve resection may be caused by incomplete severance or regeneration of the nerve.

Twitty and Bodenstein (*62*), Stanford University, studied fin formation in newts following substitution of flank ectoderm to prospective fin ectoderm. The capacity of the graft to form fins and that of the host neural crest to elicit fin formation was found to vary not only with age and position but with species. Transplantation experiments with hybrid animals showed that the capacities for induction and for response are modifiable by paternal factors.

Baltzer (*1*), Zoölogischer Institut, Berne, described the development of heteroplastic grafts of neural tube from the tree frog *Hyla* to the urodele *Triton*. The pigment cells thus transferred retain their cellular characteristics, but their arrangement is subjected to the pigment pattern of the *Triton* host. The grafted cells later become reduced, and in subsequent development are absorbed, leaving areas devoid of pigment.

Weber (*66*), University of Geneva, implanted optic vesicles of the chick to the region of the nerve cord. Such implantation, he found, causes an inhibition of the normal histodifferentiation (vacuolization) of the nerve cord so that it has the same structure as the brain in the region of the optic vesicle. Weber has suggested that some inhibitor of neural differentiation diffuses from the region of the lens

The "creeper" factor in chicks is a dominant lethal gene which, in the heterozygous condition, is expressed by shortening and distortion of the limbs. Homozygous "creepers" do not usually survive the fourth day of incubation and never reach the hatching stage. Hamburger (*24*), Washington University, transplanted "creeper" limbs to normal chicks. Heterozygous limbs developing in a normal chick retained their "creeper" characteristics and also their intrinsic growth rates. Homozygous wing and leg transplants were viable but showed the typical "creeper" morphogenesis. These findings indicated to Hamburger that the "creeper" character of limb primordia is determined early and that lethality does not reside in the organ rudiments, but that the "creeper" gene has a universal action, possibly through some general metabolic or respiratory deficiency.

Ectoderm of the gastrula of *Amblystoma punctatum* will form neural tubes in the absence of organizer, according to experiments reported by Barth (*2*), Columbia

University, in which pieces of ectoderm were explanted and allowed to develop. The frequency of occurrence of neural tubes is greater, Barth found, if the anteroposterior polarity of the explant is preserved. The capacity of the tissue for such autonomous neural differentiation shows a gradient passing from the animal pole to the region of the ventral epidermis.

Dalcq (*15*), University of Brussels, studied the development of the amphibian *Discoglossus* in which a rectangle in the central organizer region had been rotated through 180° before gastrulation. Regulative migration of the reversed area resulted in embryos of almost normal external appearance, but having derangements of the internal structure interpreted by Dalcq as indicating great stability of the predisposition of the disturbed region.

Valid comparison of the skull bones of different fishes depends upon clarification of the question as to whether lateral line organs are necessarily always associated with the same dermal bones. Moy-Thomas (*34*), Oxford University, in an attempt to answer this question experimentally, extirpated lateral line organs of the rainbow trout in early stages of development. He found that the underlying frontal bones develop largely independently of any influence of the lateral line canals.

By interspecific transplants of the vas deferens in larval *Drosophila*, Stern (*57*), University of Rochester, confirmed that the spiral shape of the testis is induced by an influence emanating from the tip of the vas deferens. Vasa deferentia of some species do, and of others do not exert the spiralizing action on the testis.

Rose and Rose (*44*), Columbia University, Marine Biological Laboratory, and Amherst College, in the course of studies on regeneration in the hydroid *Tubularia*, found that water in which *Tubularia* hydranths or cut pieces have been placed will inhibit regeneration if used as a medium for other *Tubularia* tissues.

Goldin and Barth (*20*), Columbia University, Marine Biological Laboratory, and Queens College, compared oxygen consumption with histological changes in regenerating *Tubularia* and reported a disappearance of the oxygen consumption gradient coinciding with a morphological dedifferentiation. Following this, a new polarity is established for tissue structure and oxygen consumption.

When the body of the oligochaete worm *Branchiura sowerbyi* is severed, gills secondarily form in the injured region from segments which normally lack gill structures. Nakamura (*35*), Tokyo Imperial University and Misaki Marine Biological Station, who studied this phenomenon, found that injury to the gut wall is a necessary condition for gill formation. Injection of macerated gut-wall cells into the body cavity of an intact worm results in gill outgrowth. He concluded that some substance produced by the injured cells possesses a gill-inducing capacity.

The rate of eye-spot formation in pieces of a regenerating planarian, *Planaria gonocephala*, follows a gradient depending on the level of the animal from which the regenerating tissue is taken, it has been reported by Watanabe (*65*), Sapporo, Japan. The rate decreases posteriorward, then increases in the posterior region of the body.

Haploid frogs can be obtained by removing the sperm head just after it penetrates the egg. Rotmann (*46*), University of Köln, compared the lenses of such frogs with those of normal frogs. His finding that haploid lenses are the same size as diploid lenses, having more but smaller cells, leads to the conclusion that induction does not influence a specific number of cells. Evidence bearing on this problem was adduced by Fankhauser (*18*), Princeton University, who has succeeded in raising triploid newts, *Triturus viridescens*. These newts have the normal body size, a smaller number of cells compensating for the larger cell size. This may be brought about by a lower division rate in polyploids, by a smaller cell total at the end of cleavage, or by some regulatory mechanism which controls the cell number.

Moore (*33*), Brooklyn College, measured the developmental rate of the nonviable eggs resulting from various crosses between species of frogs. The rate characteristic of the maternal species obtains until gastrulation, when development stops. In viable hybrids—for example, *Rana pipiens* x *R. palustris*—the rate is maternal until the neural plate stage, but then the rate becomes modified to approach that of the paternal species. Moore has suggested that the influence of the sperm begins to be exerted at about the time of gastrulation. At this period the rate changes, or, if the sperm is incompatible, death occurs.

Porter (*42*), Princeton University and Rockefeller Institute, crossed northern with southern varieties of *Rana pipiens*. Study of diploid embryos and haploid embryos containing only the sperm nucleus has been reported to show differences in structure which can be attributed to northern or southern cytoplasm. The structural differences are most apparent in hybrid haploids, and Porter's interpretation is that in normal diploid development they are compensated for or masked by the effect of the nucleus.

Behavior

The newt *Triturus viridescens* ends its land phase and returns to water in the autumn of the year in which it becomes mature. Chadwick (*12*), Vanderbilt University and Highlands Experiment Station, was able to induce the drive to migrate to water by injecting prolactin, and also by injection of pituitary from an amphibian, a reptile, and a bird. There was no effect on the gonads.

The mechanism by which bats are able to avoid obstacles was worked out by Griffin and Galambos (*21*), Harvard University. They have stated that bats avoid obstacles by emitting notes of supersonic frequency and interpreting the reflected sounds they hear. Other senses were said to play a minor part.

The diurnal rhythm of activity of the spider beetle *Ptinus tectus* can be reversed by modifying the periods of exposure to light and darkness, according to Bentley, Gunn, and Ewer (*5*), University of Birmingham. Temperature is also a factor in maintaining diurnal rhythm.

Waloff (*64*), University of London, has described the mechanism whereby wood lice collect in moist air. Activity is decreased at high humidity and an increase in the frequency of turning movements occurs. The strength of the behavior pattern was found to be inversely proportional to the animals' resistance to desiccation.

Interesting behavior is exhibited by larvae of the fly *Platyura fulloni*, as described by Fulton (*19*), North Carolina Agricultural Experiment Station. These larvae are luminous and spin a web by means of which they catch small insects and spiders, thus reversing the proverbial roles of spider and fly.

Protozoa

It has been known for some years that distinct "mating types" may be distinguished in *Paramecium*. When individuals from different groups are placed together under appropriate conditions, they agglutinate in pairs. This "mating reac-

JACK GODRICH

Giant chromosomes of the salivary gland of *Drosophila melanogaster*

tion" was the subject of a study by Tartar and Chen (*59*), University of California and University of Vermont, on individuals of *Paramecium bursaria* which had been enucleated. They have reported that the cytoplasm alone exhibits reactivity and diversity of mating type. The reactivity results only in the preliminary agglutination but not in true conjugation. The mating characteristics are lost after the fragments have been without the nucleus for a time. Boell and Woodruff (*6*), Yale University, found a significant difference of about 12 per cent in the oxygen consumption of two mating types of *Paramecium calkinsi*, regardless of their physiological state.

By repeating determinations with improved technique, Hall (*23*), Columbia University, has demonstrated that for the ciliate *Colpidium* respiration, formerly regarded as cyanide insensitive, is 88 per cent inhibited by 0.001 *M* cyanide.

Cytology

The arrangement of cytoplasmic inclusions in cells has been regarded as a clue to the molecular structure of protoplasm by Pollister (*41*), Columbia University. The orientation of mitochondria in various types of cells apparently reflects the paths of diffusion in those cells, and he has suggested that the position of the mitochondria is explained on the assumption that they occupy the spaces between lines of long-chain molecules.

Studies by Schrader (*53*), Columbia University, on spermatogenesis of the earwig *Anisolabis maritima* suggest that electrostatic forces of attraction and repulsion, as postulated by Lillie, are at work. The occurrence of quadripolar spindles is taken to indicate that the centrioles adopt the furthest possible position apart due to mutual repulsion. The positions taken by chromosomes and centrioles suggest that the nuclear membrane plays a part in the electrostatic changes presumed to accompany mitosis.

In 1940, Calvin, Kodani, and Goldschmidt (*11*), University of California, described a striking modification of the salivary gland chromosomes of *Drosophila melanogaster* produced by treating the glands with highly alkaline solutions. The "lampbrush" structure of these chromosomes was interpreted as a central double chromonema from which there radiate looped chromonemata which form the "bristles" of the brush.

Calvin and Kodani (*10*) have extended studies on the chemical structure of the lampbrush chromosomes and described the unit of structure as a partially extended and partially folded polypeptide chain.

Painter (*37*), University of Texas, has studied the lampbrush structure in *D. hydei*. According to his interpretation, the lampbrush structure is the result of changes in the chromosome when the chromonemata, the bands, and the matrix are dissolved by the alkaline treatment. He states that the "bristles" are radiating fibers, the appearance of which accompanies the destruction of the matrix.

Evolution

Continuing studies on the blind characin fishes obtained in Mexican caves, Breder and Gresser (*7*), New York Aquarium and New York University, reported a complete gradation in structure from normal to completely eyeless individuals and described differences of behavior between seeing and eyeless fishes. The former go to dark places only under the stimulus of fright. The blind fish avoid light by some unknown mechanism. The authors see in this difference a possible isolation mechanism that would lead to an ultimate segregation of the cave forms.

In recent years much interest has been occasioned by the discovery, in the Pleistocene deposits of South Africa, of anthropoid forms much more manlike than any recent apes. Broom (*8*), Transvaal Museum, reviewed descriptions of some of these australopithecines, which were of an almost human grade of structure and lived in Africa contemporaneously with man living in Europe and Asia. He published a phylogenetic tree in which

JACK GODRICH

***Above.* Skull of Pithecanthropus, the Java "apeman". *Below.* Chapelle-aux-Saints skull of a Neanderthal man found at Corrèze in France. Restorations by J. H. McGregor.**

it is suggested that man arose from some Pliocene australopithecine form.

Park, Gregg, and Lutherman (*58*), University of Chicago, studied the effects of competition in populations of three species of flour beetles, *Tribolium confusum*, *Gnathoceros cornutus*, and *Trogoderma versicolor*, grown in common cultures in various combinations of two species. Certain species, they found, regularly survive others. In certain combinations the outcome of competition depends upon the initial density of the surviving species.

Genetics

Studies on the production of various classes of inheritable changes (mutations) by short-wave radiations have been continued. Kaufman (*26*), Carnegie Institution, showed that chromosome breakages induced in *Drosophila* sperm by x-rays remain inactive until the spermatozoa enter the eggs at fertilization, so that chromosome exchanges and reattachments take place at that time.

Demerec and Fano (*16*) Cold Spring Harbor, showed that at least two classes of chromosome deficiencies produced by irradiation exist: long deficiencies are caused by two independent breaks in the chromosome followed by a deletion of the intervening section; short deficiencies are due to a single "hit", apparently followed by some degenerative process destroying a series of adjacent genes.

Sutton (*58*), Carnegie Institution, proved that some of the deficiencies induced by x-rays are really terminal, that is, involve disappearance of the chromosome ends. This question has been considered in detail by MacClintock (*31*), University of Missouri and Carnegie Institution, who showed that loss of terminal genes in a chromosome may sometimes be followed by a union of the resulting wound surfaces, while under certain conditions such a union does not take place.

More strictly physiological aspects of the mutation process also received some attention. Olenov (*36*), Leningrad, found that *Drosophila* larvae deprived of vitamin B_2 may fail to pupate for as long as 20 days. Supplied with that vitamin, they take about 10 days to complete their development, so that the whole cycle takes about 30 days, or three times as long as normal. Nevertheless, the frequency of mutation in such flies is not greater than in normal ones, although it was shown earlier by Timoféeff-Ressovsky that the mutation process is proportional to time.

Beadle and Tatum (*3*), Stanford University, induced x-ray mutations in *Neurospora sitophila* which differ from normal in their food requirements. Thus, one of the mutants fails to synthesize vitamin B_6, another requires the addition of thiazole, and the third needs *p*-aminobenzoic acid included in culture media.

According to Sonnenblick (*56*), Queens College, sex differentiation in *Drosophila* takes place very early, there being no sex-indifferent stage in development.

Wholesale Druggists' Association Indicted

ACCORDING to the Department of Justice, a Federal grand jury sitting at Newark, N. J., has returned an indictment charging the National Wholesale Druggists' Association, 23 of its members, and 29 officers and agents, with conspiracy to violate the Sherman Act by fixing wholesalers' margins of profit on drug products. The indictment was the first to be returned alleging use of fair trade contracts in a manner contemplated neither by the Miller-Tydings amendment to the Sherman Act nor the State Fair Trade laws.

The National Wholesale Druggists' Association constitutes the largest group of drug wholesalers in the nation, doing approximately 80 per cent of the wholesale drug business in the United States.

Proceedings of the
AMERICAN CHEMICAL SOCIETY

Official Reports for the Year 1941

Secretary and Business Manager

THE index to the NEWS EDITION, printed in the December 25, 1941, issue, will give ready references to the important undertakings and accomplishments of the past year. This report will be brief.

Two general meetings were held during the year—one in St. Louis, Mo., April 7 to 11, and one in Atlantic City, N. J., September 8 to 12. Four new local sections were established and chartered in 1941: the Binghamton Section with headquarters at Binghamton, N. Y.; the San Diego Section with headquarters at San Diego, Calif.; the Southeastern Pennsylvania Section with headquarters at York, Penna.; and the Wooster (Ohio) Section with headquarters at Wooster, Ohio. The total number of local sections is now 97.

Two honorary members were lost by death in 1941—namely, Paul Sabatier of Toulouse, France, who died on August 14, and Walther Nernst of Zibelle, Oberlausitz, Germany, who died on November 18.

References to committee reports, awards, medals, divisional, local section, and regional meetings (including symposia held by the Divisions of Colloid Chemistry, Industrial and Engineering Chemistry, Organic Chemistry, and Physical and Inorganic Chemistry) will be found in the index to the NEWS EDITION.

The AMERICAN CHEMICAL SOCIETY moved into its new home in April and May of 1941 and is functioning in national headquarters where members are always welcome.

The Committee on the Professional Training of Chemists has been vigorously active, spending days at a time on its duties, and its latest list of accredited institutions will be found on page 1135 of the NEWS EDITION for 1941.

Employer-employee relations have been very carefully considered by the Council and the Board of Directors (see NEWS EDITION for 1941, pages 733, 1014, 1082, 1442–44).

Very special consideration was given to the attempt by the Federation of Architects, Engineers, Chemists, and Technicians to force professional men into a heterogeneous union containing a considerable majority of nonprofessionals. The case was brought before the National Labor Relations Board, counsel for the AMERICAN CHEMICAL SOCIETY conferring and advising with counsel for the intervenors and representing them in the final oral argument before the N.L.R.B. in Washington. The outcome was all that the AMERICAN CHEMICAL SOCIETY had ever hoped to attain. Every one of the principles which the SOCIETY has advocated was definitely established in the findings of the N.L.R.B. (see "National Labor Board Decision Upholds Professional Status of Chemists", pages 165–69, CHEMICAL AND ENGINEERING NEWS, formerly the "NEWS EDITION", February 10, 1942). The election ordered was held on February 11 and the Professional Group voted against union affiliation.

A large portion of the Secretary's time has been spent in strenuous endeavors to retain chemists and chemical engineers in positions where they can render the best service to the country in this national emergency. Your Secretary has been in constant touch with officials of the Selective Service System. Although many errors of local boards have yet to be corrected, at least 90 per cent of the chemists and chemical engineers of America will continue to serve where their years of training and experience will not be lost (see NEWS EDITION for 1941, pages 129, 453, 457, 459, 480, 520, 681, 1464). The entire situation has been summed up in the article entitled "The 'Production Army' *vs.* the 'Combat Army'" (see CHEMICAL AND ENGINEERING NEWS, page 157, February 10, 1942). This was based on an extensive survey by the National Defense Committee of the AMERICAN CHEMICAL SOCIETY, and the results have been transmitted in special letters to the Army, the Navy, and the War Production Board.

By order of the Board of Directors of the SOCIETY, following action taken at the Atlantic City meeting, the Committee on Economic Status was appointed and immediately went into action (see pages 1133, 1195, 1245, NEWS EDITION, 1941). A preliminary tabulation of results, as of January 10, 1942, will be found on page 164 of CHEMICAL AND ENGINEERING NEWS, February 10, 1942. It shows that the SOCIETY'S American membership is composed of approximately 22 per cent chemical engineers, 70 per cent chemists, and 8 per cent in other fields but adequately trained in chemistry or chemical engineering. Thirty-nine per cent have received doctorate degrees; 24 per cent, master's; 32 per cent, bachelor's; and the balance have reached professional status through years of experience and accomplishment or are enrolled as junior members without degrees. Of the total reporting as to sex, 96 per cent were males. This means that the SOCIETY has approximately 1,000 women members. Several hundred replies have been received since January 10, 1942, and are being tabulated, but it is improbable that the general percentages will vary to any great extent. The committee will report in detail at the general meeting of the SOCIETY in Memphis. The report promises to be extremely interesting since it will develop many additional economic data covering emoluments and other pertinent material in the various groups.

The Committee on Patent and Related Legislation, under the guidance of Chairman Walter A. Schmidt, has been extremely active in helping to guide legislation and protect the interests of chemists and chemical engineers.

Subscriptions to all of the SOCIETY'S publications and the SOCIETY'S membership again show a marked increase, greater in 1941 than in any previous year of the SOCIETY'S history. The total paid subscriptions and the total membership figures for the past three years follow:

The Employment Clearing House, conducted at each general meeting of the SOCIETY, based on personal interviews which are arranged by the SOCIETY between employer and employee, continues to become more important with each meeting (see index to NEWS EDITION for references to detailed information and accomplishments).

The Treasurer's Report which follows clearly points out another successful financial year, with increased income and expenditures, all of which are used for the benefit of the membership.

The collections made through the Business Manager's office for the year 1941 follow:

Dues	$256,177.00
Subscriptions	219,675 80
Back numbers	9,652.13
Postage	19,147.32
Bank interest	1,986 00
Royalties	2,731.17
Reimbursement of general meeting expenses	4,940.48
Decennial Index sales	3,307.30
Building rents	11,916 67
Miscellaneous	3,772 50
TOTAL	$533,306.37

The above amount was duly deposited by the AMERICAN CHEMICAL SOCIETY with the Munsey Trust Co. The collections made through the Business Manager's office in 1940 amounted to $481,740.07. Therefore, in 1941 there was an increase in collections of $51,566.30.

The reprinting of Volumes 1 and 2 of *Chemical Abstracts*, and the sale of these two volumes by G. E. Stechert and Co. announced on page 200 of the NEWS EDITION for 1941, will be long delayed since the journals were reprinted in China and were lost in transit. The SOCIETY has a few, but only a few, complete sets for sale. No full sets of the *Journal of the American Chemical Society* have been available for years, although volumes since 1906 can usually be furnished. Most of the volumes of *Chemical Abstracts* after Volume 10 are still obtainable as volumes. Some 40 complete sets of *Industrial and Engineering Chemistry* are available and are offered for sale in complete sets. In a few years these, too, will be exhausted. The SOCIETY'S stock of journals is being kept in the best possible condition by the occasional purchase of single numbers in order to complete volumes, but otherwise the SOCIETY purchases no journals. Back numbers are mailed directly from Easton, Penna., and orders are sent through the office of the Secretary. In 1941, 122,671 copies of journals were mailed from Easton aside from the regular mailing lists.

In 1941 the number of student affiliates increased from 1,123 in 42 chapters to 1,820 in 64 chapters. Every effort is made for the sake of the students, as well as the SOCIETY, to interest them at an early age in the work of the SOCIETY.

The SOCIETY'S future appears bright.

CHARLES L. PARSONS
Secretary and Business Manager

Treasurer

THE annual audit of the books of the AMERICAN CHEMICAL SOCIETY has been made and the audit is herewith respectfully submitted and recommended to your attention.

ROBERT T. BALDWIN, *Treasurer*

Detailed report follows

F. W. LAFRENTZ & CO.

CERTIFIED PUBLIC ACCOUNTANTS

Executive Offices New York City

100 BROADWAY, NEW YORK

January 30, 1942

BOARD OF DIRECTORS
AMERICAN CHEMICAL SOCIETY:

We have examined the statement of assets and liabilities with related statements of cash and securities of the AMERICAN CHEMICAL SOCIETY as of December 31, 1941, have reviewed the system of internal control and the accounting procedures of the SOCIETY and have examined or tested its accounting records and other supporting evidence, by methods and to the extent we deemed appropriate.

In 1940 the SOCIETY acquired land and buildings in Washington, D. C., at a total cost of $150,000. In 1941 the Board of Directors by resolution ordered that a reserve of $50,000 be set up to be applied against the investment in land and buildings in Washington, D. C., and instructed the appropriate officials not to capitalize any building alterations or improvements and to provide for necessary depreciation. Accordingly, a special reserve of $50,000 has been provided, expenditures for alterations and improvements amounting to $16,082.41 have not been capitalized, and provision has been made for a reserve for depreciation of $1,000.

In our opinion, the accompanying statement of assets and liabilities with related statements of cash and securities presents fairly the position of the AMERICAN CHEMICAL SOCIETY at December 31, 1941, in conformity with generally accepted accounting principles which have been applied on a basis consistent with that of the preceding year, except as explained in the preceding paragraph.

F. W. LAFRENTZ & CO.
Certified Public Accountants

Journal of the American Chemical Society

The number of Articles, Communications to the Editor, Book Reviews, and New Compounds published in the journal during the past year and (with the exception of New Compounds) the preceding four years and the pages occupied by them are given in the following table:

Articles, etc.	Number				
	1937	*1938*	*1939*	*1940*	*1941*
Physical and Inorganic	382	327	390	369	414
Organic and Biological	436	557	655	659	619
Communications to the Editor	40	53	66	40	52
Books Reviewed	89	119	99	111	73
New Compounds	..	..	..	16	36
	Pages				
	1937	*1938*	*1939*	*1940*	*1941*
Proceedings and Obituaries	40	22	27	5	2
Physical and Inorganic	1498	1422	1576	1561	1671
Organic and Biological	1188	1578	1921	1883	1788
Communications to the Editor	28	36	49	24	30
Book Reviews and Books Received	40	60	40	47	44
Indexes, Additions, and Corrections	46	50	55	48	54
Standing, Title Pages, At. Wt. Table	32	32	32	32	32
New Compounds	..	..	..	6	13
Total Pages	2872	3200	3700	3606	3634

It can be seen from this table that the marked increase in the total number of articles and the preponderance of the organic and biological as compared with the physical and inorganic articles, which began in 1938, were maintained in 1941. The average length of the articles last year—namely, 3.3 pages—was substantially the same as has prevailed in recent years.

The term of Frederick G. Keyes, who was elected to fill the unexpired term of Joel H. Hildebrand as Associate Editor, expired with the current year. I am happy to say that at the Atlantic City meeting of the Council he was reëlected for a second term.

The second terms of G. E. F. Lundell and Hugh S. Taylor as Associate Editors also expired with the current year. At the Atlantic City meeting N. Howell Furman and Paul H. Emmett were elected to succeed them.

I wish to express to Dr. Lundell and Dr. Taylor my appreciation of, and gratitude for, their long, wise, and understanding services in behalf of the *Journal of the American Chemical Society*.

Arthur B. Lamb, *Editor*

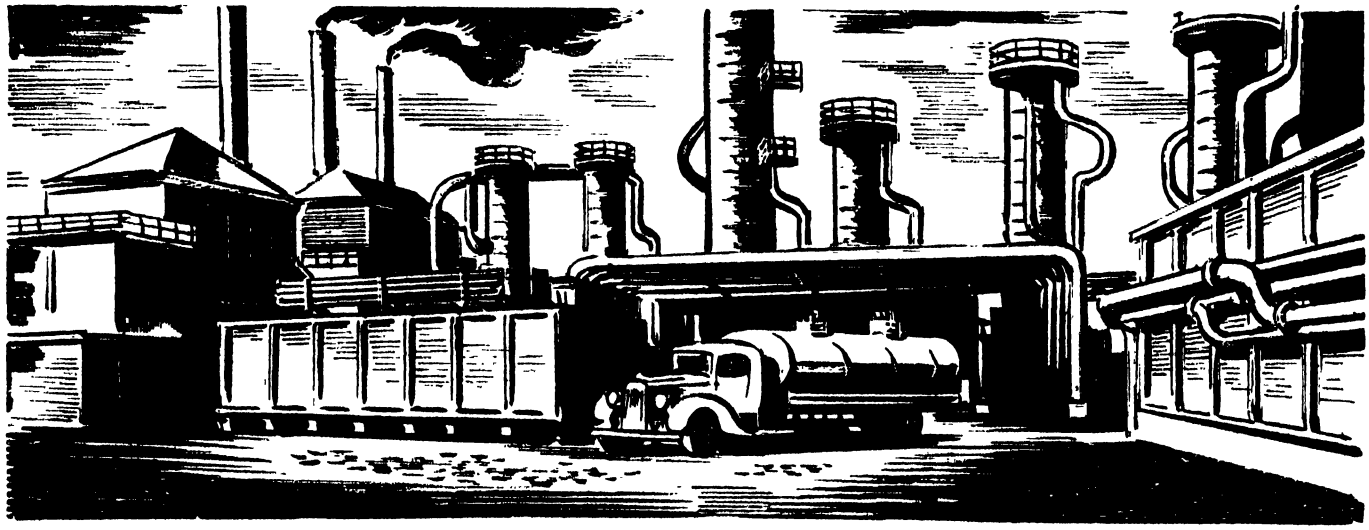
Chemical Abstracts

In spite of war *Chemical Abstracts* published more abstracts in 1941 than in 1940. The small increase (505 abstracts) is to be attributed to success during 1941 in the abstracting of European chemical patents after overcoming difficulties which interfered with this abstracting for a considerable period after the outbreak of war in Europe. The 1941 volume contained 5,541 more abstracts of patents and 5,036 fewer abstracts of papers than in the 1940 volume. The abstracts for 1941 total 52,764 in number as contrasted with 52,259 abstracts published in 1940. Of the 1941 abstracts 35,588 are of papers and 17,176 are of patents.

Chemical Abstracts endeavors to cover the chemical literature of the world completely. World-wide warfare presents many serious handicaps in this effort. *Chemical Abstracts* did not approach completeness so closely in 1941 as in normal years. Nevertheless, the record for 1941 is good. Abstracts from many of the papers published during 1941 in the warring or conquered European countries were obtained by some success in getting the needed periodicals (good success until Russia's entry into the war closed the trans-Siberian route), by searching this country for periodicals received in one library or another, and by having abstracts made in Europe, particularly in Switzerland and Germany, and sent by clipper ship.

In general, the policy of *Chemical Abstracts* is to publish informational rather than merely descriptive abstracts. Special emphasis has been placed on this for European and other publications not readily accessible to most Americans at the present time. The average page of *Chemical Abstracts* in 1941 contains 11.5 abstracts of papers or 18.6 abstracts of patents. The corresponding figures for 1940 are 12.1 and 18.0, respectively.

The edition of *Chemical Abstracts* averaged approximately 15,000 copies during 1941.



The much-used List of Periodicals Abstracted by *Chemical Abstracts*, with its key to library files, is normally published in revised form every five years. The list was due for revision in 1941, but the war has made postponement necessary. Satisfactory revision with American libraries in their present war-handicapped condition is not possible. The *Chemical Abstracts* office is keeping as well informed as possible concerning scientific periodicals and is willing to help users of abstracts locate full papers whenever possible. Hundreds of inquiries are answered monthly.

The only editorial change during the year was the well-earned elevation of Charles L. Bernier to an associate editorship following the regretted resignation of Janet D. Scott, who left to join the Chemical Warfare Service staff at Edgewood, Md. Miss Scott is continuing to help in the naming and indexing of inorganic compounds. The Editor gratefully acknowledges the valuable help of all of the assistant editors and abstractors, many of whom are continuing their work for *Chemical Abstracts* in spite of heavy national defense assignments. Our work is regarded as being in the same category.

Statistics for the various sections follow:

	1941			
	Abstracts of Papers		Abstracts of Patents	
	No. of pages	No. of abstracts	No. of pages	No. of abstracts

Industrial and Engineering Chemistry

INDUSTRIAL AND ENGINEERING CHEMISTRY, including the *Analytical Edition*, in 1941 received 878 manuscripts for consideration. Approximately 60 per cent of these manuscripts have been or will be accepted, some of them still being in process of review and revision which occasionally involves additional experimental work, delaying publication for some months after the receipt of the manuscript. This constitutes the largest number of papers received in any one year since records have been kept. Including the index and contents pages, the volume for the year exceeded 1600 pages for the *Industrial Edition* and was 948 for the *Analytical Edition*. This is a large return for the cost to the members, and well illustrates what is accomplished through the teamwork of members of the AMERICAN CHEMICAL SOCIETY.

Among the features were 13 symposia, some of them emphasized by the use of special inks in printing, decorative typographical devices, or extra illustration. Care was exercised to cover as evenly as possible the whole field of applied chemistry and to maintain a proper balance in each month's issue.

The *Analytical Edition* was once more distinguished by including in the October issue a small monograph emphasizing the place and utility of instruments in the analytical field. The issue has been complimented and reported to be of great utility to those who devote their talents to analysis and testing. It is obvious that the *Analytical Edition* has become the world leader in its field.

In May our offices were moved to the AMERICAN CHEMICAL SOCIETY BUILDING in Washington, where facilities had been made ready and where our work is now conducted in better organized and roomier quarters than we have enjoyed heretofore. The environment makes possible better work with less fatigue and the staff is enabled to carry an even heavier load than heretofore without adding to its numbers.

Once more we are pleased to have an opportunity to thank authors, the considerably greater number of reviewers, and staff members for faithful and cooperative work, without which an enterprise such as this would be impossible. We have been gratified by the increase in our circulation as well as by the world-wide origin of our contributions, and the news and information generally sent us by local section reporters and others interested in the advancement of chemistry.

H. E. HOWE, *Editor*

A. C. S. News Service

THE News Service is operating at a higher level of productivity than at any time since its establishment more than two decades ago. War conditions engender almost limitless opportunity for popular narration of progress in chemical science and industry. The outbreak of hostilities found the News Service in complete readiness to meet its larger responsibilities. Schooled to an appreciation of the vast contributions of the chemist to the contemporary civilization, millions of Americans look to the SOCIETY as a source of authoritative and unbiased information relating to the vital role of chemistry in the conflict between democracy and totalitarianism.

The News Service, it should be reiterated, exercises a reporting function. The material with which it works is derived largely from the SOCIETY'S publications. The articles appearing in *Industrial and Engineering Chemistry* and in the NEWS EDITION provide abundant data from which news narratives for newspapers and periodicals of general circulation may be readily prepared. The News Service also maintains contact with local sections and, whenever possible, publicizes the papers read at section meetings. This phase of News Service activity was strikingly successful during the past year. Cycles of publicity on regional meetings and year-end symposia produced gratifying results.

The more spectacular achievements of chemistry are far from being the sole concern of the News Service, which continually publicizes policies and projects of the SOCIETY definitely helpful to the chemical profession. The publicity given to the statement of the Board of Directors relative to the broad problems of employment in the field of chemistry is an example of this type of service. The work of the Committee on Economic Status and of the Committee on the Professional Training of Chemists are other examples of SOCIETY action which has gained recognition in the press. A special effort has been made by the News Service to stress the unwisdom of drafting for military service scientifically trained men whose abilities can be employed to the greatest advantage in industry.

Publicizing science is more than ever a cooperative enterprise. The News Service works in close association with the growing body of science writers who have so greatly enriched modern journalism. Newspapers are supplied with copy directly; so also are press associations, syndicates, magazines, and other news channels. The volume of published chemical news is increasing, and there is every indication that it will continue to increase, as public interest in chemistry is at a high pitch.

Coverage of the semiannual meetings is the biggest single task of the News Service. In connection with each of these meetings the News Service carries out an advance program of publicity which begins many weeks prior to the event, and which aims to call attention to the chemical resources of the convention area, as well as to focus national attention on the convention itself. The proceedings of these meetings, in addition to receiving extensive notice in the news columns, are, to a greater extent than ever, providing topics for serious editorial discussion. It is noteworthy that during the week of September 7 the *New York Times* carried five separate editorials dealing with significant aspects of the Atlantic City meeting.

Encouraging is the ready and courteous response of chemists to requests for papers, abstracts, and other material. Even in these trying times, when chemists are hard pressed by their professional duties, they make every effort to supply the News Service with the data which are essential to representative exposition of chemical developments. Public recognition, through the press, of the value of chemistry is, in no inconsiderable measure, due to the voluntary cooperation of the chemists themselves.

H. E. HOWE, *Director*

News Edition

THE NEWS EDITION of the AMERICAN CHEMICAL SOCIETY completed its greatest year in 1941 with the publication of 1526 pages. The increase in the size of the volume and marked gains in circulation both serve to indicate its growing importance.

Contributed articles on new developments in industry, chemistry, and economics discussed the application of our present knowledge to the defense program. Much space was devoted to the SOCIETY'S efforts to place chemists where they can contribute most to the war effort and to keep them up to date with the latest action of the Selective Service System and other matters of vital importance. Shorter items dealt with priorities and other government actions, supplies of strategic materials, and defense production. The double page spread, "The Chemical News Parade", pictorializing new plants or series of steps in various processes, continued to hold its popularity. Despite war conditions we were able to continue our World-Wide Chemistry department by stressing news from nations of the Western Hemisphere. Interest in the reviews of industrial research in this and other countries was evidenced by the large number of queries for further information and requests to reprint.

The NEWS EDITION continued to hold with ease its place as the publication with by far the largest circulation of any devoted primarily to chemistry.

Reid Appointed Chief of WPB Chemicals Branch

OEM PHOTO

Ernest W. Reid

APPOINTMENT of Ernest W. Reid, Pittsburgh, Penna., as chief of the Chemicals Branch has been announced by William L. Batt, director of Materials, War Production Board.

Dr. Reid has been assistant chief of the branch since its organization. He replaces Edward R. Weidlein, also of Pittsburgh, who will be retained as senior consultant. Dr. Weidlein has been devoting part of his time to the branch, with his efforts centered recently on development of the synthetic rubber program. He will continue this responsibility for the Materials Division.

Both men, native Kansans who received final training at the University of Pittsburgh, came to Washington in June 1940 as members of the Advisory Commission to the Council of National Defense and have headed the chemicals end of the war effort ever since. Both are from Mellon Institute, of which Dr. Weidlein is director. Dr. Weidlein was chemicals expert for the War Industries Board in 1918 and is a former President of the AMERICAN CHEMICAL SOCIETY and of the American Institute of Chemical Engineers.

D. P. Morgan and W. G. Whitman have been made assistant chiefs and Campbell Osborn executive officer of the branch.

A. C. C. & C. E. Offers to Aid Those Seeking Qualified Employees

THE Association of Consulting Chemists and Chemical Engineers, Inc., 50 East 41st St., New York, N. Y., has distributed to a cross section of American industry and manufacturers a pamphlet calling attention to the offer of the association to supply without charge the names of consulting chemists and chemical engineers especially qualified for a particular problem. These consultants are located from coast to coast and will be found listed with specific reference to their capabilities in the current classified directory of the association. Attorneys, industrialists, insurance executives, manufacturers, and physicians to whom the pamphlet has gone have received it with appreciation.

Diploma Mill Closed

THE Federal Trade Commission advises that the McKinley-Roosevelt College of Arts and Sciences has been ordered to cease and desist from its acts and practices of offering for sale and distribution correspondence courses of study and instruction. The corporation is no longer permitted to use the words "college" or "university" or to advertise in catalogs or in other literature that the business conducted by it is a university or college or institution of higher learning.

The commission finds that this so-called university was not an educational institution of higher learning, did not have authority to confer degrees, did not have a faculty of learned persons acting as instructors, and had conferred a large number of degrees upon a number of persons, including some described by it as members of the faculty of the school conducted by it, notwithstanding the stipulation made in 1936 between the commission and the said McKinley-Roosevelt University, in which it was agreed that these practices were not to be continued.

This corporation was organized in the state of Illinois and the entire business of the school was conducted by a man and his wife from an apartment located in one of the residential districts of Chicago. There have been many such devices for obtaining money from gullible people, but most of these have disappeared and it is good to know that another has joined the list of those which have been investigated, exposed, and ordered to discontinue their evil practice.

Export Control Protects Medicinal Supplies

DRASTIC action has been taken by the Board of Economic Warfare, Office of Export Control, to prevent excessive drains upon stocks of medicinal or pharmaceutical preparations, chemicals, or drugs used solely for medicinal purposes, on hand in the United States. New licensing controls have been announced which will conserve existing supplies and at the same time further remove any possibility of their falling into Axis hands.

Jackson G. Merriam is now employed by the Texas Division of the Dow Chemical Co., at its plant at Freeport, Tex.

Mathieson Alkali Observes 50th Birthday

THE Mathieson Alkali Works, Inc., producer of industrial chemicals, is celebrating its 50th anniversary. Incorporated in 1892 in Virginia, this company was the first to manufacture bleaching powder in the United States and pioneered in the production and marketing of alkalies, synthetic ammonia, and chlorine products. With plants in Saltville, Va., Niagara Falls, N. Y., and Lake Charles, La., Mathieson is one of the major producers of alkalies, chlorine, synthetic ammonia, and numerous other products. At present, all three plants have been geared to maximum production to supply chemicals vitally necessary to our all-out war effort.

Half a century ago, all of the bleaching powder and most of the alkali consumed in this country were still imported from England, and the prejudice in favor of the imported products was strong. To ensure a product equally as good, construction and initial operation of the new company's plant were entrusted to a retired English alkali manufacturer, Neil Mathieson. He sent a son, Thomas T. Mathieson, to this country, and under the latter's supervision a plant was built at Saltville, Va., where there are huge and historic salt deposits.

About that same time, Mathieson obtained control, in this country, of the Castner electrolytic cell for the manufacture of extremely pure caustic soda and chlorine and, to obtain cheap power, a plant was constructed at Niagara Falls. Production began in this plant late in 1896.

Other notable Mathieson accomplishments include commercial production of synthetic ammonia in 1923; development of a true calcium hypochlorite as a new chlorine carrier in 1928; development of sodium chlorite as an improved bleaching agent for textiles, paper, flour, and other materials in 1939; fused alkalies in briquet form for a variety of uses; synthetic salt cake to replace foreign supplies for kraft paper manufacturers; exceptionally pure dry ice and carbonic gas from carbon dioxide, obtained as a by-product from the ammonia soda process at Saltville; especially designed containers for the shipment of liquid chlorine; and distribution of caustic soda in liquid form in tank cars and in specially designed sea-going tanker, plying between Lake Charles and Norfolk, Va., where Mathieson operates a liquid caustic storage terminal.

Mathieson operations are depicted in pictures on pages 272 and 273.

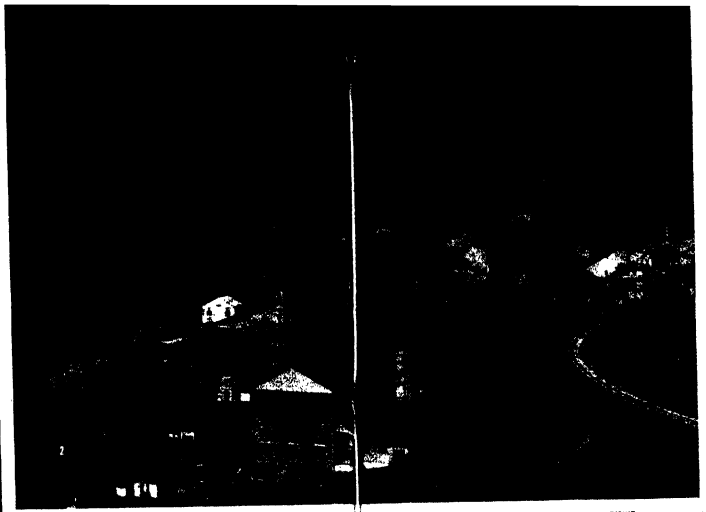
Defense Bulletin Number One
Effective 2-10-42

Priorities and Pyrometers

This Bulletin is intended to explain, to all users of temperature measuring and control instruments, how the National Defense Program affects these instruments, their purchase, use, maintenance, and the replacements necessary.

The information given points out the present scarcity of various materials and lists other materials which can be used as substitutes. The properties of the original materials and the substitute materials are compared.

Recommendations are also given on maintaining present equipment so that it will operate with maximum efficiency and give uninterrupted service.



This information is given in accordance with our policy of exerting every effort necessary to further the intelligent application and use of temperature instruments in the interests of our nation's defense.

Wheelco Instruments Co.

Buffalo Group to Meet

THE Buffalo Group of the Division of Rubber Chemistry, AMERICAN CHEMICAL SOCIETY, will hold its first 1942 meeting in the Hotel Westbrook in Buffalo, February 27, at 6:30 P. M. William B. Wiegand, director of research of Columbian Carbon Co., New York, assisted by William A. Ladd, electron microscope physicist, will present a paper on "Electron Microscope and the Significance of Its Findings Regarding Colloidal Carbon". Reservations should be made with J. S. Plumb or H. L. Wiley, U. S. Rubber Reclaiming Co., P. O. Box 365, Buffalo, N. Y.

The 1942 membership cards will be sent to members of the group upon remittance of the $1.00 annual dues to Mr. Wiley Secretary-Treasurer.

100 Per Cent A. C. S. Memberships

THE Chairman of the Membership Committee of the Chicago Section of the AMERICAN CHEMICAL SOCIETY informs us that the section now has three concerns with 100 per cent membership: Lindsay Light Co., Schaar & Co., and the J. T. Baker Co sales staff.

Sets of Abstracts

AS USUAL, sets of abstracts of meeting papers in planographed book form will be supplied by the A. C. S. News Service, 1155 16th St., N. W., Washington, D. C. Sets are not guaranteed to be complete, but contain abstracts from all divisions as submitted by authors. The abstracts will be mailed as soon as possible after receipt of order, beginning about April 15, and will also be on sale at Memphis, Tenn.

This enterprise is undertaken in a spirit of service and not for profit. Sets are offered on the following terms:

To members of divisions who forward receipt for divisional dues with remittance and order, 50 cents.

To those without receipt for divisional dues, who remit with order, $1.00.

To those who fail to enclose remittance with order, necessitating correspondence, $1.25.

To those who require bills to be rendered, $1.50.

Detroit Section Sponsors Review Courses

THE Detroit Section of the AMERICAN CHEMICAL SOCIETY is beginning an experiment to keep the information of the chemist current and available. Under direction of R. S. Shane, four intensive review courses are being given for practicing chemists on inorganic, organic, physical, and biological chemistry. Lectures begin March 2.

The courses run for 10 weeks and consist of 20 lecture hours. No tuition is charged, and no academic credit is given. Instruction is by competent men from the staffs of the University of Detroit and Wayne University. Courses are housed by the University of Michigan Extension Service in the new Horace H. Rackham Educational Memorial.

Professional Group Votes against Union Representing It

THE election ordered by the National Labor Relations Board to be held at the plant of the Shell Development Co. on February 11, resulted as had been predicted. The employees classed as professional by the board voted not to choose the Union to represent them, and those who were classed as nonprofessional employees voted in favor of the Union.

The L. S. O. G. Exchange

Edited by A. A. Ashdown, Ed. F. Degering, J. E. Hawkins, and S. L. Redman

Send items to Ed. F. Degering, Department of Chemistry, Purdue University, Lafayette, Ind.

WE, OF the Indiana Section, like to think of the AMERICAN CHEMICAL SOCIETY as a giant molecule bonded together by the local sections, with the individual chemists as electrons, free to carry on this SOCIETY'S great objectives. As all chemical systems depend for their potency upon the work contributed by free electrons, so do our local sections. When each member does his part, however small, the section, and by the same token the SOCIETY, becomes a virile organization.

Good organization makes for a good section. We see to it that our officers have had thorough training. With but few exceptions, our men have served an apprenticeship on the executive committee before being elected to a major office. They are then familiar with the policies and have had an opportunity to observe the methods used in handling the affairs of the Indiana Section. Those that will not give some of their time, and there are some in every section, are weeded out during this apprenticeship.

The Indiana Section also believes that a section with some project in progress which requires the active support of all its members keeps them on their toes. This section's Tuesday noon luncheon, held each Tuesday in the Hotel Severin, in Indianapolis, has long been a rendezvous for our members and visiting chemists. After lunch some member, or invited guest, talks for one-half hour on work he has done or is doing. This training is invaluable. May we add that these meetings close promptly at 1:30? Perhaps this is why Indiana Section members giving papers at national meetings stop on time.

The biennial student meetings of the Indiana Section (the 1941 spring meeting marked the 25th year since their inception) bring all the junior and senior students in Indiana colleges and universities majoring in chemistry and chemical engineering to Indianapolis for a two-day meeting. The program includes inspection trips to our chemical industries and talks by outstanding industrial chemists. In this we have had the wholehearted cooperation of the university authorities, the industries, and the national office of the AMERICAN CHEMICAL SOCIETY.

Few sections have adequate funds to obtain nationally prominent speakers at regular intervals without outside assistance. This section has solved this problem by cooperating with other sections. Starting as a small group, this organization has grown into the Mid-West Cooperating Sections of the AMERICAN CHEMICAL SOCIETY. By sharing expenses it has been possible for each of the cooperating sections each year to have speakers which each, individually, would not be able to entertain. It takes real cooperation to carry on a project of this magnitude and keep everyone satisfied. Differences do occur, but they are not insurmountable if there is a will to pull together.

New members will come easily to the wide-awake section. If your section is on its toes, has some project going that everyone talks about, the chemists in your vicinity will want to belong.

ASA N. STEVENS, Indiana Section

Milk Drying under War Conditions

CARLOS C. VAN LEER, Jr., 4712 Dover Road, Washington, D. C.

SIR JOHN ORR, author of "Food, Health and Income" and adviser to the British Ministry of Health, in November 1941 sent this statement to the writer, "We are determined that, at whatever cost, the health of the children in Britain shall not suffer from the food shortage. After wheat and fats I would put dried milk, either whole or separated, first on the list of imports. If you can fortify it with appropriate vitamins so much the better."

The United States promised to send Britain about 200,000,000 pounds of powdered separated milk from April 1941 to June 1942 and is finding difficulty in meeting this commitment partly because of the increased demand for cheese. Production of this concentrated milk in spite of all efforts continues to fall below that of a year earlier (*21*).

Spread of war to remote areas in the Pacific Ocean means that the Navy and Army also should have enormous quantities of this compact milk to help win what military men call the "battle of transportation". With transportation so hazardous and cargo space at such a premium, less compact forms of milk cannot compete with dried milks. Thus our deficient production of the latter constitutes a handicap.

To grasp the magnitude of this project, consider that it takes the cream from 10 quarts of milk to make a pound of butter—consider, too, that the country's annual butter production exceeds 2,000,000,000 pounds—and it's easy to see why separated milk from this source alone assumes torrential proportions (*5*). To this torrent must be added separated milk produced by ice cream and bottled cream operations, so that even after commercial utilization of around 5,000,000,000 quarts in 1939, the latest year for which figures are available, over 22,000,000,000 quarts remained which found no commercial market (*19*). This latter figure, amounting to over 61,000,000 quarts per day, is 6 per cent greater than that of the total United States consumption of fluid milk and cream in 1939—a quantity which would fill a row of quart milk bottles extending from New York to London every day of the year.

Most of this is fed to animals, despite Department of Agriculture estimates that milk is about 92 per cent wasted when fed to hogs and about 98 per cent wasted when fed to poultry (*20*). Although this milk, combined with cereal grains, does enable farm animals to utilize a much greater proportion of the incomplete proteins of these grains than would otherwise be possible (*1*), this is no especial comfort to mankind for whom it should be accomplishing the same function (*14*).

In February 1941 C. E. Gray, former president of the Golden State Co., Ltd., of California, expressed the opinion that perhaps one half the total amount of this milk, roughly 30,000,000 quarts a day, could feasibly be run through milk-drying machinery. To accomplish this, a somewhat higher price for milk powder would be needed, he explained, to bring in additional milk to new milk-drying equipment.

On December 16, 1941, an industry committee headed by Mr. Gray submitted to government authorities a report including the statement that at least 13,750,000 quarts per day might be brought into production rather quickly and efficiently, thus providing so great an amount of dried milk that even though 200,000,000 pounds were sent to Britain, relatively huge quantities would be available for our own military and civilian uses.

Almost unknown to the public, the amount of this almost fat-free milk run through milk-drying machinery has grown from just over 200,000,000 quarts in 1920 to an estimated 2,500,000,000 quarts for 1941. Since butterfat and most of the vitamin A content have been taken out and there is virtually no fat to turn rancid after drying, this milk powder has found rapidly increasing commercial use. Bakers take the largest quantities, with over 60 per cent of them using it, although it also goes into ice cream, sausage, cereals, prepared flours, etc. Quantities diverted to animal feeding are decreasing. Dried whole milk, more liable to rancidity, has not been used so widely and will not be discussed here

A quart of separated milk, reduced to powder, weighs about 3 ounces, fills three quarters of a cup, and keeps for months in a moistureproof bag. Roughly 1 pound of the milk powder is equivalent to 5 quarts of reconstituted milk. Such milk has sold at an average price of about 1.3 cents wholesale for the five-year period 1933-37 (*22*), but owing to war demand the price has recently increased to almost 3 cents per quart wholesale (*21*). Retailing costs need not add very much to the price of this milk, as the product is not bulky, is light to handle, and is not perishable. It has retailed to a very limited extent in Washington, D. C., Birmingham, Ala., and near San Francisco, Calif., at prices ranging from about 2.5 cents to almost 4 cents to make a quart.

A quart of fluid separated milk, weighing 34.4 ounces, and its equivalent in powdered milk weighing 3 ounces.

What may be termed a "4-cent quart" of separated milk is said by Mary Swartz Rose (*16*) to contain about 3 per cent more of the body-building elements of milk—calcium, phosphorus, and protein—than a quart of whole milk, there being no fat for which to account. This provides the basis for calculating from Mrs. Rose's food cost tables that the quantity of calcium, 1.19 grams, in 1 quart of powdered separated milk (equivalent to 1 quart of separated liquid milk) at 4 cents costs 100 per cent more when bought in evaporated milk at 8 cents per 14.5-ounce can. It costs 120 per cent more in American cheese at 30 cents per pound 257 per cent more in dried navy beans at 9 cents per pound, and 285 per cent more in whole milk at 15 cents a quart. These products are listed as the cheapest food sources of calcium in the United States (*15*).

This dried separated milk must be recognized as an incomparable food source of calcium, not closely rivaled in this respect by any other food in point of cost and capable of being used in prodigious quantities. This sentence is underlined by Henry C. Sherman who says that calcium is probably more often deficient in the dietary than any other chemical element. Sherman (*18*) further expresses the opinion that man can reach the age of 75 or 80 years with the same vigor he now enjoys at 65 simply by a sharp increase in the calcium content of his diet, with more of vitamins A and G (*17*). The *Journal of the American Medical Association* editorializes that among possible explanations of what appears to be a population-wide progressive demineralization with advancing years is first, and most likely, an inadequate amount of calcium in the diet of the average adult (*13*).

Mrs. Rose's tables reveal this milk powder also as the cheapest source of complete protein (*14*). The cost is very little above that of the cheapest incomplete grain or legume proteins.

In addition, this milk at 4 cents is one of the three cheapest United States sources of phosphorus, containing 0.94 gram, by the same tables.

These three pinnacles of body-building value—calcium, phosphorus, protein—are piled one on top of another in the same food. No other single food of comparable cost can match dried skim milk in the quantities of calcium, protein, and phosphorus found in a quart of this powdered milk. And how much less could any other food match the quality of these elements as they exist in milk, except in another form of milk bearing a higher price.

Vitamin G is present in such an amount that this milk powder constitutes one of the cheapest sources of the vitamin, which is relatively expensive at present. As to the general vitamin content, G. E. Holm, senior chemist of the Bureau of Dairy Industry, has supplied the writer with the statement that "practically all of the dried milks manufactured for human consumption are made by processes which do not expose the products to high enough temperatures for sufficient periods of time materially to affect the vitamin contents, except that of vitamin C in some cases. This vitamin is abundant in most vegetables and citrus fruits, which should be a part of every diet whether the milk used be a liquid or dried product."

Closely connected with the work on powdered milk are the contributions of Joseph Goldberger of the Public Health Service in discovering the cause of pellagra and in tracking down "starvation in a sense hardly dreamed of before" (*11*). Dr. Goldberger wrote in 1918, "Milk is the most important single food in balancing a diet and preventing or curing pellagra", but added sadly that it is "frequently hard to procure" (*12*). The chemist may recall the naming of vitamin G in Dr. Goldberger's honor.

As clearly as these considerations establish this milk as a food of singular importance, it cannot be denied that the possibilities involved in making liquid milk into casein wool are exceedingly interesting. The *American Journal of Public Health* (*8*) speaks editorially of casein wool as a good substitute for wool having some advantages over natural wool in that it does not shrink so much and can be worn next to the most delicate skins. There is enough of this surplus milk available to make 1,000,000,000 pounds of casein fiber, more than twice the consumption of wool in the United States at present, according to the journal.

In this connection, L. K. Riggs says that "no matter how we study industrial uses of milk and milk products, it remains true that the cow is a delicate, highly organized, and expensive converter. When this cow does take care of this delicate, highly organized, and expensive conversion of carbohydrates, proteins, and fats of feeds into other carbohydrates, proteins, and fats of milk, a peculiar food value has been added. The time is a long way off when industrial uses can or should claim such products", he asserts. For example, casein is undoubtedly adapted to certain definite chemical reactions which may bring about the production of plastics. Nevertheless, unless this peculiar and exceedingly valuable food product, the protein of milk, has some peculiar chemical characteristics which adapt it to such uses, it is almost certain to be replaced by cheaper and less perfect proteins from a nutritional point of view, he adds (*6*). As to this diversion, the Surgeon General has issued a statement that "these products should not be diverted to industrial use until we have utilized them to the fullest extent as foods".

Concerning the future, a vice president of the Borden Co. in 1936 declared that dry milk has a greater future than any other dairy product, and referred to an estimate that some day its use would increase fivefold as rather reasonable (*4*).

Another Borden executive has told the dry milk people, assembled: "There isn't anything you can use to take the place of those things which the cow puts into the skim milk solids. Is it economic from a national standpoint, from an agricultural standpoint, that we shall save that butterfat and throw away those skim milk solids? It isn't. It's a movement that is on and it is just as inevitable as that airplanes are developing and that automobiles have driven the buggy off the streets. It is just equally inevitable that skim milk solids are going to find their place in the human diet. Therefore there's no use of bucking" (*2*).

Why this most promising dairy product has not been more actively marketed is a matter too involved to deal with here. The industry calls it "a highly marketable commodity" (*7*) and states that its use gives the farmer two pay checks for milk instead of the one for milk fat only. Public health authorities will surely emphasize the point that this powdered milk must constitute a large addition to our national milk supply and must not merely substitute for milk now in use.

Dried milk, both whole and skim, has long been the subject of research and development. It was on the market at least 25 years ago, but the majority of households are unacquainted with it in any form, even though substantial sums have been spent in promotion and distribution (*9, 10*). Various reasons have been advanced for this slowness with which a material of such high food value and low cost has not gone beyond such commercial usage as is made by bakers, ice cream makers, and confectioners. Many believe the name "dry skimmed milk" is one of the principal deterents, but after hearings at which no acceptable alternatives were proposed, the Food and Drug Administration has defined skim milk as well as the products made from that raw material. Some years ago a chief of the Bureau of Dairy Industry said: "Centuries of skimming the cream from milk have not only fixed in our minds the idea that cream is the only thing worth recovering from milk, but unwittingly there has grown into our language the thought that 'skimming' removes the good from anything and leaves a residue of doubtful value" (*5*).

The many demands at present for casein temporarily complicate the problem and, if the American people should awaken to the value of dried separated or skimmed milk, production would have to be stepped up very materially. However, the emphasis on food values that has come with the British demand for the product may so change the situation that demands will justify the utilization of skim milk as the valuable foodstuff it is rather than divert it to less essential outlets.

At the present stage of development the finest samples of powdered separated milk are hard to distinguish from fresh milk, some report. In judging the product, one must be careful, of course, to obtain a representative sample. Since the milk has a remarkable ability to pick up moisture and cake, packaging is all-important. Recently the Rosefield Packing Co., Alameda, Calif., has developed a practicable glassine package, which may be kept in the home for almost a year. Further development of moisture-resisting, inexpensive packaging from materials not too greatly demanded by national defense would be a great contribution and should find large application.

Without the milk-dryer, 61,000,000 quarts a day of separated milk are of limited commercial value. It is hopeless to dream of transporting a thousand miles into great cities and into the South a product so swiftly attacked by bacteria that even costly refrigeration cannot save it for long—not even a pipe dream of it reaching 9,000,000 undernourished American school children. Then, sprayed in fine mist into the warm air whirl of the milk-drying chamber, trapped as fine white powder, this milk takes on seven-league boots. It can be shipped across the American continent, for as little as the cost of moving it 6 miles in fluid form, far beyond the reach of electric power lines or the delivery of ice. The milk powder can be used, small portions at a time, where there is a child but not a refrigerator. It will not freeze in Alaska, or Siberia, or in the atmospheres of high altitude flying. It is stalwart against bacterial attack 100 times as long as fluid milk, in some cases even 1,000 times.

Controlled quick drying, already diverting for man's use 6,000,000 quarts of skim milk a day—ready to make another 15,000,000, 20,000,000, or 25,000,000 available—is another great achievement in food technology. And today its advantages over liquid milk with regard to transportation and storage make powdered separated milk a foodstuff ideally adapted to military requirements. It offers a strategic asset which must not be overlooked.

Index of 4,000-Cards on Chemical Analysis by X-Ray Diffraction Issued

A 4,000-CARD file index of x-ray diffraction data for use in the method of chemical analysis by x-ray diffraction has been published by the American Society for Testing Materials. The compilation was sponsored by a joint committee of the A. S. T. M. and National Research Council under the chairmanship of Wheeler P. Davey, Pennsylvania State College. These data are for use in the method developed at the Dow Chemical Co. by J. D. Hanawalt and originally published in the *Analytical Edition* of *Industrial and Engineering Chemistry*[1].

The file index includes not only the original published data with later corrections, but additional data contributed by the Aluminum Co. of America and the New Jersey Zinc Co., and taken from the technical literature in the English language. The cards give all pertinent data found in the sources with provision for insertion of accessory data, such as crystal structure, density, etc. The index identifies the three strongest lines in the x-ray diffraction pattern of some 1,300 crystalline compounds, the chemical names and symbols of which are as given by the various sources.

An A. S. T. M. committee is perfecting a tentative recommended practice for the identification of crystalline materials by the x-ray diffraction method, with early publication anticipated.

The 4,000-card index packed in finished container boxes can be obtained from A. S. T. M. Headquarters, 260 South Broad St., Philadelphia, Penna., at $50 per set.

Vignette of a chemist

Insect Spray Production Is Important in South Africa

PRODUCTION of insect sprays from pyrethrum extract is an important activity in South Africa, with one of the largest manufacturers using 90 per cent of the pyrethrum extract output in the Union. This firm is using some American manufacturing processes, on a royalty basis, while other manufacturers are reported as importing their basic material, largely from the United States.

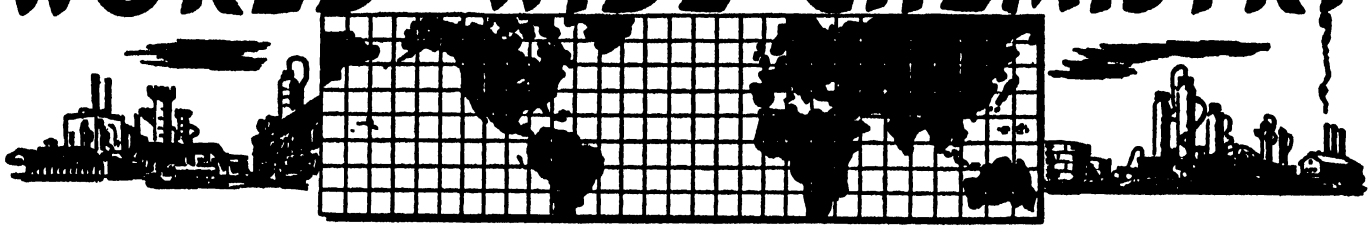
Imports of liquid insecticides in 1939 attained a value of £13,194, the latest available figure, of which the United States furnished 95 per cent. Of imports of nonagricultural insect powders and insecticides in the same year, totaling £38,132, the United States supplied 33 per cent, United Kingdom 45, and Kenya Colony, 12 per cent. Manufacturers' agents are the usual marketing medium.

Chemical Trade between Canada and U. S. Increases

GREATLY expanded chemical and allied exports to the United Kingdom mark the increase in Canada's foreign trade in these commodities, preliminary Canadian official figures indicate.

From a total exportation of chemicals valued at $52,541,100 during the first 11 months of 1941, $23,761,000 worth represented exports to the United Kingdom and $13,420,300 to the United States.

Nevertheless, it was reported, the United States continues to be the outstanding source of chemicals and allied products for Canada. Total Canadian imports for the first 11 months of 1941 were $60,006,100, of which more than $49,450,700 worth were imported from the United States, as compared to imports from Britain of $5,292,900.



Netherlands Indies Looks to U. S. for Formic, Acetic Acid

THE United States is, or was at the time of hostilities, replacing the Netherlands and Japan as the outstanding source of formic and acetic acids to the Netherlands Indies, it is reported through official channels. Freezing of Japanese accounts, prior to actual war, further stimulated trade with the United States for such important rubber coagulants.

Peru's Imports of Citric, Tartaric Acids Increase

INCREASED imports by Peru of citric and tartaric acids—88 metric tons for 1940 compared to 58 in 1939—are reported. The United States and Italy were chief suppliers in 1940, with the United States having the larger part of the market. France, Britain, and Argentina furnished small amounts.

WORLD-WIDE CHEMISTRY

A peacetime capital investment of $170,000,000 in the chemical industry of Canada in 1939 has been expanded by more than $112,000,000, with the construction since February 1940 of 23 new plants for the production of explosives and other war materials as well as their chemical ingredients. In addition to enlargement of existing ammonia plants, two new units have been erected to make nitric acid from nitrogen of the air. A large extension to a carbide plant has been built to obtain more acetylene for use as such or as a source of acetone. Construction of a plant for production of a certain explosive necessitated the building of new units to manufacture chemicals in which aniline oil, ethyl alcohol, carbon monoxide, and chlorine were needed. Phosphorus and chlorates are being made in greater quantities.

Exports of chemicals from Canada in 1941 increased by 19 per cent to about $59,000,000 and, although the Dominion is not self-sufficient in chemical products, the unfavorable trade balance declined to only $6,000,000 as against a comparable figure of over $20,000,000 in 1940.

A leader in the chemical industry re-recently said, "The industry's growth pattern has been radically altered since 1939. The process of developing the laboratory's findings to the stage where production can be undertaken has been replaced almost entirely by the enlargement of capacity based on the dictates of wartime demand."

Iron and Steel Production More Than Doubled Since 1938

The Dominion's 1938 monthly production of pig iron was 59,000 tons and of steel, 96,000 tons; in October 1941 Canada produced 137,000 tons of pig iron and 223,000 tons of steel. The industry is centered in three primary works at Sydney, Nova Scotia, and Hamilton and Sault Ste. Marie in Ontario. Sydney uses iron ore chiefly from Newfoundland and coal and limestone from Cape Breton. The coke ovens and blast furnaces at Hamilton and Sault Ste. Marie work with United States coal and iron ore. During 1941 about one half of the iron ore used at Sault Ste. Marie came from the new Helen siderite mines on Lake Superior in Ontario.

Restrictions on Imports Stimulate Glass Production

Production in the glass industry expanded considerably in 1941, permitting more efficient use of the excess furnace and machine capacity. Existing bottle designs have been frozen, and many of the industry's machine shops are producing parts needed for war purposes. Despite advances in labor and material costs, the industry was able to maintain selling prices at general prewar levels, largely because of economies resulting from the larger volume of business which permitted higher furnace loads.

New Trade Agreements Promote American Relations

A Canadian trade mission headed by The Honorable J. A. MacKinnon, Minister of Trade and Commerce, visited South America recently and reached agreements with Argentina, Brazil, and Chile whereby these countries are granted most-favored-nation treaty privileges with Canada. Understandings were reached with Ecuador, Peru, and Uruguay for better trade relations. Chemical materials will form an important item in the improved trade channels thus being opened.

Nickel Production Sets All-Time High

World nickel production and consumption in 1941 were at an all-time high. Output from Canadian mines and smelters increased about 50,000,000 pounds above previous annual figures. The United States consumed over two thirds of the world's total nickel output in 1941, compared with an annual consumption of about one third during recent years.

Electricity Plays Major Role in New Production

Never in Canada's history has there been such a demand for electricity. Canada is using more than five times as much electricity as in World War I. Present developments yield 8,800,000 hydraulic horsepower, and there are 34,000,000 horsepower in reserve in undeveloped resources. Electricity formerly used in electric steam boilers is being utilized for other industrial purposes. Central station output for uses other than steam boilers showed an increase of over 20 per cent in 1941. Canada's manufacturing and mining industries are over 80 per cent electrified. Increasing production of copper, nickel, and aluminum and the requirements of other groups such as the textile, pulp and paper, and chemical industries have created a great demand not only for electricity but also for electrical equipment. The electrical apparatus industry is making a notable contribution in manufacture of special war equipment for navy, army, and air force requirements.

With the knowledge that research has played such an important part in peacetime activities, development and research work in the seven nickel research laboratories operated by the largest producer, in Canada, the United Kingdom, and the United States, is being stressed. New nickel applications arising from current conditions, added to the background of research and development, will be available to help bridge the period of readjustment when peace is re-established. President Stanley of International Nickel Co. of Canada states that "the producers continue their intensive efforts to speed Empire production by supplying essential Canadian nickel at a maximum rate".

Rayon Production Makes New Record

Plant expansion in Canada's rayon industry has not been large scale, but improvements in equipment and maintenance are enabling the two major manufacturers to keep up a rate of production which employs about 5,000 persons and to play a vital part in maintaining textile supplies.

EDITOR'S NOTE. Those interested in further details should address the correspondent whose name and address appear for each country, and enclose sufficient international coupons to prepay the reply. United States stamps should not be sent.

Estimates of Canada's consumption in 1941, prepared recently by one of the principal companies, follow:

	Pounds
Domestic	
Viscose	14,200,000
Acetate on the basis of 130 denier	7,000,000
Imported	
Staple fiber	7,000,000
Acetate filament	2,300,000
Viscose and miscellaneous	1,600,000
Total	32,100,000

Petroleum Industry Steps Up Production

Canadian refineries have been reorganized and new installations have been and are being made to provide not only for the huge increase in volume of output but also for the manufacture of new products. Production of crude oil from the bituminous deposits of Athabaska was begun during the year. Blending agents necessary for aviation fuels have been imported heretofore, but a new plant projected for making such products from Turner Valley and refinery gases is expected to be in operation this summer. For production of motor gasolines the most important new Canadian development of suspensoid cracking will afford an improvement of approximately eight in the octane number over the usual thermal cracking process, according to a recent statement by one of the industry's leading executives.

Fuel oils, new lubricants, and asphalts are in much greater than normal demand, mostly for war needs.

Intense competition promoted research for improved products in recent years, and the better methods of processing thus developed are proving of great value.

Mineral Output Sets New Record

Canada's mineral production in 1941 reached an all-time high at $553,941,000, an increase of 4.6 per cent over the previous record of $529,825,035 in 1940.

Metals were valued at $393,269,000 in 1941 as against $382,503,012, an increase of 3 per cent. Gold production was slightly higher than in 1940, at 5,322,247 fine ounces worth $204,906,500 compared with 5,311,145 fine ounces at $204,479,083 last year. Silver output, at 20,437,196 fine ounces valued at $7,813,000, showed a decrease of 14 per cent.

The combined value of the base metals —nickel, copper, lead, and zinc—was $166,157,000, compared with $155,922,881 in 1940. Base metal production figures cannot be disclosed, but Canada holds an exceptionally strong position as a producer.

The value of the remaining metals produced in 1941 was $14,393,000, and included antimony, bismuth, cadmium, chromite, cobalt, manganese, magnesium, molybdenum, tungsten, arsenic, iron ore, mercury, radium, selenium, tellurium, titanium ore, uranium, and precious metals other than gold and silver.

Fuels, including coal, natural gas, and crude petroleum, were valued at $83,363,000 in 1941, compared with $78,837,874 in 1940.

Nonmetallic minerals, other than fuels, at a value of $31,616,000 gained 21.5 per cent, and structural materials advanced 8 per cent to $45,693,000.

Ottawa
January 20, 1942

Cellulosa d'Italia, the 130,000,000 lire company formed for production of cellulose from domestic raw materials, opened the first plant to use straw at Chieti last summer. Two other factories—one also for straw at Capua and the other for chestnut residues at Cuneo—were to go into operation during the winter months. Cellulose Regionale, another recently formed company, has commenced production in its plant at Ferrara.

Liquefaction of Methane Gas Investigated in Italy

Liquefaction of methane gas has been studied in laboratories of the Italian State Railways. It is reported that the problems involved are difficult to solve because of the complicated and costly plant required. Meanwhile investigations into problems of the methane gas engine have also been conducted by the National Motor Institute at Naples.

There are considerable natural deposits of methane gas in Italy. The more important ones are those in Parma province, Tuscany, Emilia, and Romagna which are developed by the Ente Nazionale Metano, a 20,000,000 lire company formed in 1940. The gas is carried in pipe lines to Florence and Bologna. Construction of a large circuit has been proposed connecting Ferrara, Padua, Milan, and Turin with a long pipe line which would also be able to draw on the extensive though rather scattered deposits in the Po Valley. Most of the gas used at present is still being carried in chrome-molybdenum steel cylinders with a capacity of 30 to 50 cubic meters. There are about 75,000 of these, but because of the time taken up by filling, storing, and transporting, only one in ten of these cylinders is in actual use at any given time. More containers cannot be manufactured at present because of the shortage of metals. The Italian methane gas production was estimated at 26,000,000 cubic meters for 1940. One cubic meter of methane gas is said to be equivalent to 1.5 liters of petrol.

A cargo vessel of 3,000 tons dead weight to be driven by producer gas derived from coke and coal is being built in a Copenhagen shipyard for delivery next summer. The ferry boat between the Danish islands of Alsen and Tünen has been converted to generator gas produced from peat. In Sweden the first generator-driven vessel has made its trial journey at Göteborg. Ferry boats serving the islands around Stockholm are to be converted from oil to generator gas and will resume full operation when this has been completed. The Finnish Government is reported to be considering compulsory conversion of agricultural tractors to gas generators. The Norwegian fishermen have been offered subsidies covering the total cost of conversion and fuel during the first three months of operation for the installation of generator equipment in their fishing boats.

Norsk Hydro Acquires Light Metal Interest

Norsk Hydro, the well-known Norwegian chemical producer, has maintained its dividend for 1940–41 at 6 per cent. Profits show slight increases which are absorbed by larger deductions for tax and depreciation. Security holdings have increased as a result of the acquisition of an interest in A. S. Lettmetal, a new company, while fixed assets including estate property, waterfalls, and plant declined, after deduction of reserves for depreciation and obsolescence.

Sweden Tries New Process for Shale Oil Production

The Swedish Shale Oil Co. is reported to have carried out experiments at Narke with a new process for the immediate production of oil from shale deposits, developed by Frederik Ljungström. Electrical heat elements are inserted in some drilling holes and heat the shale below the ground to 400° C. with the result that gas and vapor rise through other holes. These are condensed to oil. About 75 per cent of the oil contents of the shale, it is claimed, can be obtained by this method which does not require large investments apart from the equipment for the electricity supply.

Conditions in Mexico for production of iron and steel are unusual. Scattered all over Mexico are suitable iron ores, some remarkable for their content. But the coal mines which could supply metallurgical coke are found only in the northern region of the State of Coahuila, near the United States border.

Pig iron is produced in Monterrey only where the Fundidora Co. operates a blast furnace and produces 350 to 400 tons of pig iron daily. Part of this is used for steel. The company is constructing a second furnace which should be ready in about two years. Its capacity will be about 500 tons per day.

The Fundidora of Monterrey is not the sole producer of steel. The Consolidated Co. in Mexico City and the iron plant of Mazatlán are also important producers. Several small converters being installed will operate with smelting pots and will have an output of about 40 tons per day.

Production in 1940 reached 147,000 tons of laminated steel. Imports of this material in 1937 were 195,000 tons.

Several attempts have been made to reduce the iron ores with various kinds of coal. Some blast furnaces have been built to operate with charcoal, but have not been successful. An electrical furnace is also almost completed which will operate with charcoal as the reducer to produce pig iron.

A process has recently been patented by Professor González to treat the ore in a rotary furnace heated by oil. As the reducer, any coal and also peat may be used. A magnetic separator concentrates the mixture. An experimental furnace is already working in Mexico City with 5 to 6 tons' daily capacity.

New Plants Being Opened to Boost Acid Production

Production of sulfuric acid in Mexico is small, and the high price impedes development of various industries. The shortage may be caused by the lack of superphosphate output. Agriculturists are using fertilizers on a very small scale, and for this reason small plants only are producing superphosphates from bones. Sulfuric acid in large quantities is made by the American Smelting Co. in the northern part of Coahuila by using gases from the toasting of blendes. Another plant produces sulfuric acid free from arsenic by burning sulfur in a contact installation. At present the only sulfur available in Mexico is the very impure sulfur produced in the State of San Luis Potosí. A plant has just been completed to refine the sulfur from this important deposit, and the product obtained can compete with that of the United States.

Two plants are making hydrochloric acid. The sodium sulfate by-product is used in the preparation of sodium sulfide, and the country produces all the sulfide required for the tanning industry. Several lakes, partly dried, in the northern part of Mexico produce sodium sulfate. They are being exploited on a very small scale only and give a product not free from chlorides. The output is used in the glass industry. A plant which will give sulfate free from chlorate is being installed at one of these lakes, and the product will be used by a new plant for cellulose sulfate.

Nitric acid production is very low, and all of it is obtained from imported nitrate. The principal dynamite plant of Mexico produces its own nitric acid.

War Increases Problems of Meeting Alkali Requirements

Imports of sodium hydroxide in 1940 were 16,721 tons valued at $865,000. In the same year 16,766 tons of sodium carbonate worth $540,000 were imported. Under present conditions of the industry alkalies have more importance than acids, and only a small part of the required alkalies are produced in the country.

Studies have been made during the past few years to eliminate this difficulty. Electric power can be produced at a low rate. The country has a high plateau in its central part with plenty of rain, the plateau having level differences over 1,000 meters. Waterfalls are numerous and of good volume. Production of electrolytic soda has been contemplated but, owing to the industrial situation, use of the chlorine produced at the same time as the soda has been difficult. A more economical solution would be to build small plants to recover the alkalies of many of the alkaline lakes of this region.

An electrolytic soda plant, Productos Químicos Mexicanos, has commenced operations in Mexico City with a capacity of 3 tons per day. Besides the sodium hydroxide they produce several by-products from their lime and chlorine—potassium chlorate and calcium arsenate, the latter made with domestic arsenic. In products for agriculture they are manufacturing copper sulfate monohydrate. Several plants make this last product despite the high price of sulfuric acid and difficulty in the banana zone in competing with the product imported from U. S. under cheap return freight rates.

A new plant is producing carbon bisulfide, using sulfur from San Luis deposits as the raw material. This plant will meet requirements of the market for this product, of which 154 tons at $20,000 were imported in 1940.

The production of sodium carbonate from the lakes is in its preliminary stage, and a plant built at Lake Texcoco is producing about 3 tons of sodium hydroxide a day. Entry of the United States into the war has created a difficult problem in this country, due to the shortage of sodium carbonate.

A new plant for precipitated calcium carbonate will soon be opened in Mexico City, and will fill the country's requirements. In 1940, 447 tons were imported valued at $21,000.

Domestic Trees Used for Cellulose Output

The high altitude in the center of the country makes possible the growth of trees which normally thrive in northern latitudes only. Wood from the Mexican fir tree is used to obtain cellulose sulfate at a plant operating for the last few years near Mexico City. In a short time a new plant will be opened which will use reagents produced in the country.

Requirements of the country are far from being met. Last year 37,000 tons were imported with a value of $2,200,000. Several plants are being built to produce cellulose using other kinds of domestic woods as well as nonligneous material.

Naval Stores Industries Being Developed, Classified

Among naval stores industries, production of linaloe oil, which is typical of the country, should be mentioned. This oil is obtained in isolated regions and by primitive methods. Last year 34 tons worth $58,000 dollars were exported.

The turpentine industry has developed considerably and well distilled products are obtained. But, due to differences in altitudes, various kinds of pine trees produce turpentines of different compositions. Some of them have a high content of pinene, and others contain very little of this hydrocarbon. These grades are becoming known now and are being classified for export.

New Law Encourages Development of Industry

Among efforts made by the government to foster development of new industries is the law of April 21, 1941. A tax exemption is granted for five years to those industries whose activities are new or necessary to the industrial development of the country.

A WAR MESSAGE
to
ALL EMPLOYERS

★ From the United States Treasury Department ★

WINNING THIS WAR is going to take the mightiest effort America has ever made—in men, in materials, and in money! Every dollar, every dime that is not urgently needed for the civilian necessities of food, clothing, and shelter, must, if we are to secure final Victory, be put into the war effort.

An important part of the billions required to produce the planes, tanks, ships, and guns our Army and Navy need must come from the sale of Defense Bonds. Only by regular, week by week, pay-day by pay-day investment of the American people can this be done.

This is the American way to win. This is the way to preserve our democratic way of life.

Facing these facts, your Government needs, urgently, your cooperation with your employees in *immediately* enrolling them in a

PAY-ROLL SAVINGS PLAN

The Pay-Roll Savings Plan is simple and efficient. It provides, simply, for regular purchases by your employees of United States Defense Bonds through systematic—yet voluntary—pay-roll allotments. All you do is hold the total funds collected from these pay-roll allotments in a separate account and deliver a Defense Bond to the employee each time his allotments accumulate to an amount sufficient to purchase a Bond.

The Pay-Roll Savings Plan has the approval of the American Federation of Labor, the Congress for Industrial Organization, and the Railroad Brotherhoods. It is now in effect in several thousand companies varying in number of employees from 3 to over 10,000.

In sending the coupon below, you are under no obligation, other than your own interest in the future of your country, to install the Plan after you have given it your consideration. You will receive—1, a booklet describing how the Plan works; 2, samples of free literature furnished to companies installing the Plan; 3, a sample employee Pay-Roll Savings authorization card; and 4, the name of your State Defense Bond administrator who can supply experienced aid in setting up the Plan.

To get full facts, send the coupon below —today! Or write, Treasury Department, Section B, 709 Twelfth St., NW., Washington, D. C.

HOW THE PAY-ROLL SAVINGS PLAN HELPS YOUR COUNTRY

1. It provides immediate cash now to produce the finest, deadliest fighting equipment an Army and Navy ever needed to win.
2. It gives every American wage earner the opportunity for financial participation in National Defense.
3. By storing up wages, it will reduce the current demand for consumer goods while they are scarce, thus retarding inflation.
4. It reduces the percentage of Defense financing that must be placed with banks, thus putting our emergency financing on a sounder basis.
5. It builds a reserve buying power for the post-war purchase of civilian goods to keep our factories running after the war
6. It helps your employees provide for their future.

MAIL THIS COUPON NOW

Treasury Department, Section B
709-12th St., NW.
Washington, D. C.

We want to do our part. Please rush full information regarding the Pay-Roll Savings Plan.

POTOMAC POSTSCRIPTS

Allocations

Agar. The War Production Board has frozen all agar supplies in this country in the hands of persons having more than 50 pounds. Prior to June 1941 the major part of this country's agar supply came from Japan. Small quantities have also been received from China and Java. California manufactures a small amount.

General Preference Order M-96 prohibits the purchase or sale of agar from or by persons having more than 50 pounds in their possession, except as specifically ordered by the Director of Industry Operations or for use in bacteriological media. Any person seeking to purchase agar under the exemption for use in bacteriological media must certify to the seller that the agar is to be so used, and the seller must furnish a copy to WPB.

Cobalt Blue. Cobalt blue has enlisted for the duration with the issuance of Conservation Order M-39-b. An amendment has also been issued to General Preference Order M-39 placing cobalt in all forms under an allocation system. Previously only metallic cobalt and chemicals to be processed into metal were allocated.

Order M-39-b prohibits the use of cobalt in all pigments after May 1, and restricts its use until that time to 40 per cent of the amount used in the first six months of 1941. Most seriously affected will be the glass industry, particularly in the production of blue bottles. Ceramics will suffer, but to a lesser extent. Blue enamelware, inks, fabric dyes, paints, and stains are expected to turn to ultramarine blues composed of chemical synthetics. Blue optical glass and blue glass for other safety uses are not included in the prohibition.

Items made of cobalt not covered by the prohibition are restricted until March 31 to 23 per cent of the amount used in the first six months of 1941, and after that date to 35 per cent in any calendar quarter.

Exceptions include military orders and orders from certain other government agencies, on ratings of A-1-j or higher, and for these uses: chemical catalysts, cattle and plant food, chemical reagents, cobalt alloys of all kinds, decolorizer for glass, dryers, ground coat frit, hard facing compounds, laboratory and research equipment, pharmaceuticals, plating, and health supplies. The exception for ground coat frit will permit the production of enameled steel. Cobalt acts as a filler coat for steel, similar to shellac on wood, and is the only satisfactory binder for enamel on steel. Hard facing cobalt compounds are used in oil drilling for drill stems in place of industrial diamonds and otherwise in industry where extreme hardness is necessary.

Cobalt is one of the important steel alloys. Africa is a principal source of the metal, with a small amount coming from Canada. Domestic production is negligible.

Diphenylamine. Diphenylamine, chemical synthesizer and reagent, has gone under complete allocation control, according to terms of General Preference Order M-75. The order provides for monthly allocations and regular reports upon which allocations will be based.

Diphenylamine is used in the production of powder and other explosives, rubber, soap, sheep dip, insecticides, and dyes. Increased military demands have outrun existing supplies. New production is being considered to relieve the shortage.

Vitamin A. WPB acted February 10 to conserve vitamin A for human consumption. The main source has been fish liver oils. Supplies from Norway and Japan before the war accounted for approximately 75 per cent of the total consumed in the United States. Vitamin A is found also in several vegetables and in dairy products. It is said to be essential for maintaining good eyesight and as such is especially essential for the Air Corps. Vitamin A also aids in building up resistance against infection.

The order, L-40, prohibits the manufacture of multivitamin tablets, capsules, pills, or liquids containing more than 5,000 units of vitamin A in the largest daily dose recommended by the label or accompanying instructions. WPB Health Supplies Branch pointed out that competent medical authority states the average human body cannot absorb more than 5,000 units of vitamin A per day, so that units in excess of 5,000 are wasted.

The restrictions do not apply to preparations containing only vitamin A, or preparations containing vitamins A and D where the vitamin A potency is 25,000 units or more in the recommended daily dosage. Such a preparation is intended as a therapeutic dose for persons suffering from an unusual insufficiency of vitaminA, in which cases the body can absorb more than 5,000 units per day.

To conserve for human consumption fish liver oil having a high potency, the use or dilution for use is prohibited in the manufacture of feed of fish liver oil with a potency of more than 12,000 units of vitamin A per gram, effective February 10. Beginning April 10, feeds which in the form recommended for consumption contain more than 1,000 units of vitamin A per pound, derived from fish or fish liver oils, cannot be manufactured or prepared. The Health Supplies Branch stated that many feeds contain an excess of vitamin A. This occurs where fish oils are used for their vitamin D content which is found in combination with vitamin A in fish liver oils. Feed manufacturers may fortify their product by adding synthetic vitamin D to make up the difference caused by this restriction. It is believed also this order should stimulate the production of vitamin A from sources such as carrots and alfalfa.

Wool. As part of the wool conservation program, rayon producers will make available in March small sample lots of rayon tops to worsted manufacturers and thus stimulate experiments in the blending of rayon staple with wool in worsted materials. Sample lots will consist of rayon top 5½ denier, cut 4 and 5 inches, dull and bright, obtainable in lots not exceeding 200 pounds. The rayon being made available to the worsted manufacturers will replace in part new wool which has been curtailed by the Wool Conservation Order M-73.

Price Regulations

Fats and Oils. Revisions in Fats and Oils Price Schedule 53 are contained in Amendment 2, issued by Leon Henderson, Administrator, OPA.

Since the original order covered old lard made prior to October 1, 1941, OPA is allowing the addition of 1.895 cents per pound to the October 1 price for new cash lard as a ceiling maximum. This brings the permissible ceiling figure for cash lard in tierces up to 12.695 cents per pound. The amendment also permits addition of 0.675 cent to loose lard ceiling prices, making that maximum now 11.425 cents. On leaf lard, an addition of 0.49 cent is permitted, with the new ceiling 11.615 cents. An addition of 0.79 cent to the October 1, 1941, level is allowed for steam rendered pork fat, bringing the new ceiling to 11.325 cents.

No change is made in the lard or cottonseed oil futures ceiling prices as set in Amendment 1 to the fats and oil schedule. These prices were the closing bids of October 1, 1941. However, a provision in the new amendment states that the maximum price ceiling for lard futures contract months after September 1942 shall not exceed the September 1942 futures top set by OPA.

Salicylic Acid. Quotations by some resellers of salicylic acid at prices three times those of producers for comparable grades and quantities caused the issuance of Price Schedule 103, according to OPA. The schedule, which became effective February 16, sets prices for producers and primary jobbers and for wholesalers at levels prevailing at this time. It does not apply to the quantities ordinarily sold by retailers.

Conferences of OPA with producers, resellers, and exporters of salicylic acid and with representatives of other government agencies indicated that no justifiable reasons exist for producers and primary jobbers charging prices in excess of 35 cents per pound, or for resellers and exporters charging prices in excess of 46 and 49 cents per pound for U. S. P. salicylic acid in 100-pound and 150-pound barrels.

Salicyclic acid is used chiefly in the manufacture of aspirin and other internal and external medicinals, in making chrome and khaki dyes, and in vulcanizing natural rubber. The acid itself is made from phenol, which is under allocation by the War Production Board.

Steel Barrels and Drums. Price Schedule 43, covering used steel barrels and drums, has been modified in Amendment 2. A feature of the amendment is limitation of the ceiling to three classifications of barrels and drums only. These are the 50- to 58-gallon capacity; the 29 to 33; and the 14 to 16. These three sizes include 98 per cent of all steel barrels and drums in use. The ceiling price for raw used drums has been extended to any purchaser, instead of only the user and reconditioner as before. Other changes are specified in the amendment.

Titanium Pigments. To avert threatened increases in prices for titanium pigments, Price Schedule 98 has been announced, effective March 1. Prices established in the schedule are those prevailing October 1, 1941, and continued through to date as a result of a request made January 3 by Mr. Henderson to the five producers of these pigments to refrain from price increases. Necessity for the price schedule was emphasized by the increased demand for these pigments as a result of the national war effort, and an apparent desire on the part of dealers other than the producers to quote higher prices.

The price for titanium dioxide (regular grade), 20 tons or more, delivered in bags in eastern territory, is 14.5 cents per pound. Additional charges are permitted for lesser quantities: 5 tons or more, but less than 20 tons; 1,000 pounds or more, but less than 5 tons; and 50 pounds or more, but less than 1,000 pounds.

For deliveries in western territory, differentials, starting at 0.25 cent per pound for quantities of 20 tons or more, are permitted to be added to the maximum prices set for eastern territory. A like additional charge is permitted for delivery in both eastern and western territories in barrels.

Vitamin C. Mounting prices asked by some resellers for vitamin C (ascorbic acid)—in some cases double those charged by the producers—has caused the Office of Price Administration to issue Price Schedule 104. Price ceilings are set at approximately the prevailing prices, for producers and primary jobbers and for resellers. The quantities in which retailers ordinarily deal are not covered by the schedule. No considerable quantity is sold at retail, however, most retail sales of vitamin C being made in compounded forms not covered by the schedule.

No justifiable reasons are said to exist for producers and primary jobbers charging prices in excess of $1.65 per ounce, or for resellers charging in excess of $2.15 per ounce for sales of large quantities.

Domestic Manganese War Program Developed

To free American steel and alloy production from reliance on ocean shipping or naval convoy, the U. S. Bureau of Mines has developed a domestic manganese war program. The plan is designed to provide enough manganese to produce 87,000,000 tons of steel annually through utilization of low-grade domestic ore. Some 12 pounds of the metal are usually required for each ton of steel. The bureau will make available to industry its knowledge, experience, technical personnel, and processes and will supervise operations if industry so requests. The specific program provides for establishment of eight mills, three hydrometallurgical plants including one electrolytic unit, and one matte smelting plant. If industry is unable to undertake production rapidly, the bureau is prepared to assume responsibility for the necessary output at request of the War Production Board.

DPC Contracts with Mathieson for Magnesium Plant

Negotiations for a new magnesium plant at Lake Charles, La., have been completed between Mathieson Alkali Works and the Defense Plant Corporation. The contract calls for immediate work on a structure which will cost about $22,500,000 and will have a capacity of 36,000,000 pounds a year. Owned by DPC and operated by Mathieson, the plant will be located strategically with respect to raw materials and inexpensive fuel. Dolomite, obtainable at near-by quarries, will be used as a source.

Export of Metal Drums Controlled Further

To conserve further the stocks of steel in United States, the Board of Economic Warfare has announced new provisions covering exportation under general or unlimited licenses of metal drums and containers, filled or unfilled, for oil, gas, and other liquids and solids. The provisions became effective February 20.

Unlimited licenses authorizing the exportation of metal drums and containers, including gas cylinders, remain valid and are in no way affected by the new provisions. These licenses have been issued to the British Purchasing Commission, Belgian Congo Purchasing Commission, Netherlands Purchasing Commission, Universal Trading Corporation, and to American oil refining companies trading with other American republics.

Soap and Glycerine Advisory Committee Appointed

Formation of a Soap and Glycerine Industries Advisory Committee has been announced by the Bureau of Industry Advisory Committees, WPB. Members are R. R. Deupree, Procter & Gamble Co.; F. A. Countway, Lever Brothers Co.; E. A. Moss, Swift & Co. Soap Works; A. R. Robson, Fels & Co.; E. B. Hurlburt, J. B. Williams Co.; N. S. Dahl, John T. Stanley Co.; L. Webb, Jr., Hunnewell Soap Co.; W. C. Hardesty, W. C. Hardesty Co.; J. S. MacIntosh, Holbrook Mfg. Co.; E. H. Little, Colgate-Palmolive-Peet Co.; Dan Flick, Armour & Co. Soap Works; F. H. Merrill, Los Angeles Soap Co.; H. D. Banta, Iowa Soap Co.; Gordon Fulton, Beach Soap Co.; Russel H. Young, Davies-Young Soap Co.; R. H. Giebel, Harshaw Chemical Co.; and Werner G. Smith, Werner G. Smith Co.

Mercury Stock Pile Not Regular Supply Source

The Miscellaneous Minerals Branch, War Production Board, has asked manufacturers and contractors who use mercury in filling defense orders to obtain their mercury from the usual trade channels. The growing tendency of manufacturers is to come directly to the government stock pile. Representatives of WPB request that the stock pile be regarded as an emergency measure to be used only when mercury is not available elsewhere. If supplies are unobtainable from the usual sources, manufacturers should communicate with War Production Board, Miscellaneous Minerals Branch, Temporary "R" Building, Washington, D. C.

Dyestuffs Advisory Committee Formed

Arnold L. Lippert, Textiles, Clothing, and Leather Goods Branch of WPB, has been designated government presiding officer of the recently formed Dyestuff Manufacturers Industry Advisory Committee. Committee members are A. R. Chantler, E. I. du Pont de Nemours & Co., Inc.; E. K. Halback, General Dyestuff Corp.; S. C. Moody, American Cyanamid Co.; H. B. Marshall, Ciba Co.; Jack Crist, Southern Dyestuff Corp.; T. Thomas Roberts, Arnold Hoffman & Co.; and C. M. Richter, Pharma Chemical Corp.

VITAMINS AND DEFENSE

IN all wars since history began disease has been the cause of more casualties, both military and civilian, than the weapons of the enemy. During the last World War it began to be recognized that some of these diseases, such as scurvy, were caused by a definite deficiency of some essential ingredient in the diet while others probably spread because of lowered resistance of the population due to this and other dietary lacks. Because of their relationship to life, these essentials were termed vitamins. Since practically nothing was known about them at the time, little could be done toward correcting these deficiencies.

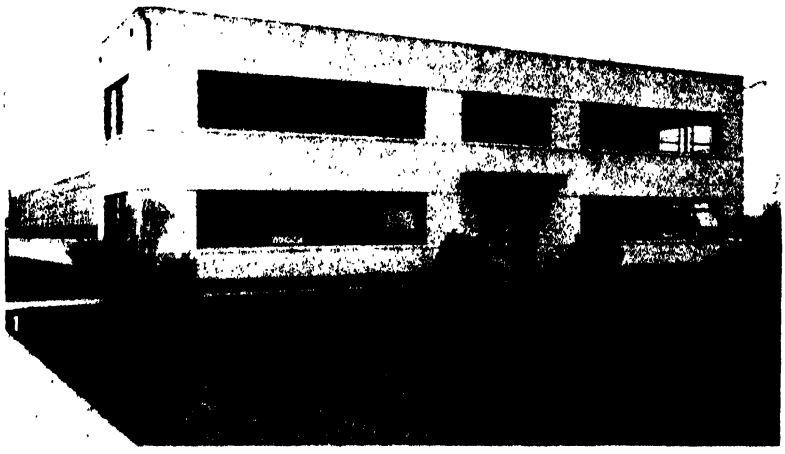
Since then science has made tremendous strides in the chemistry of vitamins. The structure of most of those isolated has been determined and methods for synthesizing many of them developed.

The nations of the world have not been slow to recognize the importance of the vitamins. In her rearmament program Germany included factories for their production along with those for manufacturing guns, explosives and other munitions of war. One important ingredient in the emergency ration of the German parachute troops has been tablets of synthetic Ascorbic Acid (vitamin C). Our own Government has also recognized the importance of this vitamin and has included a product containing synthetic Ascorbic Acid in the ration of those now training for defense of our nation both on land and sea.

The United States and the British Empire have also included the maintenance of civilian health and morale in their defense plans. Enriched flours and breads, to which a number of the vitamins together with certain minerals have been added, have received official sanction. This development has been hampered by an insufficient supply of one of the vitamin ingredients — Riboflavin (vitamin B_2).

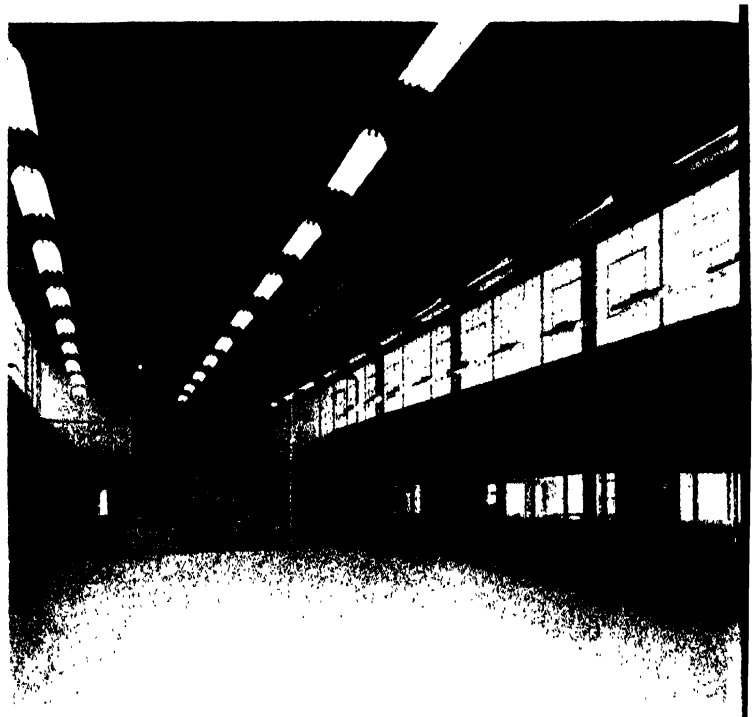
Chas. Pfizer & Co., Inc. have been glad to assist in the Defense Program. We have been one of the largest producers of Ascorbic Acid (vitamin C) for several years. There has been a continual increase in our production of this synthetic vitamin and plans are now in the process of consummation which will still further enlarge our productive facilities.

After a research program of several years, the production of Riboflavin (vitamin B_2) was started by our Company in 1940. At the present time we are bending every effort toward a great increase in the size of our productive facilities in order to assist in supplying the large quantities of this essential vitamin which are needed.



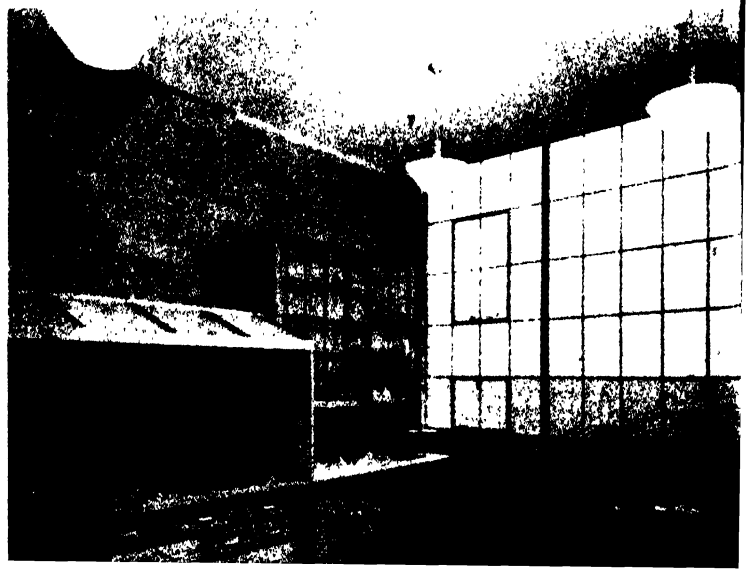
MANUFACTURING CHEMISTS • ESTABLISHED 1849

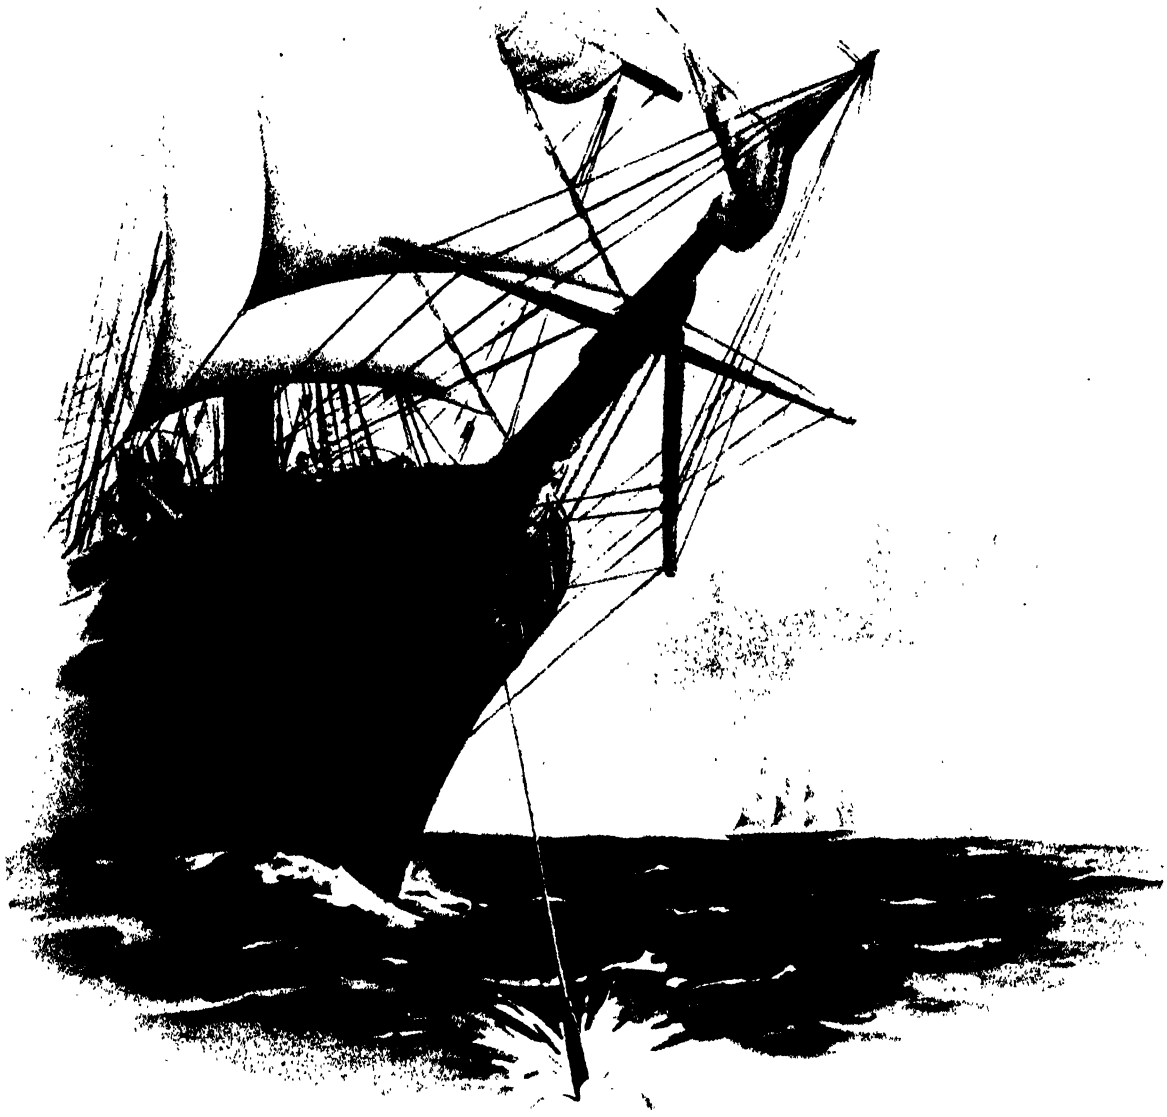
CHAS. PFIZER & CO., INC.



81 MAIDEN LANE, NEW YORK • 444 W. GRAND AVE., CHICAGO, ILL.

New Research Laboratory
Plaskon Co., Inc., Toledo, Ohio





CONTINUING its policy of expansion through research in synthetic resins and industrial applications, the Plaskon Co., Inc., has dedicated a new and enlarged laboratory. (1) General external appearance. The floor area which is devoted to aboratories is 3,500 square feet with a volume of 42,000 cubic feet. Engineering and pilot-plant space amounts to a floor area of 6,250 square feet and a volume of 137,800 cubic feet, due to the great ceiling height in this division. The laboratory has 42.5 per cent of its space devoted to engineering and pilot-plant use. Each conventional laboratory opens directly into the engineering laboratory and is separated from it by steel and glass partitions only. Artificial illumination here is obtained from 60 daylight fluorescent lamps of 100 watts each. (2) View of chemical laboratory and laboratory office. (3) Engineering laboratory. (4) Service room housing steam, vacuum, air, heating, and hydraulic equipment. (5) Another view of chemical laboratory

"BY THE DEEP—SIX!"

With a strong arm, and a quick eye, and an accurately marked lead-line, the man in the chains guarded against shoals and disaster. "By the deep—six . . . and a quarter—six . . . mark six!" he called, to show the depth of water under the keel.

Today Sharples is in charge of the lead-line in a specialized field—centrifugal engineering, pointing out the most navigable channels for its customers. It offers time-saving, efficient methods to take the place of out-moded *filtration, distillation,* and *gravity settling,* that presented problems to so many growing industries.

It offers, too, with its years of research and centrifugal background, to undertake new projects and to keep them "By the deep—six" . . . centrifugally.

THE SHARPLES CORPORATION

NECROLOGY

Lawrence J. Henderson

LAWRENCE J. HENDERSON, Abbott and James Lawrence Professor of Chemistry at Harvard, died February 11 in Boston. He was 64 years old. Dr. Henderson had been director of the Fatigue Laboratory at Harvard Business School since it was established in 1927 and chairman of the Society of Fellows at Harvard since its founding in 1933.

Born in Lynn, Mass., he graduated from Harvard in 1898, receiving his medical degree at the same university in 1902. He studied at the University of Strasbourg in 1902 to 1904 and received degrees in 1934 from the University of Grenoble and Cambridge. Harvard conferred on him a doctorate in science in 1932. Dr. Henderson became a lecturer in biological chemistry at Harvard in 1904, reaching a full professorship in 1919. During his career he served as exchange professor at the University of Paris, Silliman lecturer at Yale, Leyden lecturer at the University of Berlin, and Mill lecturer at the University of California.

He had been a member of the AMERICAN CHEMICAL SOCIETY since 1922. He was foreign secretary of the National Academy of Science and a fellow of the American Academy of Arts and Sciences. Dr. Henderson belonged to several scientific organizations and contributed to the literature. He was a member of the French Legion of Honor.

Otto S. King

OTTO S. KING, vice president and a director of the Ohio Chemical and Manufacturing Co., died February 1 at Lenox Hill Hospital, New York, after a four-day illness. Mr. King was 65 years old.

With his father, the late John M. King, he formed the King Oxygen Works, of which the Ohio company is a successor. Mr. King was organizer, former president, and honorary life member of the Compressed Gas Manufacturers Association.

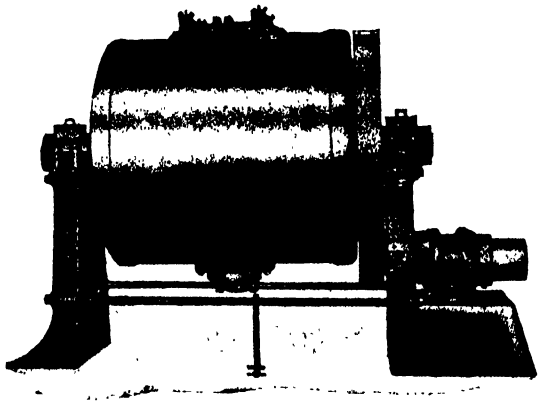
Arthur Michael

ARTHUR MICHAEL, professor emeritus of organic chemistry at Harvard University, and professor emeritus of chemistry at Tufts College, died February 8 at the age of 88.

Dr. Michael was born in Buffalo, N. Y., and was educated there and at the Universities of Berlin and Heidelberg and the School of Medicine in Paris. He was professor of chemistry at Tufts College from 1882 to 1889 and from 1894 to 1907. After devoting some years to research, he was appointed professor of organic chemistry at Harvard University, retiring in 1936.

He had been a member of the AMERICAN CHEMICAL SOCIETY for many years, and was also a member of the National Academy of Sciences. He possessed a large scientific library and a famed collection of Oriental antiques.

Ezra Frick



EZRA FRICK, president of the Frick Co., died on February 2 at the age of 86.

Mr. Frick was the son of George Frick, who in the middle of the century had established himself as a builder of steam engines. He entered the Frick Works as an apprentice in 1875 and began an uninterrupted term of active service with the firm that continued for more than 65 years. As the company grew and extended its scope, Mr. Frick became foreman of the erecting department, general clerk, purchasing agent, and in 1896 general manager. In 1924 he was elected president.

As a pioneer in the refrigerating and ice-making industry, Mr. Frick was one of the founders of the Ice Machinery Builders' Association, and its secretary in 1908. He was president of the Refrigerating Machinery Association in 1919–20, and was elected an honorary member in 1936. He was a charter member of the American Institute of Refrigeration.

OPERATION OF BALL AND PEBBLE MILLS IS AS IMPORTANT AS CONSTRUCTION!

Let us show you how to secure:

MORE SPEED

BETTER CONTROL

LOWER COST

Paul O Abbé Inc. has devoted nearly half a century to the design, construction and *operation* of Ball Mills and Pebble Mills. We are in a position to work with our customers — to help them to secure the utmost efficiency and satisfaction from their Paul O. Abb ' Mills.

All Paul O. Abbé Ball and Pebble Mills provide complete fine grinding and mixing in a single operation.

METAL INDUSTRIES

A Book List for the Metallurgist, Engineer, Physicists, Chemist, Technologist, and Plant Executives

SILVER IN INDUSTRY

Edited by LAWRENCE ADDICKS

This most modern symposium on silver, edited by Lawrence Addicks, contains the work of thirty contributors, each of whom is a specialist in the field on which he writes. The volume is in truth an encyclopedia of information on this metal and its alloys. The value of this work is further enhanced by a tremendous bibliography, containing over four thousand literature references, and a list of all the patents issued on the industrial uses of silver.

CONTENTS: The background; Properties of silver; Binary silver alloys; Ternary and engineering alloys containing silver; Technology of silver; Low-temperature bonding of silver; High-temperature bonding of silver; The use of silver in bearings; Coatings; Electroplated silver coatings; Chemical and vaporized coatings; Silver in stationary electrical contacts; Silver in moving electrical contacts; Silver as a catalyst; Corrosion Resistance of silver and silver alloys; The aligodynamic effect of silver; Silver as a fungicide; Miscellaneous; Statistics of industrial consumption; Summary and conclusions; Bibliography; Patent index, Subject index.

636 pages, profusely illustrated.....$10.00

SAMPLING AND ANALYSIS OF CARBON AND ALLOY STEELS

Prepared by the Chemists' Committee of the Subsidiary Companies of the United States Steel Corporation

CONTENTS: Sampling. Qualitative and Quick Tests for Identifying Various Types of Steel. Methods of Analysis. Chemical Separations. Determination of Manganese. Determination of Phosphorus. Determination of Sulphur. Determination of Silicon. Determination of Copper. Determination of Nickel. Determination of Chromium. Determination of Vanadium. Determination of Molybdenum. Determination of Titanium. Determination of Aluminum. Determination of Arsenic. Determination of Tin. Determination of Cobalt. Determination of Tungsten. Determination of Uranium. Determination of Zirconium. Determination of Columbium and Tantalum. Determination of Selenium. Determination of Boron. Determination of Beryllium. Determination of Nitrogen. Determination of Antimony, Copper and Molybdenum. Determination of Zinc. Determination of Cerium. Appendices — 1. Determination of Sulphur or Carbon and Sulphur by Combustion in Oxygen. 2. Discussion of Methods for Oxygen, or Oxygen, Hydrogen and Nitrogen in Steel. 3. Preparation, pH Ranges, and Color Changes of Various Organic Chemical Indicators. 4. Table of Atomic Weights, Atomic Numbers, and Other Physical Constants of the Chemical Elements.

356 pages, 20 figures.....$4.50

TIN

Its Mining, Production, Technology and Applications

by C. L. MANTELL, Ph.D.

Pratt Institute, Brooklyn, New York

CONTENTS: History. Physical and Chemical Properties of Metal. Production, Distribution and Consumption. Ores and Ore Deposits. Mining and Ore Dressing. Smelting and Metallurgy. Gaseous Reduction. Electrolytic Refining. Plating. Alloys. Hot Dipped Coatings. Foil and Collapsible Tubes. Compounds. Corrosion. Corrosion of Tin Plate by Food Products. Secondary Tin. Detinning of Tin Plate Scrap. Analytical Methods. Index.

366 pages, 91 figures, American Chemical Society Monograph, No. 51.....$5.25

SHEET STEEL AND TIN PLATE

by R. W. SHANNON

With a Foreword by BRADLEY STOUGHTON, Ph.D.

CONTENTS: Part I: Industrial Iron Products in General. Introduction. The Different Kinds of Iron Products. Part 2: Sheet Steel and Tin Plate. Definitions, Annual Production in the United States, Types of Steel Used, The Principles of Rolling Sheet Steel Products. Continuous Hot-Rolling of Sheets. The Sheet Steel Makers' Contribution to Industry. Tables Pertaining to Sheet Steel Products. The Shaping Process: Hot-Rolling and Shearing. The Refining Process: Annealing. The Refining Process: Pickling. The Refining Process: Cold-Rolling. The Refining Process: Resquaring; Flattening Operations; Oiling. Protective Coatings. The Refining Process: Metallic Coating Processes. Inspection; Forming and Painting; Preparation for Shipment. The application and use of Sheet Steel and Tin Plate (with Brief Descriptions) of Principal Grades and Finishes. Appendix "A." The Nature and Effects of the Annealing of Sheet Steel. Appendix "B." Definitions of the Terms Used Herein for Describing the Texture of Sheet Steel Surfaces. Appendix "C." Definitions of Terms Relating to the Physical Properties of Sheet Steel. Appendix "D." Abbreviations for Treatments, Finishes and Quality of Sheet Mill and Tin Mill Products. Appendix "E." How to Specify Sheet Steel Products. Appendix "F." Tolerances, or Standard Permissible Variations of Sheets in Gage Weight, Gage Thickness, Size and Flatness, Adopted by the Association of American Steel Manufacturers, March 28, 1929. Appendix "G." Notes. Bibliography. Index.

285 pages, 69 figures.....$5.00

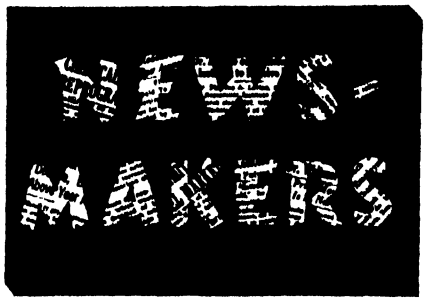
ZIRCONIUM AND ITS COMPOUNDS

by FRANCIS P. VENABLE

CONTENTS: History and Occurrence. Zirconium and Its Properties. Compounds of Zirconium with the Elements. Compounds of Zirconium with the Halogens and Their Acids. Compounds with the Acids of Sulfur and Selenium. Compounds with Acids of the Nitrogen Group and Rare Inorganic Acids. Compounds with Acids of the Silicon Group. Zirconic Acid and the Zirconates. Compounds with Organic Acids and Radicals. Analytical Methods. Technical Applications of Zirconium and its Compounds. Patents. Bibliography. Index.

173 pages, American Chemical Society Monograph, No. 5..$3.00

BEARING METALS AND BEARINGS



by W. M. CORSE

Consulting Metallurgical Engineer, Secretary, Institute of Metals Division, American Institute of Mining and Metallurgical Engineers

CONTENTS: History — Early Developments. Bearing Metals. History of Development of Bearing Metals. Types of Bearing Metals. White Metals. Bronzes. Graphite Bearing Metals. Types of Bearings. Factors Deciding Choice of Type. Bearing Design. Bearing Troubles and Failures. Testing Bearing Metals and Bearings. Lubrication. Effect of Bearing Metal on Lubricants. Bibliography — Literature References from 1900 to 1928 inclusive — Bearing Metals — General Papers. Mechanical Properties. Description and Properties of Alloys Suitable for Bearing Metals. Structure and Constitution. Mechanical Testing. Physical Properties. Effect of Various Factors on Structure and Properties. Chemical and Physico-chemical Properties of Bearing Metals and their Components. Manufacture. Bearings — General Papers on Bearings and Lubrication. Descriptions. Bearing Design. Bearing Troubles and Failures. Friction and Lubrication. Empirical Laws of Friction. Theory of Lubrication. Lubricants. Lubrication of Bearings. Testing Lubricants and Bearings. Abstracts of Selected Papers. Tables Showing Properties of Bearing Metals. Index.

383 pages, 7 figures, American Chemical Society Monograph, No. 53.....$5.25

REINHOLD PUBLISHING CORPORATION, 330 W. 42nd Street, New York, N. Y.

Arthur B. Ash has left the position of development chemist with the U. S. Rubber Co. plant at Mishawaka, Ind., to accept a position as a staff member of the Research Department, Michigan Alkali Co., Wyandotte, Mich.

C. O. Ball, since 1935 assistant director of research of the American Can Co., has joined the staff of the Owens-Illinois Can Co., Toledo, Ohio, as technical director, and will be in charge of the company's entire metal container research and development program.

Marston T. Bogert, in addition to his regular university duties as emeritus professor of organic chemistry in residence at Columbia University, has become connected with Ralph L. Evans Associates. He will aid them in study ing the many chemical problems constantly arising in the progress and development of their business and research, particularly those related to the present emergency, to the end that the present plant capacity, physical equipment, and all other resources of the organization may be devoted increasingly to wartime needs. He will also work on those problems which will confront them later in the post-war adjustment period, because of anticipated changes in chemical needs of our future way of living.

H. L. Bullock, president of Bullock, Smith, and Associates, 136 Liberty St., New York, will give two lectures on "Safety Practice in the Powder and Explosives Industry" as part of an extension course to be given at Columbia University during the spring semester.

John J. Cramer has resigned from the Procter & Gamble Co., to take a position as research chemist with the J. B. Ford Co., Wyandotte, Mich.

Grant Crane, son of E. J. Crane, Editor of *Chemical Abstracts*, has been made a captain in the Marine Corps.

Claude F. Davis is now associated with the Schwarz Laboratories, Inc., 202 East 44th St., New York, N. Y., as chief chemist in the Analytical Division.

Frank E. Dolian, Commercial Solvents Corp., Terre Haute, Ind., has reported for active duty as a lieutenant with the U. S. Army, and his work has been taken over by **Frank E. Maple**.

Robert P. Fischelis, secretary and chief chemist of the New Jersey Board of Pharmacy and member of the New Jersey State Board of Health, has been released for part-time service as Chief of the Section of Medical and Health Supplies of the Civilian Supply Division, War Production Board.

C. W. Fleetwood, who for more than four years has worked at the Indianapolis plant of the U. S. Rubber Co. as a research chemist, was transferred in October to the Munitions Division, Des Moines Ordnance Plant. After training at the Remington Arms Co. Lake City Ordnance Plant and Frankford Arsenal for the position of assistant superintendent in the Explosive Area of the Des Moines Ordnance Plant, he is now located at Des Moines, Iowa.

E. Stanley Glines has been appointed chief of the aluminum and magnesium unit of OPA. Mr. Glines recently resigned as senior partner of Glines & Co., New York bankers and industrial consultants. During the period that Herbert Hoover served as Secretary of Commerce, he was chairman of an advisory committee on Far Eastern affairs to that department. He served as chief engineer at Hog Island during the last war.

Howard A. Herder and **Vernon G. Leach** have become members of the Technical Advisory Board of Bituminous Coal Research, Inc., to guide the program at the Battelle Memorial Institute, Columbus, Ohio.

R. L. Hicks, since 1939 research chemist at the National Aniline Division of the Allied Chemical & Dye Corp., is now on the research staff of the newly formed Institute of Gas Technology, 3325 South Dearborn St., Chicago, Ill.

Harry N. Holmes, President of the AMERICAN CHEMICAL SOCIETY, was initiated into the Alpha Chi Sigma Fraternity at Akron, Ohio, on December 19 by the Gamma Chapter of the Case School at a trichapter Founders' Day in which the Cleveland Professional Chapter, the Akron Professional Chapter, and Gamma participated.

Harold W. Jackman, formerly works manager of the Battle Creek Gas Co., Battle Creek, Mich., has joined the staff of the Illinois State Geological Survey, Urbana, Ill., as chemical engineer.

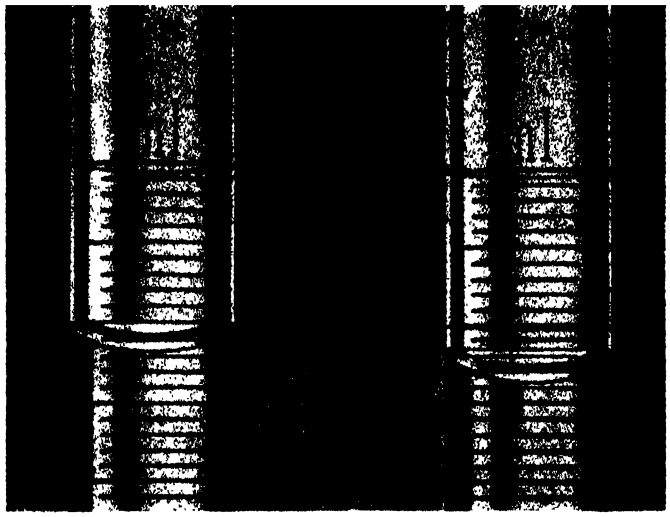
James L. Jensen is now associated with Distillation Products, Inc., Rochester, N. Y., as research biochemist in the Biological Department. He was formerly research assistant in the Department of Agricultural Biochemistry at the University of Minnesota, where he received his Ph.D. degree in December 1941.

Frederick F. Johnson has left the Mellon Institute of Industrial Research to accept the position of chief of pharmaceutical research and development, Cutter Laboratories, Berkeley, Calif.

John J. Linker has been appointed chief engineer of the Crane Packing Co., Chicago, Ill. He was formerly chief engineer of the Flintkote Corp.

Charles B. Norris is now principal engineer in charge of plywood strength and design, Division of Timber Mechanics, Forest Products Laboratory, Madison, Wis.

Alexander W. Schneider, formerly with the Geo. A. Breon Co., and more recently studying on a research fellowship at Iowa State College, has joined the research staff of the Central Soya Co., Inc., Decatur, Ill.



Homer L. Shaw has been appointed a research engineer on the technical staff of the Battelle Memorial Institute, Columbus, Ohio. He was formerly associated with the Jones and Laughlin Steel Corp.

George M. Snodgrass has been appointed manager of the Eastern Sales Division of the Sawyer Electrical Manufacturing Co., with headquarters in Cleveland, Ohio.

Harold H. Tucker, for 12 years chief chemist and dyer at the J. Laskin & Sons Corp. in Milwaukee, Wis., has become director of research of the John B. Stetson Co., Philadelphia, Penna.

Harold C. Urey, 1934 chemistry Nobelist and professor at Columbia University, will present the Edgar Fahs Smith Memorial Lecture at the University of Pennsylvania, Harrison Laboratory of Chemistry, March 20 at 4:00 P. M. Professor Urey will speak on "Physical and Chemical Properties of Isotopic Compounds".

Walter Williams, formerly in the Chicago territory, has been assigned to the St. Louis territory of Manning, Maxwell & Moore, Inc., Bridgeport, Conn., to take the place of **Harold Moore**, who has joined the armed forces.

Les Grands Problémes Actuels de la Chimie de la Houille. *Eug. Mertens* and *J. Massinon.* 2nd ed., rev. 344 pages. H. Vaillant-Carmanne, S. A., Impr. de L'Académie, Place St.-Michel, 4, Liége, Belgium, 1941.

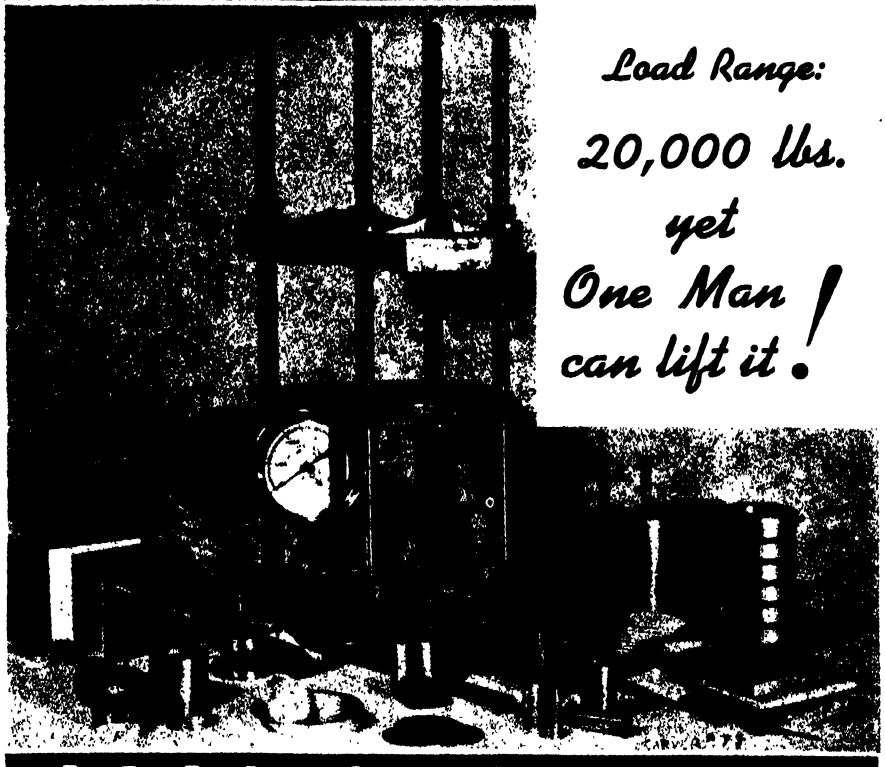
A REVIEW of constituents of coals and theories on their formation with special emphasis on the earth formations and other factors—presence of vegetation, rainfall, etc.—in southern Belgium and a comparison of changes on north-south changes in terrain are presented. Heterogeneity of coals even in the same deposit is discussed and tables for various beds show how the composition varies from roof to base of the vein, ranging in volatile material from 8.19 to 31.22 per cent.

The problem of chemical constitution of coal is difficult due to necessity of studying its geological formation. Geological phenomena proceed very slowly and are impossible to duplicate in a laboratory.

Since vegetation is the primary material in generation of coal, the chlorophyll present is involved in the synthesis of the material. The fixation of carbon is primarily a chlorophyll reaction, and the freeing of oxygen from the molecule probably occurs through the transformation of aldehydes by polymerization to soluble hexoses and a small portion of pentoses. These "hydrates of carbon" undergo a transformation to aromatic structures designated as lignins. Lignins in the course of evolution in their vegetable skeletons become insoluble materials, carbonic hydrates, and "greasy materials" immobilized in certain cells which finally produce special substances such as waxes, resins, tannins, latex, glucosides, etc.

Sugars, starches, celluloses, and lignin have a probable role in coal formation, but there is much conjecture on the influence of geologic pressures and time in coal generation. An estimated probable time involved in coal formation is of the order of 7.9×10^6 years.

Low-temperature distillation of coal with theoretical and manufacturing practices for production of semicoke are given. Generally speaking they state that the low-temperature process has had little development and so far the main uses have been for the production of semicoke. However, the light liquid products obtained have considerable economic value as nondetonating aviation motor fuels. The refined oils have interest for use in Diesel engines, and the heavier fractions from the mazut may be used for lubricating machines and for the impregnation of wood. Many millions of dollars have been spent in the United States alone in an endeavor to commercialize low-temperature carbonization of coal.



A history of the chemical and commercial development of coal hydrogenation by the Bergius process is given. The source material for this chapter is carried to 1939, and generally speaking there is no new material.

Hydrogenation of coal as a solution to the lack of indigenous oil supplies follows general lines of many papers. In discussing the economic aspect, the Falmouth Report and the Report of the British Labor Party are drawn on heavily. In respect to Belgium a quotation from the speech of the President of the National Motor Fuel Society says, "Hydrogenation of coal is capable of bringing Belgium an interesting solution to the motor fuel problem."

The Fischer-Tropsch synthesis is reviewed with a literature survey and discussion of the chemical theory. The latest reference given is for 1940; the discussion is adequate for the material presented. It makes an excellent textbook presentation since various aspects of the problem are presented and generalizations are made. Curves and tables of results for various catalysts and temperatures are given together with the influence of contact times. In addition to hydrocarbon synthesis, the importance of the production of methyl, ethyl, propyl, and butyl alcohol and the historical development is shown. Solvent extraction is a method of preparation of carbon from Belgian coal and is a new industry which has produced material of considerable value.

As a textbook or supplementary reference the work is on the whole a good review. The presentation leaves out entirely the extensive development, both in chemical research and commercial development, of the hydrogenation of oil and olefin hydrocarbons in the United States. In view of the extensive literature avail-

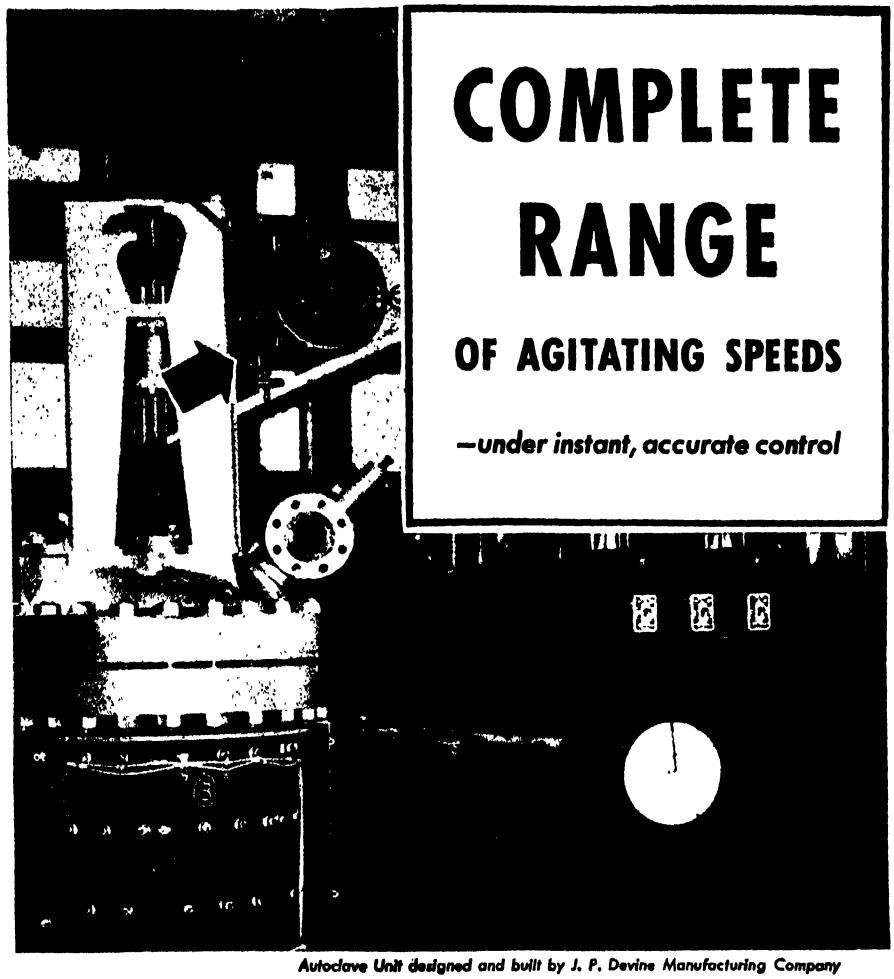
GUSTAV EGLOFF

Symposium on New Methods for Particle Size Determination in the Subsieve Range. v + 111 pages. American Society for Testing Materials, 260 South Broad St., Philadelphia, Penna., 1942. Price, paperbound, $1.25.

THIS publication includes eight technical papers presented at the A. S. T. M. spring meeting in Washington, D. C., March 4, 1941. Following a summary and evaluation of test methods by Herbert E. Schweyer and Lincoln T. Work are papers on the permeability method for determining shape and surface of fine powders, surface area of portland cement, an improved hydrometer method, and determination of subsieve particle size distributions by sedimentation methods. Use of the electron microscope is described briefly, and a new method, low-temperature adsorption isotherms, for measuring surface areas and for determining size of particles is discussed. The concluding paper covers determination of specific surface by adsorption from solution. A number of the papers include extensive bibliographies.



Abstract Service on Synthetic Resins, Rubbers, and Plastics

A LOOSE-LEAF abstract service, treating the complete field of synthetic resins, rubbers, and plastics, has been inaugurated by Interscience Publishers, Inc., 215 Fourth Ave., New York, N. Y., edited by H. Mark and E. S. Proskauer. The first issue, 33 pages, contains the table of contents and a number of abstracts of the January issues of scientific and technical periodicals. The service is to be issued 12 times a year, at a subscription price of $35 a year, which is expected to cover from 500 to 600 pages.

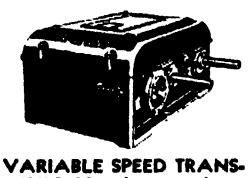
Rubber Data Chart Available

WITH a chart of the wheel-selector type, engineers with a twist of the wheel can find properties and applications for different forms of rubber. The data covers bonding, abrasion resistance, corrosion resistance, mechanical properties, energy absorption, thermal properties, and electrical properties of soft vulcanized rubber, and briefer sections on sponge and cellular rubber and on hard rubber.

The chart will be sent free of charge, post free, on request to the British Rubber Publicity Association, 19 Fenchurch St., London, E. C. 3, England.

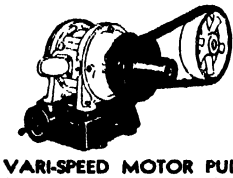
COMPLETE RANGE

OF AGITATING SPEEDS



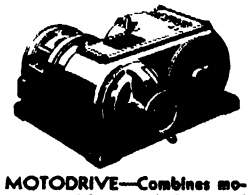
—under instant, accurate control

Autoclave Unit designed and built by J. P. Devine Manufacturing Company



This electrically heated, high pressure autoclave, shown in use in a large pharmaceutical plant, is equipped with a REEVES Vari-speed Motor Pulley which provides agitating speeds varying from 44 to 132 R.P.M. This wide range of speeds is under instant and accurate control. The exact speed required to give best results on different products can be had simply by turning a handwheel—without stopping the machine. REEVES Speed Control units are standard equipment on many leading types and makes of chemical machines, and are easily installed on machines in service. Catalog-Manual G-397 pictures and describes many helpful examples. Write for it. No obligation.

REEVES PULLEY COMPANY, *Dept. IC*, COLUMBUS, INDIANA



THE 3 BASIC UNITS IN THE MODERN REEVES LINE

VARIABLE SPEED TRANSMISSION for infinite speed control over wide range—2:1 through 16:1. Fractional to 87 h.p.

VARI-SPEED MOTOR PULLEY for application to shaft of any standard constant speed motor, 3:1 range. To 15 h.p.

MOTODRIVE—Combines motor, variable speed drive and gear reducer (if needed). To 10 h.p., speed range 2:1 through 6:1.

REEVES ACCURATE POSITIVE **Speed Control**

A. C. S. Members Elected January 1 to February 1, 1942

Total Membership as of February 1—29,008

AKRON SECTION. Paul H. Biddison[1], Thomas E. Boyle, George A. Cabaniss[1], John T. Cox, Jr., Frank V. Dunderman[1], John H. Field, Jr.[1], Raymond E. Hanning, John J. Harts, Frank A. Jeffries[1], Joseph V. Karabinos[1], Charles W. Kohler, Harold M. Leeper[1], J. Robert Lenehan[1], Charles R. Martens, Cornelius A. Papp[1], Carl Pettyjohn[1], Gail C. Rogers[1], G. F. Roquemore, Norman St. Landau[1], A. W. Schatzel[1], Stephen T. Semegen[1], Victor F. Springer[1], Alvin W. Warren[1], Frank P. Wetterau[1].

DENSITY CONTROLLER for PULPS

The Masseo-Adams Density Controller, first used in ore classifiers, now has many applications in non-metallic and chemical plants—including potash and phosphate plants, washing coal, etc. Maintains *visual* control of density by motor-operated regulation of dilutant supply valve. Also available with standard chart recorder or with arm and weights for sink and float process. Widely optional location. *In writing, please describe your problem.*

. . . Because these tanks are made from Jessop SILVER-PLY Stainless-Clad Steel*

The battery of tanks shown in the illustration are for the transportation of bulk grain products. No severe corrosive conditions are encountered, yet the owner wanted to prevent any chance of contamination so he used stainless equipment. At the same time, he wanted to hold down material costs. The natural solution to his problem — and the one he used successfully — was to have his tanks made from Jessop SILVER-PLY Stainless-Clad Steel. The stainless steel cladding on the inside provides the same protection as solid stainless while the mild steel backing reduces the material costs.

It is more important today than ever before to consider the use of Jessop SILVER-PLY Stainless-Clad Steel for processing, handling, and storage equipment. . . because equipment made from SILVER-PLY requires far less shutdown time for cleaning than non-stainless equipment; in addition the use of SILVER-PLY in place of solid stainless conserves strategic stainless alloys. If you are not familiar with Jessop SILVER-PLY Stainless-Clad Steel write today for our 24-page descriptive booklet and our new price list.

*** Produced under U. S. Pat. Nos. 1,997,538 and 2,044,742**

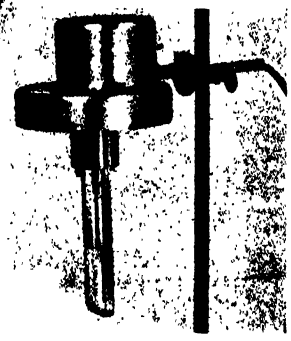
JESSOP STEELS FOR AMERICA AND HER ALLIES

CARBON · HIGH SPEED · SPECIAL ALLOY · STAINLESS · COMPOSITE STEELS



MAKE VISCOSITY TESTS AT POINT OF PROCESS

with a

Brookfield Synchro-lectric VISCOSIMETER

VARIABLE SPEED UNIT Four speed changes regulated by finger-controlled lever.

SINGLE SPEED UNIT for use where speed variations are not required.

***SAVE* valuable production time** and insure closer control on defense orders by running viscosity tests direct in plant containers where your material is being processed.

***NOTE* these advantages:** Continuous or intermittent indicating — Simple, sturdy, easy to operate and clean — Permanently standardized, no adjustments.

Operator can easily convert any model to either portable or stationary use as desired.

The Synchro-lectric Viscosimeter operates anywhere in *plant* or *laboratory*. It will test solutions in suspension and of any degree of opacity, and is not affected by temperatures to 600°F. Just a few seconds are required to complete the reading which requires no technical skill. The instrument is permanently standardized, requires no adjustments. Viscosities are indicated in *centipoises* in wide ranges on a large, easily read dial. Accuracy is within one percent of full scale based on Bureau of Standards values.

Variable speed units provide a means for measuring materials of plastic flow at different rates of shear.

Standard units operate on 60 cycle, 110 volt current but can be equipped for other frequencies and voltages.

Full information with recommendations will be sent on request.

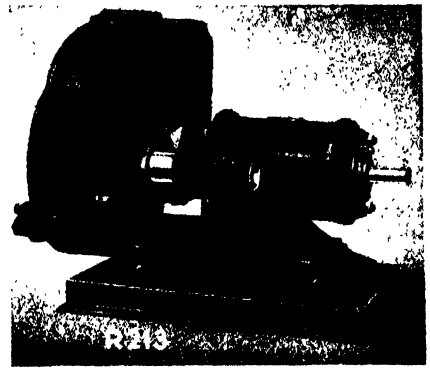
. . . Operating Efficiency of Amsco-Nagle Pumps Results from Design Simplicity . . .

The need for conserving vital metals and man-power makes the use of Amsco-Nagle Horizontal and Vertical Shaft Centrifugal Pumps all the more important.

Their simplicity of design effects an operating efficiency that minimizes the replacement cost of bearings, packing and other parts. When such maintenance is necessary, it can be accomplished quickly and easily and without the customary pump dismantling.



In the horizontal pumps the casing and the bearing stand are held rigidly together by tubular supports. (In the vertical shaft series these tubes also function as discharge pipe and lubricating duct respectively.)

Amsco-Nagle Type "A" Horizontal Shaft Pumps are self-priming without the use of ducts or jets or the need for recirculation. Submerged bearings and their attendant troubles are eliminated in the Type "QW" Vertical Shaft Units. Bearings are supported in a rigid, fully enclosed column. The Types "SD" and "SW" have steadying and intermediate sleeve bearings supported in split yokes which make them simple to replace. They are readily lubricated from above the floor plate.

Impellers, casings, and plates can be made of abrasion or corrosion resistant materials best suited to the liquid or solids in suspension being handled. Impellers of various types are available, depending on the nature of the application. They are screwed onto the shaft, simplifying installation.

Amsco-Nagle Pumps are available in capacities in the range of 7,000 g.p.m. for heads of 200'. Vertical shaft units are available for wet or dry pit application. Horizontal types can be furnished with pulley or for direct connection.

Check the design and operating advantages of these sturdy pumps for the chemical and processing industries; determine for yourself how they can help save time and cut costs during this critical period—send for Bulletin 940.

Note accessibility of stuffing box on this Amsco-Nagle 1½" Type "A" Frame 7 Horizontal Pump (R213). Casing can be removed after loosening nuts on bolts clamping the tube supports.

Impeller is screwed on. Water end on horizontal pumps held on by three clamp-dogs. This is a 2" Type "T" Frame 10 unit (R222).

Pumping end, bearings and floor plate are rigidly tied together by tubular members which also function as discharge pipe and lubrication duct, respectively, in this 2" Type "SW" Frame 10 Amsco-Nagle vertical shaft pump (R282) which has a setting (or submergible length) of 14 ft.

New Porcelain Glaze Developed

In the search for substitutes to replace national strategic materials, the chemists of Westinghouse, East Pittsburgh, Penna., have developed a new porcelain glaze which has increased the strength of porcelain more than 100 per cent, made manufacturing easier, and imparted better weather resistance. Ralston Russell, Jr., research engineer, is pictured recording the results of a tension test on the new type porcelain insulators.

Ethyl Turns Research to War Needs

MERGER of all technical services to provide maximum cooperation with the oil and automotive industries and organization of a War Committee to adapt

Julian J. Frey

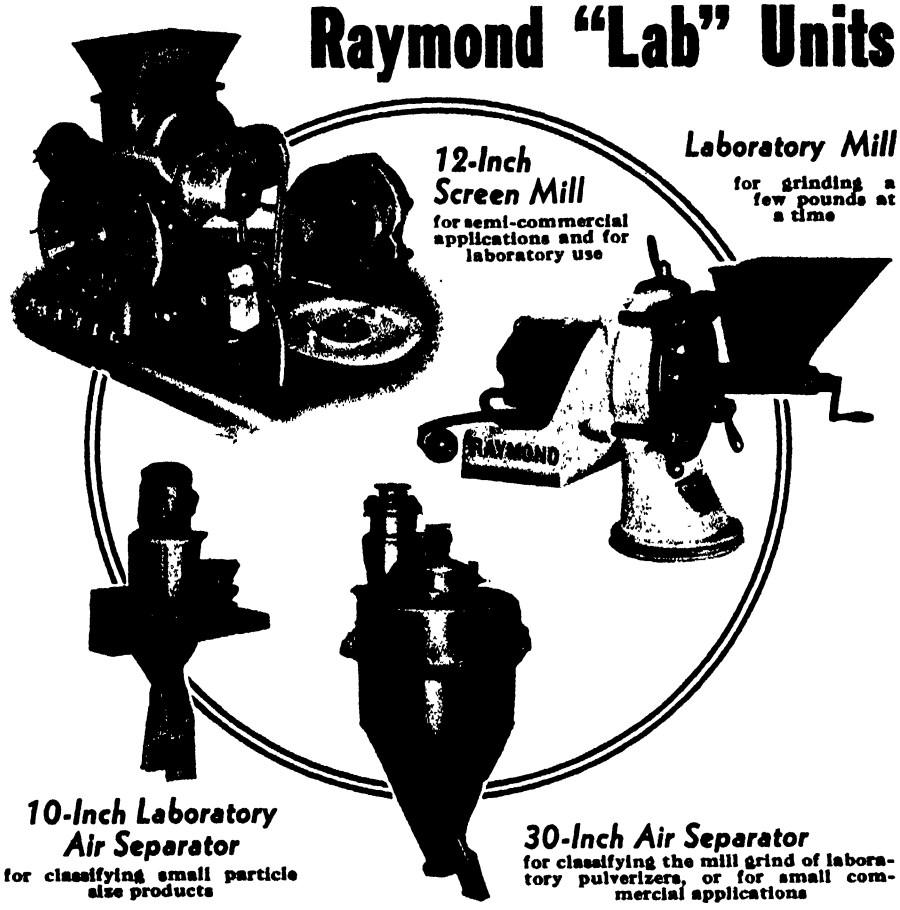
the company's research facilities to the needs of the armed forces are announced by the Ethyl Gasoline Corp. Both the newly established Technical Service Department and the War Committee are headed by Julian J. Frey of Detroit, manager of the Technical Sales Division since 1930.

Five divisions have been incorporated into the new department. Managers are: Refinery Technology Division, William H. Hubner; Gasoline Testing Division, John Clifford Pope; Agricultural Division, C. G. Krieger; Truck, Bus, and Fleet Division, Errol J. Gay; and Passenger Car and Automotive Accessories Division, Richard K. Scales.

Members of the War Committee are Julian J. Frey; Earl Bartholomew, director of engineering laboratories; George Calingaert, director of chemical research; Graham Edgar, vice president; S. D. Heron, director of aeronautical research; and O. E. Kurt, manager of manufacturing technical division.

Chemistry Advisory Council Discontinued

BECAUSE of greatly changed conditions the Board of Directors of Chemist Advisory Council, Inc., has voted to discontinue the present activities of the council. The office at 60 Madison Ave. has been closed. The organization will be maintained and valuable records preserved so that the work of the council may be resumed when a need arises. The cooperating committees all over the United States are asked to continue so that they may be called upon whenever the council's services are needed. Any correspondence regarding the council may be directed to W. T. Read, Rutgers University, New Brunswick, N. J.



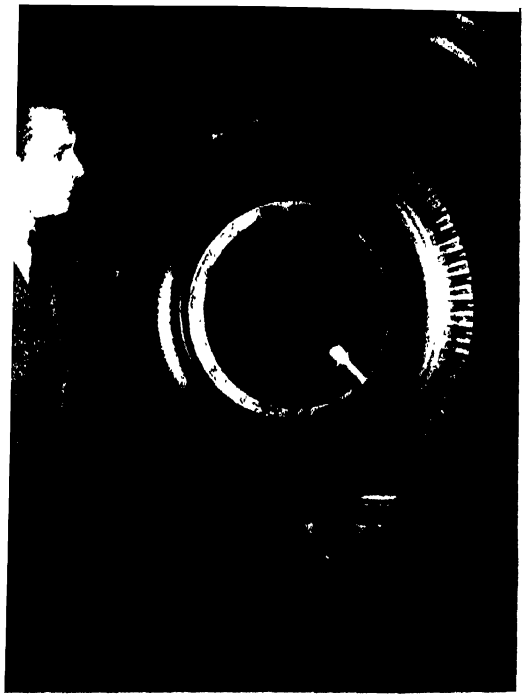
Swift Research Grant Set Up

THE University of Nebraska has received from Swift & Co., Chicago, a grant for research on nutritional anemia in relation to pregnancy and lactation, under direction of Ruth M. Leverton. Dr. Leverton, who received her Ph.D. from the University of Chicago in 1937, has already done some work on the treatment of nutritional anemia in young women which indicates that a liberal amount of meat in the diet of pregnant and lactating women may prevent the common occurrence of nutritional anemia. These studies are to be continued under the present grant.

Phi Lambda Upsilon Elects Officers

WILLIAM N. SANDSTROM, University of Minnesota, was re-elected national president of Phi Lambda Upsilon at its recent election. T. F. Buehrer, University of Arizona, for 12 years national secretary-treasurer, became vice president. L. F. Audrieth, University of Illinois, again will serve as editor of the *Register*, and secretary and treasurer are C. S. Carlson, University of Pennsylvania, and Herschel Hunt, Purdue University. Phi Lambda Upsilon now has 38 chapters with an active and alumni membership exceeding 11,000.

Raymond "Lab" Units



PRODUCT CONTROL now is more important than ever in the manufacture of essential powdered materials. For this purpose, Raymond offers a practical line of small capacity pulverizers and air separators for conducting tests and developing new products.

These machines are specially designed for experimental work and minor industrial applications. They produce the *same character of finished material* as the large commercial pulverizers and air separators, a feature of particular advantage in laboratory research.

For complete details of these "pilot units," send for RAYMOND Laboratory Bulletin No. 48.

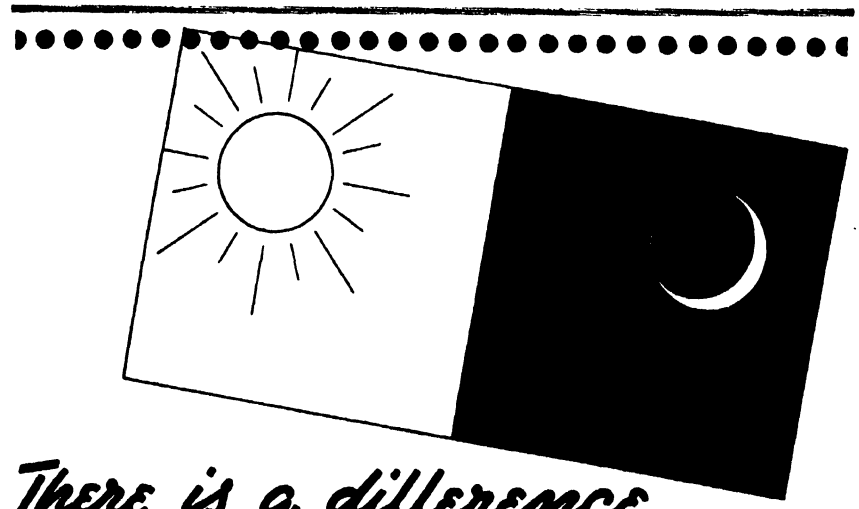
Reclaimed Rubber Victory Tires

Harvey S. Firestone, Jr., president of The Firestone Tire & Rubber Co., examines one of the company's new Victory passenger car tires made entirely of reclaimed rubber as it comes off the production line. Firestone is also developing a line of tractor and farm implement tires of reclaimed rubber. The new product will give reasonably satisfactory service at moderate speeds. Firestone is the largest producer of reclaimed rubber in the world.

Weak Illumination for Use in Blackouts

C. S. French, Department of Botany, University of Minnesota, Minneapolis, Minn.



THE recent article by Henry E. Millson[1] discusses some extremely interesting and useful applications of both fluorescent and phosphorescent substances to the production of weak illumination sufficient to maintain normal life during blackouts. That author, perhaps rightly, objects to lamps emitting infrared because of the possibility of airplanes being equipped with infrared detectors. It would seem still more likely, however, that the wide use of ultraviolet lamps which he advocates would make ultraviolet photography with quartz lenses a very profitable procedure, indeed, for an invading air force.

To prevent pedestrians being run over and to supply a small beam of light wherever needed, it might be well to supplement the fluorescent and phosphorescent fixtures by advocating the wide use of an appropriately designed flashlight.

The problem resolves itself into supplying very weak illumination upon the object without the lamp itself being visible. This requirement is well met by a beam of light restricted to a small angle such as comes from a pen type of flashlight with an 8-inch black paper tube the size of a pencil slipped over the end of the bulb. The lamp is then practically invisible, unless pointed directly at the observer, yet gives adequate light for reading street signs and house numbers at a range of 15 feet. If the tube were made of some plastic material colored deep green or blue and painted flat black over most of the inside, it should be possible to have enough light emitted diffusely from its entire surface to prevent the person using it from being run over and yet not be visible from any distance. For such use the hole in the tip might be fitted with a removable plug or shutter. Such flashlights presumably could be designed to sell for a few cents each.

For signs, house numbers, and warning signals the widespread use of phosphorescent paint would seem to be of great advantage. It is, however, difficult to understand the advisability of using large fluorescent or phosphorescent screens as light sources for illuminating other objects. Whatever arrangement is devised the light itself would inevitably be brighter and more conspicuous than the material to be illuminated. Furthermore, it is not possible to control the direction of the light emitted from a large diffuse source. A relatively brighter small aperture beam of light giving the same illumination upon any object would appear to be far less dangerous than a large diffuse source. It is, however, essential that the direction of the beam be properly controlled and not pointed at the sky.

Movie on Gelatin Manufacture

A SOUND motion picture made available by the Gelatin Products Co., 9425 Grinnell Ave., Detroit, Mich., traces the manufacture of gelatin capsules from its inception in France over a century ago to the present day. Diagrammatic illustrations point out the accuracy of the rotary die process. The picture also shows the inspection and control activities employed by the company, with views of the engineering department, machine shop, and laboratory.

Albert A. Haniford has been appointed to the Sales Department of Manning, Maxwell & Moore, Inc., Bridgeport, Conn.

A. D. Whipple, chief engineer of Alladdin Industries, Inc., has changed his residence from Alexandria, Ind., to 5241 North Kimball Ave., Chicago, Ill.

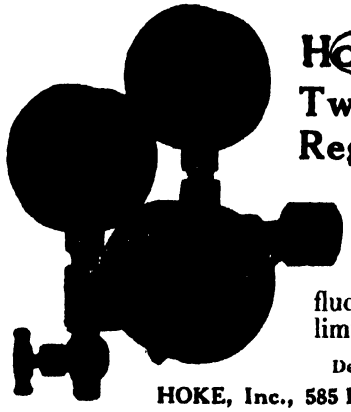
Motion Picture Shows How to Fight Incendiary Bombs

THE first film authorized for training purposes by the Office of Civilian Defense, entitled "Fighting the Fire Bomb", is being distributed. It is accompanied by an instruction manual containing supplementary lectures, material for a quiz based on the film, and other instructional material. The film was produced by Transfilm, Inc., under the technical supervision of the Chemical Warfare Service and the National Fire Protection Association. The Instructor's Manual was produced by the Safety Research Institute.

Copies are made available to state and local defense councils by the Office of Civilian Defense. Prints of the film and copies of the manual may be purchased from Transfilm, Inc., 9 Rockefeller Plaza, New York, N. Y., at $38 for the 16-mm. print in black and white, $68 for the 16-mm. color print, and $65 for the 35-mm. in black and white. Single copies of the manual are sold for 50 cents.

Stuart J. Saks, assistant to the president of Morris Machine Works, Baldwinsville, N. Y., for the past two and a half years, has been elected president of the company.

Film on Sulfur Production Available



THE Story of Sulfur" is the latest addition to the U. S. Bureau of Mines' library of films in sound visualizing the mineral and allied industries. The film, prepared under supervision of the bureau and a large sulfur-producing company, is 16 mm. in size and requires 25 minutes for projection. Applications for copies for exhibition should be addressed to the Bureau of Mines Experiment Station, 4800 Forbes St., Pittsburgh, Penna., and should state specifically that the borrower is equipped to show sound film. Transportation costs and payment for any damages are the only charges.

Monsanto Employees Move to Conserve Rubber

CONSERVATION-CONSCIOUS Monsanto has a new club—the first of this type CHEMICAL AND ENGINEERING NEWS has heard about. Monsanto Share-Your-Car Club are being formed in 14 plants and 10 branch offices to pool transportation so that employee-owned cars will carry capacity passenger loads. Badge of membership is a red, white, and blue sticker on the automobile window.

STEAM JET EVACTORS
AIDING NATIONAL DEFENSE

Numerous Croll-Reynolds Evactors are working overtime maintaining high vacuum in plants making explosives, synthetic rubber, airplane lubricants and a long list of other ordinance materials. They are maintaining high vacuum on engines and turbines of dozens of American ships sailing the seven seas.

While the large and special units require up to three months or more for fabrication the smaller ones are sometimes made in two weeks, or less, when the demand is urgent. These include single and multi-stage units for vacuum up to a small fraction of 1 mm. absolute, also small condensers and vacuum chilling equipment.

A recent development is a vacuum-cooled condenser for maintaining condensing temperatures down to 34° F. Inquiries will be handled as promptly as possible under the circumstances.

INDUSTRIAL CHEMISTRY of COLLOIDAL and AMORPHOUS MATERIALS

By Warren K. Lewis, Lombard Squires & Geoffrey Broughton

An important new book for the modern chemical engineer, particularly those producing new synthetic materials. It is written by three men who have had wide industrial as well as research experience. Warren K. Lewis is Professor of Chemical Engineering, Massachusetts Institute of Technology. Lombard Squires is Chemical Engineer with E. I. du Pont de Nemours Co. Geoffrey Broughton is Chemical Engineer with the Eastman Kodak Company.

Devoe & Raynolds Co.	249,920	1,178,188	1.16	7.08

The **Atlas Powder Co.** reports that 1941 was a year of intense activity in all major departments. Sales and other operating revenues amounted to $34,517,750, an increase of 68 per cent over 1940. Sales of products for direct military use, plus fees received for work on government-owned ordnance plants, represented approximately 28 per cent of the total sales and operating revenues. Sales of commercial products increased 45 per cent over 1940. Federal income, excess profits, and capital stock taxes were $4,621,214, compared with $1,105,891 in 1940. The number of employees at the close of 1941 was 4,380, compared with 3,104 at the close of 1940.

E. I. du Pont de Nemours & Co., Inc., reports that sales and other operating revenues were about 40 per cent greater in 1941 than in 1940, while net income was about 4 per cent greater, principally because of higher federal taxes. Total taxes in 1941 were equivalent to about 127 per cent of earnings available for dividends, compared with 65 per cent in 1940. During 1941, $50,600 was expended for plant construction, 68 per cent for additional capacities, and 32 per cent for renewal and betterment of equipment and facilities. The company is constructing and operating a number of new plants for the Government.

The Devoe & Raynolds Co., Inc., reports that on November 30, 1941, it completed the most successful year in its history, both sales and profits establishing new records. All divisions of the company are now concentrating heavily on war business. During the year the company sold 29,000 shares of 5 per cent cumulative preferred stock at $101 a share, using the proceeds to redeem 15-year 4.25 per cent sinking fund debentures and 7 per cent cumulative preferred stock.

Rheostat Cages

A variety of rheostat cages have been developed by the Ohmite Manufacturing Co., 4835 Flournoy St., Department 9B, Chicago, Ill., for use with Ohmite rheostats. A cage enclosure is a convenient form of table top or surface mounting and is advisable where there is possibility of mechanical injury to the rheostat or human contact with electrically "live" parts.

Ventilated cages with perforated sides are most generally applicable. Other types available are dustproof cages, cages to house rheostats in tandem, explosion-proof cages, ventilated cages with one half closed as a splash guard, and laboratory type semienclosed table-top cages.

Branding Tires

To combat the growing wave of tire thefts, The Firestone Tire and Rubber Co.'s dealers and stores will give motorists theft protection by branding their initials on the sidewalls of their tires. Branding also facilitates the tracing of tires that may have disappeared.

The motorist who utilizes the extra mileage plan is assigned a specific day on which to bring his car in each month for a bumper-to-bumper inspection. To speed the branding, service men will use a special electrically heated iron.

Ultra-Violet Products, Inc., 5205 Santa Monica Blvd., Los Angeles, Calif., announces a new model of Mineralight, ultraviolet ray black-light lamp, useful for identifying the tungsten ore scheelite and other minerals which also fluoresce under black light.

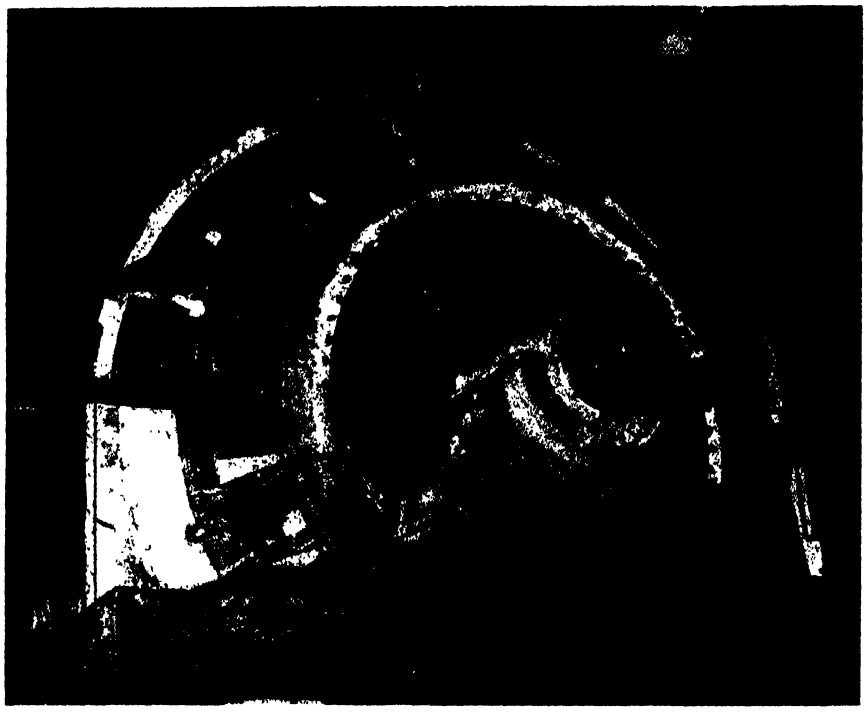
PARR INSTRUMENTS



THE
PARR VM CRUCIBLES

Specifically for the determination of volatile matter in coal and coke, these crucibles have become widely accepted. Their features are light weight, uniform wall thickness, and the ability to withstand repeated heating to 1000°C. without appreciable change in weight. They are useful in a variety of laboratory procedures where extreme resistance to corrosion is not essential.

For further details, obtain a copy of Bulletin E-65 from your laboratory supply house or write direct to:

PARR INSTRUMENT COMPANY · Moline, Ill.

Rotary Converter

An important element in the gasoline that powers America's fighting planes is created by an electrolytic process requiring direct current. This 5,440-kw. rotary converter nearly ready for shipment at the Westinghouse East Pittsburgh works soon will be installed at a Niagara Falls chemical plant. Operating from a 6-phase, 25-cycle line, the unit will deliver direct-current power at 135 to 355 volts, 16,000 amperes. The armature spider acts as a fan and eliminates brush dust by a special ventilating design.

Fiberglas Replacing Strategic Materials

As a new basic material made of ingredients plentiful in the United States, Fiberglas is assuming rapidly increasing importance in replacing scarce strategic materials such as cork, aluminum, nonferrous asbestos, and mica.

In several of its fabricated forms Fiberglas is replacing aluminum—for instance, fiberglas-insulated cables can be used without metal conduits in airplanes. Fiberglas is taking the place of cork in certain types of low-temperature insulation. In the manufacture of ground insulation for electrical equipment, Fiberglas is combined with mica, and Fiberglas electrical insulation is replacing asbestos in electric motors, generators, and transformers.

Electric tapes woven from glass fibers show greater tensile strength than similar electric tapes made of either cotton or asbestos, and this strength is retained through a temperature range rising well above that at which other tapes are destroyed.

Savings in both space and weight have been made possible in the manufacture of magnetic type electrical equipment, such as Class B motors, built on frames a size smaller than was formerly standard for a given power output. Use of Fiberglas thermal and electrical insulation in a modern battleship makes possible a saving of approximately 60 tons, equivalent to the weight of munitions required to fire four to five salvos from the main battery, or of enough fuel oil to give the vessel six additional days away from its base.

Gas Purification Plant

The Girdler Corp., Louisville, Ky., is proceeding with the design and erection of a Girbotol plant to purify and dehydrate 25,000,000 cubic feet per day of condensate-separator gas from the McKamie, Ark., field for the McKamie Gas Cleaning Co., of Arkansas. This is the first purification plant designed to produce a marketable gas from this extremely sour field. The gas, which contains about 4,500 grains of hydrogen sulfide per 100 cubic feet and approximately 5 per cent carbon dioxide, will be purified to pass the very sensitive Bureau of Standards test for hydrogen sulfide.

A gasoline recovery plant will also be erected and later it is planned to add another plant to convert the recovered hydrogen sulfide to elemental sulfur, sulfuric acid, or some other useful product.

Victor Chemical Employees Victory-Minded

The Victor Chemical Works, Chicago, Ill., report that 99.48 per cent of the employees at all plants and offices have voluntarily subscribed to the defense bond purchase plan. Employees may purchase Defense Bonds, Series "E", of any denomination from $25 to $1,000, through pay-roll deductions of from 50 cents per week up. A special Bond Savings Fund is set up by the company for the employee and when enough is accumulated in that fund, the bond is purchased and given to the employee.

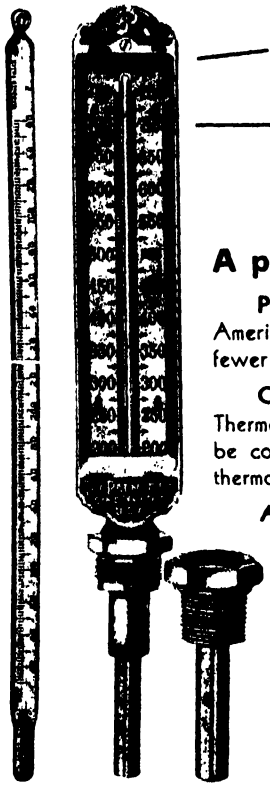
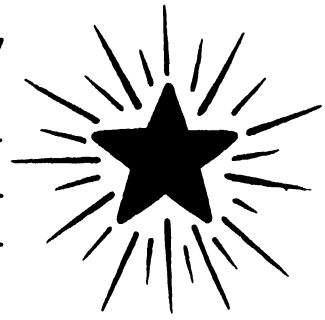
Stainless Steel Equipment Fabrication. This 16-page booklet contains suggestions to aid the engineer who is designing or specifying stainless steel processing equipment. The welding of stainless steel is discussed in detail with a series of drawings indicating good and poor procedure. *What to Look for When You Specify Stainless Steel Booklet IE.* S. BLICKMAN, INC., Weehawken, N. J.



Steam Traps. Float-thermostatic steam traps, compressed steam traps, and liquid level controls are fully described in an 8-page bulletin. Complete information on sizes, capacities, and installation details is included. *Bulletin 450 IE.* SARCO CO., INC., 475 Fifth Ave., New York, N. Y.



Steam Turbines. Two pamphlets cover the design and construction of steam turbines, with and without reduction gears. *Bulletins 1951 and 1955 IE.* MOORE STEAM TURBINE DIV., WORTHINGTON PUMP AND MACHINERY CORP., Harrison, N. J.

Temperature Control for Galvanizing Kettles. Close control of temperature of galvanizing kettles is important because the type of coating is dependent upon the spelter temperature, and the life of the kettle is dependent upon keeping the temperature within certain limits. Designed for fuel fired kettles, this control system is described in technical detail. *Bulletin 38-4 IE.* THE BROWN INSTRUMENT CO., Wayne and Roberts Aves., Philadelphia, Penna.

Tramrail Conveyors. A 12-page booklet describes and illustrates equipment and many applications of interest to anyone using overhead conveyors. *Booklet 2008-A IE.* CLEVELAND CRANE & ENGINEERING CO., 1191 East 283rd St., Wickliffe, Ohio.

A New STAR To Follow In 1942

ECONOMY!

A paramount Issue of the Day

Palmer Thermometers, made with extreme care, by skilled American workmen, mean extra life to these instruments, and fewer repairs.

Careful annealing, which is a feature of every Palmer Thermometer, gives you a round dollar value, which should be considered before you sign your next order, for any thermometers.

And "Red-Reading-Mercury" . . . the easy to read RED column, costs you no extra. Buy thermometers that will give you real service.

THE PALMER CO., MFGRS.

Industrial, Laboratory, Dial and Recording Thermometers

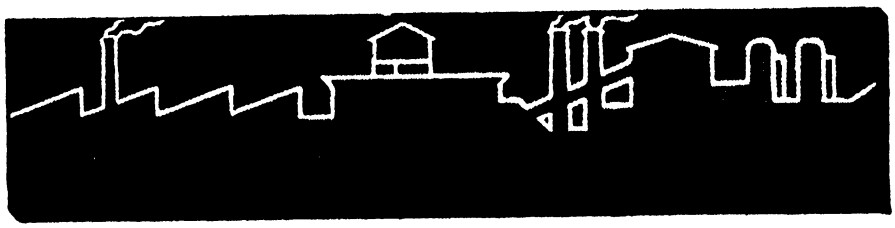
2517 Norwood Ave., Cincinnati, Norwood, Ohio

Canadian Plant: King and George Sts., Toronto

High-Pressure Power Pumps

A LINE of high-pressure vertical triplex constant-stroke pumps has been developed by the Aldrich Pump Co., Allentown, Penna. The pumps are of various sizes from 10 to 150 h. p. for pressures up to 9800 p. s. i. and capacities up to 220 g. p. m. Improved design makes the pump particularly applicable to gear-head motor or speed-reducer drive. Provision has also been made in the larger sizes for the use of built-in gearing, or belt direct to crankshaft.

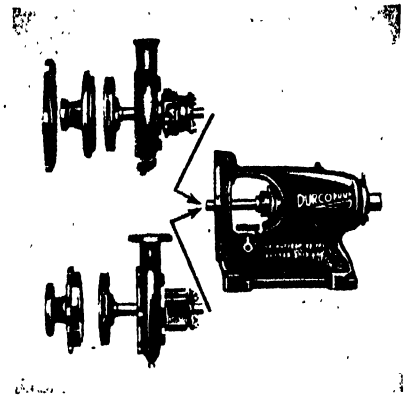
These pumps can be fitted with synchronized suction valve control for services such as central hydraulic accumulator systems where several presses are in constant operation. For special process work at the high pressures encountered in oil refining and the chemical industry the outboard plungers are sealed dust- and weather-tight with a removable cover.



High Impact-Resistant Phenolic Molding Plastic

THE Bakelite Corp., unit of Union Carbide and Carbon Corp., New York, N. Y., has announced the development of a new impact-resistant phenolic molding plastic, designated as Bakelite phenolic resin XM-15000, that can be preformed on automatic tabletting machines.

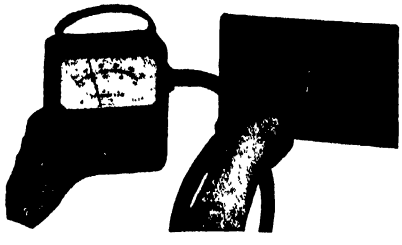
When molded it has approximately twice the shock resistance of general-purpose phenolics. Its water resistance is also good when compared with other shock-resistant phenolic plastics.



Corrosion-Resisting Valve Capacity

JENKINS BROS., 80 White St., New York, N. Y., announces that it has materially increased productive capacity of corrosion-resisting alloy valves. The line of globe, angle, Y, and check valves has been augmented by solid wedge and double disk-taper seat gates in sizes to 6 inches. Another innovation is "certified castings", each casting being x-rayed as well as pressure-tested.

Convertible Chemical Pump



A NEW series of corrosion-resisting pumps in which it is possible to get 480 combinations of alloys, types, and sizes with heads and capacities to meet practically any requirements was displayed at the recent Exposition of Chemical Industries by The Duriron Co., Inc., Dayton, Ohio.

Durcopumps that are made in the high-silicon irons, Duriron and Durichlor, can be converted to stainless steel pumps by substituting the wet-end parts. The exchange can be made without disturbing the setting of the pump.

Other features include the interchangeability of newly designed open and closed impellers with negative pressure on the stuffing box, oversize ball bearings throughout, and microadjustment of the impeller to obtain maximum efficiency.

Intake or Exhaust Grille Jet

THE Illinois Testing Laboratories, Inc. 420 North LaSalle St., Chicago, Ill., offers a new intake air exhaust grille jet, developed for use with the Velometer. This jet has two calibrated air intake openings, one at the end of the main member. This member forms a compensating tube and extends from the grille face outward from or beyond the critical suction zone.

At right angles to this main member is a branch tube also calibrated, to which is attached the flexible tube connecting the jet to the Velometer. The air actuating the Velometer movement is inspirated through this branch tube by the force of the suction exerted upon the main member or compensating tube.

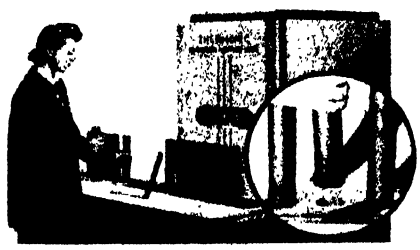
Portable Still

THE necessity for full recovery of chlorinated solvents (used principally in vapor-type degreasers) in industrial plants brings a development by the Phillips Manufacturing Company, Chicago, Ill., of an electrically operated and controlled, fully automatic, air-cooled, portable still and condenser.

All heaters and controls are mounted integrally on the easily removed pot head, assuring easy cleaning and servicing, as well as easy access to the pot with no fixed fittings on the interior to trap solids.

The collector chamber of the condenser tower is fitted with a moisture trap to ensure removal of water which may be in solution with dirty batches, and the clean solvent discharge pipe is at a level permitting draining into a standard drum lying on the floor.

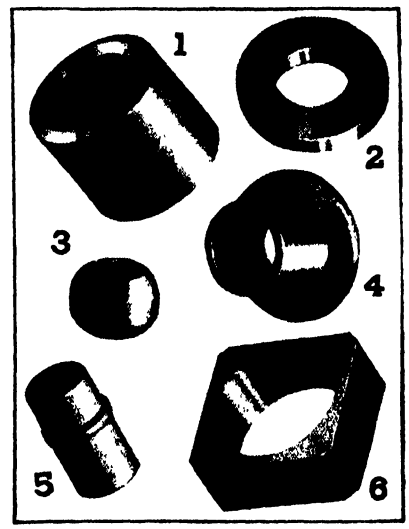
Sewage and Sludge Sampler



THE P. F. T. sewage and sludge sampler for sampling still or flowing liquids without disturbing the liquid bodies or contaminating the samples, has been introduced by the Pacific Flush-Tank Co., 4241 Ravenswood Ave., Chicago, Ill.

The unit consists essentially of a metal cylinder with an inflatable rubber valve at each end, supported at the axis of the cylinder. On one side is a sample withdrawal cock and a vent cock. The valves are closed, the unit is lowered to the desired depth in the medium to be sampled, and after the liquid has flowed through the cylinder for a few moments the valves are again inflated, closing both ends of the unit.

Brazing Equipment



THERMONIC Induction heating, applied by push-button control to brazing units of work at the rate of 10,000 a day, has been developed by the Induction Heating Corp., 389 Lafayette St., New York, N. Y.

The temperature is controlled exactly to the brazed area and adjoining areas, with no annealing beyond, and no metallurgical change. Seven units are brazed at one time, using a silver-brazing alloy which gives a strong joint free from internal oxidation.

Porous Iron Bearings

THE Keystone Carbon Co., Inc., 1935 State St., St. Marys, Penna., announces the addition of Selflube porous iron bearings to its line of self-lubricating bronze bearings. The new bearings are stronger than porous bronze bearings, and are interchangeable with them in most applications. They were introduced to conserve copper and were perfected after years of research work in the company's laboratories.

The bearings are made from powdered iron, which is molded to size in the shape desired, then baked, and finally saturated with a good grade of oil. They have an average porosity of 25 to 35 per cent, enabling them to store a large amount of oil which forms a protective, continuous oil film on the bearing surface.

Rustproofing Solution

RUSCAT is a new rustproofing and metal cleaning solution developed by the Research Laboratories of The United States Stoneware Co., Akron, Ohio. Its principal use is for the cleaning and preparation of metal surfaces before the application of corrosion-resistant paints and coatings and for preventing further rust formation.

Its use produces a mild etch over metal surfaces, resulting in the development of a chemically adherent inorganic base over which the lacquers and coatings are made to gain their maximum adhesion. A thorough chemical cleaning of the minute pores of the metal is achieved, along with the removal of all surface contamination, scale, and rust.

Employee Profit Sharing

IN ACCORDANCE with company policy, the Quaker Chemical Products Corp., Conshohocken, Penna., distributed a portion of 1941 earnings to each office, factory, and laboratory employee in the form of a bonus based on present salary,

EMPLOYMENT CLEARING HOUSE

MEMPHIS, TENNESSEE

APRIL 19–24, 1942

▼ ▼ ▼ ▼

ST. LOUIS, April 1941 — 1200 interviews

ATLANTIC CITY, September 1941 — 1000 interviews

MEMPHIS, April 1942 — ?

A service maintained for and limited to members and paid student affiliates of the American Chemical Society.

Since personal conference between employer and prospective employee is its main objective, the Clearing House will be open only to those registered at the Memphis meeting.

Advance registrations now being accepted.

For forms write to

American Chemical Society
1155—16th Street, N. W.
Washington, D. C.

See CHEMICAL AND ENGINEERING NEWS January 10, page 36.

RATES to be paid in advance. Standard setting 5c a word, minimum charge $2.00 each; include 8 words for box address. Exceptions see ⟶ Display, $7.50 per column inch. No discounts or allowances.

SEND advertisements with remittance to INDUSTRIAL AND ENGINEERING CHEMISTRY, 332 West 42nd St., New York, N. Y., to reach there not later than 10:00 A.M. on the 10th and 25th, closing dates for NEWS EDITIONS of the 25th and 10th, respectively. Insertions made in order of receipt provided necessary remittances are complete.

Employers are requested to mention in their announcements the section of the country in which the open position is located to ensure replies only from those who are geographically available.

In printing these advertisements the SOCIETY assumes no obligations as to qualifications of prospective employees or responsibility of employers.

Unemployed members of the AMERICAN CHEMICAL SOCIETY seeking employment for themselves are allowed in one calendar year 3 free announcements, one per issue, set in standard style and limited to 50 words each, including 8-word box address. Excess words 5c each. Additional standard announcements 50% of regular rate.

Employed members of the AMERICAN CHEMICAL SOCIETY seeking new positions are permitted 3 standard announcements during the calendar year at 50% of the regular rate—include 8 words for box address.

Employers seeking chemists and chemical engineers are permitted 3 standard announcements, not to exceed 50 words each including box address and not more than one per issue, during the calendar year without charge, provided they agree in writing to acknowledge all replies (excess words 5c each), otherwise full rate applies.

The AMERICAN CHEMICAL SOCIETY is vitally interested in the welfare of its members and in seeing that the chemical industry is manned with competent chemists and chemical engineers. These pages are part of our service in that connection. In addition most of the larger sections of the AMERICAN CHEMICAL SOCIETY and several of the smaller ones have active employment committees. Local section secretaries in your area will inform you as to any employment aids that may be available locally.

An Employment Clearinghouse is operated at each national meeting of the SOCIETY for the purpose of bringing together representatives of industry looking for chemists and members and student affiliates in attendance wishing to make such contacts. For further details, consult the preliminary and final programs as printed in the NEWS EDITION prior to each meeting.

In the New York area, special employment facilities are offered by the Employment Bureau of the Chemists' Club, 52 East 41st St., New York, N. Y. In the Chicago area, the Chicago Section maintains an employment service at 413 Stevens Hotel, Chicago, Ill.

Those replying to announcements should be careful to send copies and not original documents. Advertising circulars will not be forwarded and to that end all letters will be opened at the forwarding office.

SITUATIONS OPEN

Those announcements in which the letter "P" is part of the address key have paid in full and are not committed to acknowledge replies. The Society regards acknowledgment by employers of all applications as an act of common courtesy but can assume no responsibility for their failure to do so.

WANTED BY large Eastern concern for immediate employment; Chemists or chemical engineers for research and development work in petroleum and polymer chemistry. Our own employees have been advised of this advertisement. Replies will be treated in strictest confidence. Submit photograph with details of experience and qualification
Box 22-N-1, Ind. & Eng. Chem., Easton, Pa

RESEARCH CHEMIST wanted with actual working knowledge of formulation and production of synthetic resins, particularly of the phenolic type, to develop new thermo-setting resins from certain natural raw materials.
Box 28-T-1, Ind. & Eng. Chem., Easton, Pa.

GOOD OPPORTUNITY for Chemist experienced in production or research on manufacture X-ray intensifying screens. Give complete details including education, personal history, experience, salary desired, references. Include small recent photograph. Location New York City.
Box 35-T-1, Ind. & Eng. Chem., Easton, Pa.

GRADUATE ASSISTANTSHIPS at the University of Maine. Applicants may work half time toward the master's degree in chemistry or chemical engineering. Remuneration $500 plus tuition for twelve hours' laboratory instruction per week for the school year. Applicants should be in the upper quarter of graduating class. All applications must be received before March 15 and should include complete personal data, photograph, official transcript, preferred research field and three reference letters.
Box 11-N-2, Ind. & Eng. Chem., Easton, Pa.

ANALYTICAL CHEMIST. With advanced degree and 3 years' experience in biochemical field. Experience with tobacco analysis highly desirable but not essential. Give personal data, qualifications, salary expected and enclose photograph in first letter.
Box 30-N-2, Ind. & Eng. Chem., Easton, Pa.

PLASTICS CHEMIST for development work on by-products. Must be free to travel for prolonged periods. Send full data regarding education, experience, salary desired and small photo.
Box 67-NP-2, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER for sales promotion of industrial instrumentation in process industries. Sound technical training and several years process experience essential. Send photo and complete record with first letter. The Foxboro Company, Foxboro, Mass.

RESEARCH CHEMIST with broad training in the food industry. Good foundation in physical and organic chemistry necessary. Applicants should give educational history, scholastic grades, experience, age and other personal data, and recent photo. Excellent opportunity for qualified person.
Box 10-TP-2, Ind. & Eng. Chem., Easton, Pa.

CHEMIST with experience producing synthetic rubber. Good opportunity for capable man. Give past experience and former employment. Address: Bradley Murray, P. O. Box 1889, Tulsa, Okla.

ORGANIC CHEMIST of Bachelor or Master grades. Applicants should give educational history, experience, age, and recent photo. Opportunity for qualified person in research laboratory of prominent food organization.
Box 14-TP-2, Ind. & Eng. Chem., Easton, Pa.

WANTED IMMEDIATELY, Chemical Engineer or Mechanical Engineer with working knowledge of inorganic chemistry, as assistant in directing operations. Experience in leaching, evaporation, and electrodeposition desirable but not essential. Location near Pittsburgh, Pa. Send full particulars and photograph with first letter.
Box 17-T-2, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEERS and Chemists. Recent graduate, for laboratory and plant research work, mostly inorganic. Location near Chicago. Thorough knowledge of chemical fundamentals essential. Give full personal and scholastic details. Application must include photograph.
Box 20-T-2, Ind. & Eng. Chem., Easton, Pa.

ORGANIC RESEARCH Chemist, Bachelor or Master. Experienced in coal tar products. Location, Wisconsin. In first letter of application state age, experience, education, salary expected, citizenship, marital status.
Box 21-TP-2, Ind. & Eng. Chem., Easton, Pa.

PHYSICAL CHEMIST of Master or Ph.D. grade. Applicants should give educational history, experience, age, and recent photo. Opportunity for qualified person in research laboratory of prominent food organization.
Box 22-TP-2, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEERS. Large chemical company in the East has positions available for several outstanding chemical engineers, experienced or recent college graduates, who are technically proficient for engineering and process development work. Must have B.S. or M.S. degree from good technical college. The work involves studies and investigations of processing, raw materials, plant equipment, plant layout and cost reduction. Good opportunities for capable engineers. State age, college, year graduated, degree, by whom employed, present salary and salary expected. Will keep confidential. Enclose small photograph.
Box 23-TP-2, Ind. & Eng. Chem., Easton, Pa.

BACTERIOLOGIST, M.S. or Ph.D., with 3-5 years' applied experience in the field of sanitation and disinfection wanted by prominent eastern manufacturer for research and development work. Creative ability must be established. Consideration will be given only to those who fully meet the above requirements. In replying give full academic industrial and personal background. Transcript of academic record, scientific and personal references, and recent photograph will be requested.
Box 25-TP-2, Ind. & Eng. Chem., Easton, Pa.

CEREAL CHEMIST. Preferably with two or three years' experience. Applicants should give educational history, scholastic grades, experience, age, and recent photo. Excellent opportunity for qualified person in research laboratory of prominent food organization.
Box 26-TP-2, Ind. & Eng. Chem., Easton, Pa.

WANTED: OUTSTANDING Chemical and Metallurgical research engineer for large California aircraft company. High caliber man with a master's or doctor's degree, 5 to 10 years in teaching and industrial experience required in developing and analysing materials, chemicals, and processes. Salary dependent upon qualifications. Submit details of education, experience, personal data, salary requirements, and photograph.
Box 28-TP-2, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER to supervise construction and operation of equipment handling sulphuric acid. Give full particulars regarding education, experience, and salary desired.
Box 30-TP-2, Ind. & Eng. Chem., Easton, Pa.

ANALYTICAL CHEMIST for a food research laboratory. Sound training in the fundamentals of chemistry required. Details of educational history and experience, age, and other personal data, and recent photo should be submitted.
Box 31-TP-2, Ind. & Eng. Chem., Easton, Pa.

DIRECTOR OF RESEARCH—MAN OF WIDE EXPERIENCE

High attainments and outstanding accomplishments in organic chemical and related fields for large and successful company undertaking program of expansion in research work setting up new department. Unusual salary to the right man.

Box 32-TP-2, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER. Applicants should give educational history, scholastic grades, experience, age, and other personal data, and recent photo. Excellent opportunity for qualified person in research laboratory of prominent food organization.
Box 33-TP-2, Ind. & Eng. Chem., Easton, Pa.

ORGANIC RESEARCH chemist with recent extensive experience in the field of pigments, dyestuffs or intermediates for research work with large, expanding Eastern chemical company. Please give full particulars, including detailed history.
Box 39-TP-2, Ind. & Eng. Chem., Easton, Pa.

RESEARCH CHEMIST active in pharmaceutical or biological research, with considerable recent experience, for permanent position with progressive chemical firm. Compensation commensurate with qualifications. Give full particulars.
Box 40-TP-2, Ind. & Eng. Chem., Easton, Pa

A LARGE NATIONALLY known manufacturer with a large research organization needs a number of technical men. Among those needed is one with industrial or research experience in Asphalt Flooring or Paving Materials. Another needed should be a mature research chemist for development work and industrial sales problems on non-metallic building material products. Applicants should possess a good personality to be able to handle field contacts when required. Another is wanted for development and sales assistance on pressed wood products. Experience in coatings, finishes, and panel manufacture desirable. Another is wanted for research in asphalt, roofing research and manufacture. This man must be a B.S. or better in Chemistry or Chemical Engineering. In all cases give full details; education, experience, salary desired. Location Chicago.
Box 54-TP-2, Ind. & Eng. Chem., Easton, Pa.

A LARGE NATIONALLY known manufacturer with a large research organization needs an organic chemist for research work in the wood products research section. Applicants should be specialized in wood chemistry. Some industrial experience in this line is desirable but not essential if academic training is adequate. Applicants should be aggressive and have sufficient ability to be able to eventually carry considerable responsibility in fiber and hardboard research work. Give full details of education, experience, age, salary expected.
Box 55-TP-2, Ind. & Eng. Chem., Easton, Pa.

AN EXCELLENT OPPORTUNITY for a young pharmaceutical Chemist to direct the manufacture of Ampoule preparations in a well established New York Pharmaceutical Firm. He must have a thorough knowledge of the preparation, analysis, filtration, sterilisation, and sterility testing of Ampoule solutions. Applications stating age, experience, and salary requested.
Box 56-TP-2, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER with at least five years' commercial experience to work in plastic field, principally in production but also in design of equipment for plastic operations. Plant located in the Midwest. Sound training and experience required. State qualifications, salary expected and recent photograph.
Box 59-TP-2, Ind. & Eng. Chem., Easton, Pa.

(Continued on page 310)

Address communications to the box number indicated and Mail to Easton, Penna.

The American Chemical Society has no information concerning the position advertised—or in regard to those seeking employment.

(Situations Open Continued)

METALLURGICAL CHEMIST College graduate between 27 and 35 years of age having at least three years' industrial experience in metallography and analytical chemistry wanted for research work in a progressive organization in Chicago area. Candidate must be fast and accurate particularly in metal analyses and must have ability for research work and report writing and must be able to assume responsibility for carrying an outlined research program to completion. Excellent opportunity for advancement. Give full details of experience, education, personal data, salary requirement, and enclose a snapshot. Must be United States citizen. Reply.
Box 57-TP-2, Ind. & Eng. Chem., Easton, Pa.

WANTED
SALES AND SERVICE ENGINEER

A large well established Chemical Engineering and Consulting Organization supplying water conditioning service and chemicals essential to industrial plants, has a few vacancies in its sales and service staff. Qualifications should include knowledge of chemistry, engineering principles and the ability to meet and talk with people. Compensation on a basis of salary, bonus and expenses, with excellent opportunity for advancement. Our entire staff has knowledge of this advertisement.

Box 60-TP-2, Ind. & Eng. Chem., Easton, Pa.

CHEMIST or CHEMICAL Engineer. Well grounded in organic and physical chemistry for industrial Research relating to the process industries. Experience not absolutely essential. Initiative required. Give personal data, education, reference, expected salary, and recent photo.
Box 63-TP-2, Ind. & Eng. Chem., Easton, Pa.

RESEARCH FELLOWSHIPS in Wood chemistry available September 1942 for M.S. candidate. Full time research and study. Stipend $50 per month for nine months. Bachelor degree in chemistry or chemical engineering required. Address applications to Dean D. S. Jeffers, University of Idaho, Moscow, Idaho

ANALYTICAL CHEMIST. 3 to 5 years' experience in analytical chemistry. Able to develop analytical methods for newly synthesized compounds, mostly organic. Must be familiar with micro-analytical methods. Control on manufactured products. Give full information. State if draft deferred. Plant located near New York City.
Box 93-TP-2, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER for sales development work with products and processes recently developed by an established organization that is pre-eminent in its own field and is seeking to establish new markets for related products and processes. Applicant must be thoroughly trained in fundamentals of chemistry and engineering, able to express himself clearly, and shall have had at least 5 to 10 years' experience in similar pioneer sales development work. Apply by letter stating qualifications briefly and requesting detailed application blank.
Box 96-T-2, Ind. & Eng. Chem., Easton, Pa.

CHEMIST or CHEMICAL Engineer with research and development experience in automotive grease and lubricants, location metropolitan district New York. Applicant should give educational history, experience, record of previous employment, age and draft status.
Box 97-TP-2, Ind. & Eng. Chem., Easton, Pa.

THREE ORGANIC Chemists M.A. degree 1941 or 1942 preferred wanted for organic research developing new uses and products for organic chemical manufacturer. Submit full details concerning education, scholarship, experience, personal data, references, draft status, and recent photo. State salary desired. Address Post Office Box 460, Niagara Falls, N. Y.

RESEARCH CHEMIST with considerable experience in the chemistry of lignin, capable of supervising and conducting theoretical and practical work on various types of lignin. Salary open, dependent on experience.
Box 99-T-2, Ind. & Eng. Chem., Easton, Pa.

PHYSICAL CHEMIST. Eastern A. C. S. approved college with modern well equipped laboratory and library needs instructor for next academic year. Candidate should be less than 28 years old, preferably single, with a Ph.D. from leading university. Instructor will have light teaching load, and plenty of opportunity for research.
Box 103-T-2, Ind. & Eng. Chem., Easton, Pa.

TEACHING FELLOWSHIPS in chemistry, State College of Washington; master's and doctor's programs in organic, inorganic, analytical, physical, and physiological chemistry. One-half time assisting, stipend $450, plus out-of-state tuition.
Box 104-T-2, Ind. & Eng. Chem., Easton, Pa.

ORGANIC RESEARCH Chemist and Assistant Chemists for research and development work. Excellent opportunity for the right parties. Industrial experience welcome but not necessary. Give complete details including education, personal history, citizenship, draft status, experience, salary desired, send recent photo. Location, North Jersey.
Box 105-TP-2, Ind. & Eng. Chem., Easton, Pa

CHEMIST or CHEMICAL Engineer wanted for production work in field of thermo-plastic wire coverings. Excellent opportunity. New England location. Advise all particulars in first letter and enclose recent photograph.
Box 106-TP-2, Ind. & Eng. Chem., Easton, Pa.

OPENINGS in WASHINGTON, D. C., for chemists or chemical engineers, preferably with industrial experience and with specialized knowledge in either organic chemicals, heavy chemicals, drugs and insecticides, or petroleum. Some knowledge of economics essential. Salaries $2600-$4600.
Box 112-T-2, Ind. & Eng. Chem., Easton, Pa.

SITUATIONS WANTED
(A.C.S. MEMBERS)

SPECIAL LIBRARIES ASSOCIATION will recommend trained chemical and technical men and women librarians at no cost to employer or member. Competent persons are now available. Write to the Executive Office, 31 East Tenth Street, New York, New York, for additional information.

PHYSICAL CHEMIST, Ph.D., 1937. Nine years college teaching, general, analytical, physical. Research in electro organic and catalysis Expert glassblower. Polarograph. Sigma Xi. Age 30, married. Research or teaching position desired in East.
Box 49-T-10, Ind. & Eng. Chem., Easton, Pa.

WANTED: Opportunity for chemical career. A.B. chemistry major, now working for M.A. Experience limited to one year in inorganic analytical field. Now employed in bacteriological laboratory. Prefer N.Y.C. or vicinity. Age 33.
Box 15-T-12, Ind. & Eng. Chem., Easton, Pa.

COLLEGE TEACHING or research, Ph.D., 1940. Organic major. Two years' college teaching, general, organic, analytical; two years' graduate assistant. Phi Beta Kappa, Sigma Xi, fellowships, publications. Available June, 1942. Woman, single.
Box 21-T-1, Ind. & Eng. Chem., Easton, Pa.

ORGANIC BIOCHEMIST, Ph.D., 1942. Available March 1. Experience in vitamin D and sterol research, including spectrophotometric and chromatographic technique. Interested in vitamin, enzyme, or drug research. East preferred. Age 26, single, draft deferred. Protestant Member of Phi Lambda Upsilon, Sigma Xi Publication.
Box 24-T-1, Ind. & Eng. Chem., Easton, Pa.

SYNTHETIC ORGANIC Chemist. M.S. leading university. Additional graduate research. Young, responsible, good personality. Draft deferred. Excellent organic training. Industrial experience. Desires organic research position in a metropolitan area. Presently employed.
Box 12-N-2, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER, D. Eng., 13 years' experience in plant research, development and control including construction, installation, maintenance, operation in the oil refining industry, age 38, married. Desires new connection where his abilities can be utilized fully.
Box 49-N-2, Ind. & Eng. Chem., Easton, Pa.

SPECTROGRAPHER CHEMIST, M.S. accredited college. Two years' industrial experience in spectrographic, radiographic, and X-ray diffraction analysis. Desires research analytical position employing these techniques. Preferably in East or Middle East. Married, 26.
Box 63-N-2, Ind. & Eng. Chem., Easton, Pa.

DEVELOPMENT and RESEARCH chemist, Ph.D., chemical engineer, 14 years' successful direction in fermentations, cereal chemistry, biochemistry, yeast, foods. Careful worker, adaptable, invention minded, publications, patents, office experience, four languages, excellent credentials. Interested in responsible position or good opportunity for advancement.
Box 65-N-2, Ind. & Eng. Chem., Easton, Pa.

PRODUCTION CHEMIST. Graduate chemical engineer with twenty years' experience in heavy chemicals, acids, purified cellulose fibre, nitrocellulose, viscose-cellulose film, paper coatings, lacquer formulation. Positions held: chief chemist, development engineer, production department head, plant superintendent. Primary interest: production supervision.
Box 74-N-2, Ind & Eng. Chem., Easton, Pa.

SYNTHETIC RESIN Chemist. Five years' experience in technical research on synthetic coatings and adhesives. Also experienced in photochemistry. I have shown originality; and I have obtained practical results. Married. Age, 28. Harvard training. Now employed, seeking better opportunity.
Box 68-N-2, Ind. & Eng. Chem., Easton, Pa.

POSITION TEACHING general or physical chemistry desired by Ph.D. from large midwestern university having one year post-doctoral research experience, three years' experience teaching general chemistry. Age 27, married, selective service classification 3A. Sigma Xi, Phi Kappa Phi, Phi Lambda Upsilon. Opportunity for research is essential. Available June 1942.
Box 78-N-2, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER, 13 years' experience in pigment manufacturing and wet metallurgical processes. Research and manufacture of lithopone, zinc pigments, titanium dioxide, barytes reduction, zinc liquor purification. Electrolytic manganese. Pilot plant operation. Available now.
Box 80-N-2, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, M.A., 1941 from A.C.S. accredited university. Employed as research chemist by large marine products company. Desires change to concern active in defense. Experienced in pilot plant design and operation.
Box 11-T-2, Ind. & Eng. Chem., Easton, Pa.

COLLEGE TEACHING Physical Chemist and Metallurgist, Ph.D., Midwestern college, 1933, nine years' of teaching and seven of industrial research experience desires to return to teaching. Position sought would offer opportunity to pursue fundamental research already well underway on thermodynamics and kinetics of surface reactions of metals and gases, and metals and liquids. Prefer to have opportunity to direct research where the publication of results is encouraged. Married, Protestant, 37, Phi Lambda Upsilon, Alpha Chi Sigma, Sigma Xi.
Box 16-T-2, Ind. & Eng. Chem., Easton, Pa.

PHYSICAL CHEMIST, Ph.D., 1942, desires industrial position. Research involves isotopes, mass spectrometer, low temperature, and high vacuum work, glass blowing. Thoroughly experienced in new physico-chemical techniques. Excellent training in organic chemistry. Publications in physical and organic chemistry. Age 25. Phi Beta Kappa, Sigma Xi, Phi Lambda Upsilon, honors. Available June.
Box 18-T-2, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, B.S., 1940, midwestern university. Versatile, aggressive, practical. Now employed but desires a position with better opportunity. Draft-exempt. Excellent educational background, good chemical engineering training. Petroleum, inorganic, organic, and plastics experience.
Box 19-T-2, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, Ph.D., 1941, from large midwestern university available for teaching or industrial research position. Experience in teaching of general, organic, and analytical chemistry. Research on analysis and synthetic resin coatings under industrial fellowship. Major, physical chemistry; minors, organic and mathematics. Honor Societies. Publication. Available immediately.
Box 27-T-2, Ind. & Eng. Chem., Easton, Pa.

WOMAN CHEMIST, Ph.D. March 1942. Major fields: physiological and organic. Good background in bacteriology. Experience as laboratory assistant in food analysis, bio-assays, toxicology, pharmacology. Research in fat synthesis and metabolism. Considerable work with laboratory animals. Desires research or teaching position.
Box 29-T-2, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMISTRY student, B.A. May 1942 Eastern university, age 21, advanced courses in instrumental quantitative, organic; scholastic prizes, honors, active and experienced in college publications, desires summer, possibly permanent position — research, development, or technical editorial. Eastern location, available May 20.
Box 34-T-2, Ind. & Eng. Chem., Easton, Pa.

PLASTICS or SYNTHETIC rubber position desired by chemist with about a year's research experience in plastics, some teaching experience and advanced training in Chemistry and Chemical Engineering. Now employed. Married. Honor societies.
Box 35-T-2, Ind. & Eng. Chem., Easton, Pa.

RESPONSIBLE TEACHING, research or development position desired by Chemical Engineer Ph.D. 1934. 6 years' industrial research, development and control experience (inorganic heavy chemicals). 6 years' teaching. Patents. Present research on waste gas recovery and industrial utilization of agricultural by-products. Age 35. Married.
Box 37-T-2, Ind. & Eng. Chem., Easton, Pa.

DRUG RESEARCH and development. Ph.D. organic chemistry, registered pharmacist, 15 years' experience conducting and directing pharmaceutical research and development with large ethical firms. Desires executive position. Experienced Food & Drug Rules, many publications and patents.
Box 41-T-2, Ind. & Eng. Chem., Easton, Pa.

(Continued on page 311)

(Situations Wanted Continued)

PH.D., 5 years' research in Sweden, biophysical effects of short waves and isotope separation, 2 years' research fluorine chemistry in America, many publications. Austrian, Christian, single, age 29, first citizenship papers obtained.
Box 42–T–2, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER, M.S., with Ph.D. in agricultural biochemistry. Graduate training includes work in chemical engineering, organic chemistry, biochemistry, and bacteriology. Five years' experience in food industry. Sigma Xi, Phi Lambda Upsilon. Desires position in the Middle or Far West.
Box 43–T–2, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST Ph.D. 1939, 3½ years' industrial experience in research including the development and production of organic chemicals. Employed at present. Desires position with opportunity for advancement. Married, 3A deferred.
Box 46–T–2, Ind. & Eng. Chem., Easton, Pa.

SYNTHETIC ORGANIC Chemist, Ph.D., 38, single. Seven years' experience in dyes and intermediates, insecticides, plasticizers, special fruit and petroleum products. Available on short notice. Phi Beta Kappa, Sigma Xi. Moderate salary requirements.
Box 47–T–2, Ind. & Eng. Chem., Easton, Pa.

COLLEGE or UNIVERSITY Professorship. Ph.D. from leading university, experienced teacher general and organic chemistry. Research, publications, administrative and industrial experience. Interested also in high-type course for non-chemistry majors. Married.
Box 49–T–2, Ind. & Eng. Chem., Easton, Pa.

RESEARCH, DEVELOPMENT, in vital industry. M.S. in Applied Science, June 1942. B.S. in Chemical Engineering 1940. Research in thermosetting resins, applications to surface coatings. Graduate emphasis on organic. Advanced mathematical training. East preferred.
Box 50–T–2, Ind. & Eng. Chem., Easton, Pa.

INORGANIC CHEMIST Ph.D. Executive. Eight years' experience supervising research in the dry color industry. Expert in systematic development of new processes. Responsible for many outstanding developments. Publications, patents. Employed but desire to enter new field.
Box 52–T–2, Ind. & Eng. Chem., Easton, Pa.

PLANT MANAGER or Superintendent. Chemical Engineer. Plastics, solvents, synthetics, extracts, heavy chemicals, Plant operation, maintenance, inventory and cost control and reduction, organise, personnel (union) relations. Accustomed full responsibility. Native, married, Protestant, forty. Patents, publications, references. Available reasonable notice and salary.
Box 53–T–2, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, Ph.D., desires laboratory position in large or small essential industry. Excellent mastery of organic; also experience in analytical and biological chemistry, organic metal compounds, foods, bacteriology and college teaching. Now employed in Midwest. American; Protestant; age 36; draft 1-B.
Box 58–T 2, Ind. & Eng. Chem., Easton, Pa.

CHEMIST: will complete work for Ph.D. 1942. Major inorganic and analytical. Good training in organic. Desire position doing research. Preferably New York City or vicinity. 18 years' practical experience. Publications. Available immediately.
Box 61–T–2, Ind. & Eng. Chem., Easton, Pa.

RESEARCH and INDUSTRIAL Chemist. Eng. Ph.D. Excellent scholastic standing. 13 years' successful research in electrochemistry, microchemistry, catalysis, food. Broad background, experience in physic, electronic, X-ray, spectrographic. Literature surveys. Publications. Patents. Desires research, leading position. Married 35. Prefer N. Y.
Box 62–T–2, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, Ph.D. 1928, minor physics, 13 years' experience synthesis, aliphatic, aromatic, heterocyclic compounds, also enzymes, vitamins, coal tar products and plasticizers; familiar with physico-chemical methods. Want responsible position in organic research, preferably with biochemical applications. North or South America.
Box 65–T–2, Ind. & Eng. Chem., Easton, Pa.

WOMAN CHEMIST, Pharmacist, Bacteriologist. Ph.D. in Chemistry, citizen United States, seeks position. Will accept librarian position with industrial research laboratories. Speak, write, translate English, French, German. Location immaterial.
Box 68–T–2, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, Ph.D., 1942 from Eastern University. Thorough training in Organic and Physical Chemistry and Bacteriology. Research experience in organic synthesis, nitrogen heterocycles, medicinals, endocrinology. Desires position as research organic chemist with progressive industrial firm. Available in early Spring. Eastern location preferred.
Box 69–T–2, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, M.A. 1941. Training and research specialised in organic analysis and physicochemical analytical methods. Publications. Read German, French. Background biochemistry, colloids. Age 24. Draft deferred. Employed. Desire research or development position. West preferred but any location acceptable.
Box 73–T–2, Ind. & Eng. Chem., Easton, Pa.

PHARMACEUTICAL CHEMIST, Ph.D. 1942. Gentile, married, draft deferred, Sigma Xi and Rho Chi. Desires location with pharmaceutical manufacturer or teaching.
Box 74–T–2, Ind. & Eng. Chem., Easton, Pa.

CHEMIST and PHYSICIST, extensive practical and laboratory experience, ballistics, ordnance engineering problems, military explosives, analysis of data. Excellent university training, undergraduate chemical engineering, postgraduate chemistry and physics, Tau Beta Pi, Sigma Xi, scholarship honors. Prefers permanent position with progressive organisation. Employed, married, 32.
Box 76–T–2, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, Ph.D. 1934. Thoroughly grounded, over five years' experience in the organic field (fats, soaps, resin, other aliphatics). Anxious to enter the Petroleum or plastics field. Location immaterial.
Box 87–T–2, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, Ph.D., desires change to responsible position in industrial research or development work. More than six years' experience with aliphatic reactions and chemicals and their industrial application, including surface-active agents, coating compositions. Languages. Location immaterial.
Box 88–T–2, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, research and development. B.S., Chemical Engineering; M.S., Chemistry and over six years' varied experience in synthetic organic chemistry. Now employed but desires more responsible position in a metropolitan area, preferably in New York or Chicago.
Box 89–T–2, Ind. & Eng. Chem., Easton, Pa.

SYNTHETIC POLYMER chemist. Thorough industrial research and development experience in Thermosetting, Thermoplastic and ore soluble fields. M.S. in organic and physical chemistry, Tau Beta Pi. Desires responsible position in above or related fields.
Box 91–T–2, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, Organic Ph.D. Teaching or research. Twenty years' College Professor. Agricultural Experiment Station Research Experience. Protestant. Married. Location immaterial. Now employed, but desire change. July 1, 1942.
Box 90–T–2, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, B.A., sixteen years' experience in research, production, and control especially in foods, bacteriology, and biochemistry. A good plant manager and superintendent; successful research and sales experience. Can get things done and usually make money for employers. Age 39, married, Protestant.
Box 92–T–2, Ind. & Eng. Chem., Easton, Pa.

PHYSICAL CHEMIST, PH.D.

with long and thorough experience in the field of synthetic and natural fibers, viscosity of high polymers, microtechniques. Fourteen years' of research and development work. Numerous publications and patents. Foreign languages. At present engaged in independent industrial research and consulting work. Available on short notice.

Box 95–T–2, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER, B.Ch.E., 1940, Tau Beta Pi. Single, 23, 3A draft. Two years' experience development synthetic resins and plastics, mainly laminated phenolics. Desire any position in plastics industry. Metropolitan area preferred, but will consider anywhere. Available immediately.
Box 100–T–2, Ind. & Eng. Chem., Easton, Pa.

EXPLOSIVES CHEMIST. 1½ years' dynamite plant; analysis, testing of powder, mixed acid and nitroglycerin. Explosives laboratory; some plant operation. Graduate ESMDT course powder and explosives. Desire explosives development or inspection. Cal. Tech. Publication. Inorganic analysis. 2-B deferred. 23, single. Anywhere.
Box 101–T–2, Ind. & Eng. Chem., Easton, Pa.

ORGANIC BIOCHEMIST, Ph.D., 1942. Available immediately. Research experience in organic syntheses and enzyme chemistry. Interested in organic, biochemical or drug research. Age 24, single, draft deferred. East preferred. Member Phi Beta Kappa, Phi Lambda Upsilon, Sigma Xi.
Box 102–T–2, Ind. & Eng. Chem., Easton, Pa.

PHYSIOLOGICAL CHEMIST Ph.D., 31, with 8 years' experience in theoretical and practical research including nutrition and some teaching. Education soundly based on organic, physical and analytical chemistry. Desires position in which creative ability, independent thinking and knowledge of the biochemical methods will be of service.
Box 107–T–2, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, PH.D., 1939, inorganic chemistry M.S., 1925, chemical engineering. Eighteen years' teaching experience includes inorganic, industrial, physical. Publications. Honor societies. Employed but desires greater opportunities.
Box 109–T–2, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER, B.S. Specialising in acetylation of cellulose and carbohydrates, and adaptation of these to plastics and hot melt paper coatings. Experience in alkyd resins, and design and operation of pressure equipment. American, married, Protestant, age 39. Available immediately.
Box 110–T–2, Ind. & Eng. Chem., Easton, Pa.

RUBBER CHEMIST Graduate chemical engineer, with 8 years' experience in rubber, synthetic resins, and organic chemical research and development. Laboratory and plant supervision, plant design, consulting work and promotion of new products. Patents. Now employed, but desires position for development of available raw material.
Box 111–T–2, Ind. & Eng. Chem., Easton, Pa.

INDUSTRIAL CHEMIST, educated abroad, Dr. Ch.E., citizen. 25 years' responsible positions in U. S. A. with leading firms: edible and technical oils, fatty acids, distillation, extraction, hydrogenation; manufacturing of intermediates and dyestuffs; textile industry, scouring, fiber lubrication, dyeing (skein and raw stock). Laboratory, pilot and commercial plant; creative ability. Seeking connection, preferably production department where better results (quantity, quality, yield) are wanted. Married, Christian, excellent health; unaffected by draft. Go anywhere.
Box 113–T–2, Ind. & Eng. Chem., Easton, Pa.

SITUATIONS WANTED
(NONMEMBERS)

CHEMIST and BACTERIOLOGIST, female, Bachelor's degree in Chemistry, Jan. 1942 Excellent background in organic biochemistry. Two years' analytical research experience. Knowledge of German, typing. American, 21. Location immaterial.
Box 48–T–2, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST A.B., M.S. 1934. Recent work toward Ph.D. Midwestern university. Age 33, married. Ten years' teaching small college. Well qualified, but no extravagant claims. Publications, languages—some Spanish. Employed. For your protection am Negro.
Box 51 T–2, Ind. & Eng. Chem., Easton, Pa.

RESEARCH CHEMIST, married, age 31. Bacteriological and immunological background. Six years' research with proteins, nucleoproteins, carbohydrates and nucleic acids. Extensive analytical experience. Now engaged in research in large Eastern University Medical School. Desires position where competence and originality are recognised. Several publications. Excellent references.
Box 75–T–2, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, Ph.D., many years' experience in vegetable oils. (Refinery, hydrogenation, fatty distillation, etc.) Wants position in production or research with chance for advancement.
Box 79–T–2, Ind. & Eng. Chem., Easton, Pa.

BACTERIOLOGIST and FERMENTATION Chemist, M.S. 1939. Two and one-half years' industrial research experience. Desire change of employment, prefer eastern location.
Box 82–T–2, Ind. & Eng. Chem., Easton, Pa.

CHEMIST B.S. 1930, with excellent background in biochemistry, physical and analytical chemistry. Research on enzymes, surface tension; development of analytical methods. Publications. Age 33, married. Desires industrial position, location immaterial.
Box 94–T–2, Ind. & Eng. Chem., Easton, Pa.

GRADUATE WOMAN Chemist, age 32, excellent knowledge German, French, some Spanish; also medical and engineering phraseology. Experienced research and executive office routine. Writing ability. Wants position combining research and office, or research and laboratory, or reporting for trade paper. No straight abstracting or stenography wanted.
Box 108–T–2, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER: Highly successful record in development and production work in organic chemicals. Experienced in handling personnel. Would like responsible position in development or production work. Location immaterial. Christian. Age 29. Now employed in East.
Box 114–T–2, Ind. & Eng. Chem., Easton, Pa.

MISCELLANEOUS

BUSINESS OPPORTUNITIES • FOR SALE • WANTED • ETC.

Five cents a word, minimum charge $2.00; display available at $7.50 per inch; in advance. No discounts or allowances

MICRO-ELEMENTARY ANALYSES: C, H, N, S, P, Halogens, Methoxyl, Mol. wt., etc., U.S.P. and other official tests, Purity tests, Microinorganic assays, Spot tests, Micro-distillations, Toxicological investigations, and typical micro-chemical research work. Dr. Carl Tiedcke, 366 Fifth Avenue, New York, N. Y.

ASKING for INQUIRIES for manufacturing of fine organic chemicals in limited quantities. Box 85-N-2, Ind. & Eng. Chem., Easton, Pa.

WANTED to BUY: a three to ten pound supply of asbestos for Gooch Crucibles. Box 36-N-2, Ind. and Eng. Chem., Easton, Pa.

WANTED to BUY: manufacturing process for Diphenylamine. Offers: Box 70-N-2, Ind. & Eng. Chem., Easton, Pa.

WANTED: "American Ceramic Society, Journal (with Bulletin)": 1918, 1919, 1921-1928: 1930, 1931, 1933-1941, paying $4-per year, "Journal of Physical Chemistry": vol. #2 (1898) #4, 7; Vol. 6 (1902) #4; Vol. 10 (1906) #10, paying $5-per number. Dr. G. H. Fransius, 201 East 82nd Street, New York, N. Y.

WANTED to BUY: Complete set Beilstein's Handbuch der Organischen Chemie, 4th edition. Will consider incomplete set if details of contents of main volumes and supplements are submitted. State condition and price. Box 36-T-2, Ind. & Eng. Chem., Easton, Pa.

WANTED BOOKS: Bode and Altpeter's "Das Pyridin und seine Derivativ," Hickinbottom's "Reactions of Organic Compounds," Hollin's "Synthesis of Nitrogen Ring Compounds," Hans Meyer's "Analyse und Konstitutions ermittlung organischer Verbindungen," Barnett's "Anthracene and Anthraquinone," Te-Pang Hou's "Manufacture of Soda," Everest's "Higher Coal Tar Hydrocarbons," and Hewitt's "Synthetic Coloring Matters Derived from Pyridine, Quinoline, Acridine and Xanthene. Box 38-T-2, Ind. & Eng. Chem., Easton, Pa.

WANTED: 1 to 5 lbs. acetoin (Acetylmethylarbinol) 1/4 to 1 lb. acetylpropionyl. Advise purity and price. Box 64-T-2, Ind. & Eng. Chem., Easton, Pa.

WANTED: Quotations on Bilstein "Handbuch der Organischen Chemie," 4th edition and 4th supplementary complete or in parts; Gmelin 8th edition; Berichte 49, Nos. 8-12; 61, No. 8; 64, No. 1. Box 67-T-2, Ind. & Eng. Chem., Easton, Pa.

WANTED: Beilstein's Handbuch der organischen chemie, Vols. 15, 17, 18, 19, 20, 21. Price $2.00. Box 72-T-2, Ind. & Eng. Chem., Easton, Pa.

WANTED: 1000 pounds Cerium Chloride Tech, 1000 pounds Maleic acid anhydride, 5000 pounds Sodium Glutamate, 25 pounds Boron Amorphous, 100 pounds Zirconium Metal Powder, 500 grams Tryptophane, 20 kilos Asparagine, 100 lbs. Xylose, Kilo Aesculin, 5 kilos Histidine HCL. Box 77-T-2, Ind. & Eng. Chem., Easton, Pa.

FOR SALE: Heavy duty horizontal hydraulic pump. 4 bronze cylinders, bronze pistons 1 1/2 inch diameter. Capacity 4- to 600 gallons hourly. Pressure 4000 lbs. Geared for motor drive. Little used. Located Baltimore. Box 15-T-2, Ind. & Eng. Chem., Easton, Pa.

FOR SALE: Old established commercial laboratory. Splendidly equipped. Centrally located in highly industrialised area. Rare opportunity for mass production metallurgical chemist. Can accommodate six chemists. Dissolving partnership. Box 24-T-2, Ind. & Eng. Chem., Easton, Pa.

FOR SALE: Complete set Chemical Abstracts, 1907-1942, with all three decennial indexes, complete, unbound. In Vol. 1 numbers 1, 2, 4, and 6-11 inclusive are original, the rest of Vol. 1 only being reprinted but hardly distinguishable from the rest. Perfect condition. $700. Box 44-T-2, Ind. & Eng. Chem., Easton, Pa.

FOR SALE: Journal American Chemical Society, 1907-1942, complete, unbound, in perfect condition. 36 volumes. $300. Box 45-T-2, Ind. & Eng. Chem., Easton, Pa.

FOR SALE: 1 Type K L & N Potentiometer equipped with 1 No. 2109 Lamp & Scale, 1 Type R Galvanometer, 1 No. 8240 10 point Rotary Switch, 1 .01 Ohm Standard Resistance. These items also sold separately. Also 1 International Electric No. 3021 Size No. 1 Type SB Centrifuge. Box 66-T-2, Ind. & Eng. Chem., Easton, Pa.

FOR SALE: Trans. Faraday Society, V. 22, 23, 32-35. Journal Soc. Chemical Industry, 1882-1933. Journal Chemical Soc. London, 1900-39. Electrochemische Zeitschrift, V. 1-13 (1894-1907). hf. cf. General Index "Berichte," 1888-1896. hf. cf. Chemical Abstracts 1930-33 and 35 Annual Reports Chemical Society—London, various volumes. Box 70-T-2, Ind. & Eng. Chem., Easton, Pa.

FOR SALE: Truck, warehouse, hopper and tank scales. All sizes and capacities. Vibrating screens and crushers. New and used. Immediate delivery. Priced low. Many of America's nationally known firms are our customers. Write for literature and prices. Bonded Scale Company, Manufacturers, Columbus, Ohio.

WE OFFER: All Caesium and Rubidium Salts, Gallium Germanium Indium metals and salts, Zirconium metal powder, Powdered Iron almost spectroscopically pure, Ferroboron, Ferrouranium, Cerium Chloride Tech. quantity, Mischmetal, Selenium Red, Beryllium metal and salts, Titanium metal and salts, Quinine Valerate. Box 78-T-2, Ind. & Eng. Chem., Easton, Pa.

FOR SALE: American Chemical Society publications: Journal 1895-1941; Abstracts, complete with all indices; Industrial and Engineering, complete. Proceedings National Academy, complete. Zeitschrift anorganische, Volumes 100-120 and 124-126. All in fine condition and most bound. Box 80-T-2, Ind. & Eng. Chem., Easton, Pa.

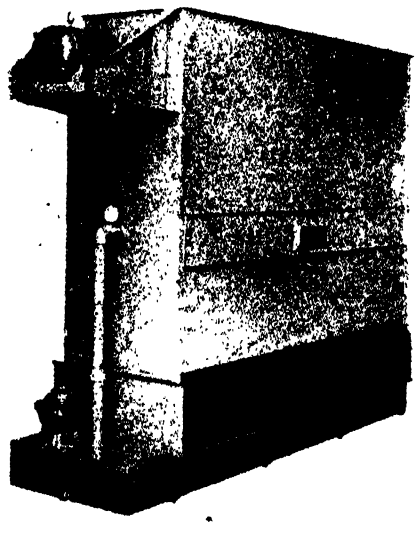
NEED BALANCES? We have just purchased 85 unused pulp balances in fine polished mahogany glass cases with cointerpoised sliding front door, equipped with leveling feet, drawer for weights, capacity 100 gr., sensitivity 1 mg., diameter of pans 85 mm., beam, column and bows are of lacquered brass, aluminum pans. These are fine general laboratory balances for small weightings, such as pulp, dispensing samples, prescriptions, sugar, gold, silver and others. Ready for immediate delivery, no priorities are needed. We suggest ordering promptly to assure deliveries. Most inexpensively priced at $27.50, value $40.00. Subject to complete guarantee and approval. Write or wire immediately, the Laboratory Exchange, 24 E. 21st Street, N. Y. C. Algonquin 4-3879.

LIQUIDATING the entire laboratory of the Estate of Dr. Frederick H. Getman removed by us to New York from Stamford, Conn., for disposal. A large selection of general physical laboratory instruments and equipment such as Hilger Spectrometer, Gaertner Spectrophotometer complete, Gaertner Cathetometer, Gaertner Measuring Microscope, Cenco Thermostatic Water Bath, Leeds & Northrup Instruments, Weston Meters, large General Electric Company Motor Generator 110 v. a.c. to 125 v. d.c., Cathodes, Hanovia Ultra Violet Lamps, Colorimeters, Glassware, Chemicals, Mercury, Standard Cells, Beckmann Thermometers and others. U. S. Bureau of Standards Certified, 2 Barometers, Fortin type, Mercurial U. S. Signal Corps. Type, Barnstead Stills, Microscopes, Electrodes, Fine analytical balances, Schmidt & Haensch Polarimeter, Edwards Gas Density Balance, etc. Write or visit us for complete selection. Send us lists of your needs promptly. The Laboratory Exchange, 24 E. 21st St., N. Y. C.

FOR SALE: Subject to Prior Sale. Fully guaranteed equipment. Subject to complete approval. International Centrifuges, very fine analytical balances (substantially as good as new). All makes are now available Becker, Troemner, Voland, Torsion Scales, Hydraulic presses, Barnstead Water Stills, Freas and other make drying ovens, horizontal sterilizing autoclaves, Colloid Mills, Vacuum Ovens, Microscopes, Colorimeters, Spectrophotometer, etc. Write us your needs for immediate attention. The Laboratory Exchange, 24 E. 21st St., N. Y. C. Algonquin 4-3879.

WANT TO BUY. We are buying everything in laboratory equipment, Instruments, Balances, Microscopes, Refractometers, Spectroscopes, Polarimeters, Lenses, Cameras, Glasses, etc. Turn your surplus or equipment you no longer need into bonds and help win the war. We are in need of equipment to meet the demand from war working industries, Universities, Chemists, Metallurgists. Time is of great importance. Look around and write us what you have to sell. Highest possible quotations will be cheerfully given, all purchases are cash. Write promptly and give description of equipment. The Laboratory Exchange, 24 E. 21st Street, N. Y. C.

Industrial News



CONTINUED FROM PAGE 307

years of service, and the value of the individual to the corporation. Some employees received the equivalent of three months' salary. This year's-end bonus payment is in addition to a similar bonus distributed in July 1941.

Evaporator

THE Niagara Blower Co., New York, N. Y., has announced the production of a new evaporative type unit for removing heat from industrial liquids, quenching baths, jacket water, oils, hydraulic fluids, oil lubricating systems, soap and other solutions, chemicals, and coolants.

The new unit consists of a casing containing tubes through which the hot liquid passes. A spray system drenches the tubes constantly with circulated water and air is drawn through the sprayed coils by a fan, applying the principle of evaporative cooling. Only the water evaporated is consumed, saving 95 per cent of the water ordinarily used with shell and tube heat exchangers.

In addition, provision is made for bypassing the air, controlled by thermostat operated dampers, maintaining a constant liquid temperature, for a heating coil in the liquid tank, for pre-heating solutions as required for controlled temperature quenching baths, preventing freezing in winter, and preventing the separation of high melting point fats from solution.

Installations have been made in wire drawing, heat treating departments, machinery lubricating systems, Diesel engine power plants, and chemical processes.

Optical Lens Tissues

THE Emil Greiner Co., 161 Sixth Ave., New York, N. Y., has become the exclusive distributor to the laboratory and chemical supply trade for Ross optical lens tissues. These are said to be superior to the Japanese types heretofore generally used.

War and Chemical Industry

W. S. LANDIS
American Cyanamid Co., 30 Rockefeller Plaza, New York, N. Y.

TWICE within the period of my active connection with the chemical industry, our country has been engaged in a major war. In each the conflict started on a distant front, and months of active campaign elapsed before America formally became a party to the struggle. In each America was called upon to supply munitions to one group of the contending nations before she herself became an active participant. The two events, separated by a quarter of a century, however, found a very different economic situation in the country at the time of our active participation.

At the outbreak of the first war, America was more highly industrialized than any other nation, but her industries were principally of the heavy type, such as metallurgical or conversion units, operating on native raw materials. Plants were large and reflected some standardization and mechanization. In the chemical industry we produced mostly heavy chemicals. Our fertilizer industry was significant, but our dyes, pharmaceuticals, and fine chemicals were largely imported. Thus, many of our basic industries were dependent on foreign sources of supply for these latter products.

When blockade shut off these imported materials, our whole textile industry, wool and cotton goods, suffered from lack of dyes, our fertilizer and soap industries from lack of potash, our health from shortage of important drugs and medicines. The total economic destructive effect was far greater than the intrinsic value of the chemicals themselves; in fact the latter was relatively insignificant as compared with the capital and consumers goods in the production of which these chemicals are used.

This dislocation of industry resulted in serious attention being devoted immediately after the close of the war to a domestic production of these critical materials, and within the decade of the 20's a respectable, fine chemical industry was developed on the meager skeleton of the small prewar units. It is unnecessary to go into detail as to the extent of this postwar development. We chemists are all well aware that we are entering the second war with a complete line of production, which had amply shown its ability to meet all peacetime requirements. In tonnages our fine chemicals exceeded that of any other nation; in quality they were the equal of any. The relatively new units and the large scale of consumption gave us a modern and highly efficient plant. Our schools supplied well-trained technicians. Our apparatus builders met all the exacting demands of our skilled engineers. We rapidly put this fine chemical industry on an undreamed of production schedule. And this present war found a wholly different chemical structure than the previous war, and one in which we are so much better equipped for peace and war needs.

Nevertheless, war exerts a most destructive effect on all organized industry. Industry fights against war. It does not want it. For war disrupts the orderly program of development, confuses our managements, robs us of our trained personnel, destroys our customer service. Through excessive taxation created by extraordinary expenditures, it limits our capital needed for natural growth and expansion and improvement, lowers the standard of living and morale of our employees, destroys the value of our securities. War exerts an enormous restraining influence upon industry's desire to serve mankind and better the human standards. And no industry wants war.

How many of you have ever thought this example through? Prior to the outbreak of World War I, Germany had a virtual monopoly of the fine chemicals. She was practically the sole producer of potash, so vital to industry and agriculture. When the Allied blockade stopped all exportation of these essentials, each affected nation proceeded to meet this emergency and any subsequent repetitions through development of home production. Germany lost these important foreign markets forever. Her economic balance had been established on the basis of monopolistic control with high returns from the dyes, pharmaceuticals, and heavy chemicals, which exports supplied the exchange for purchase of foreign raw materials and foods and sustained her industry. No previous preparation had been made for meeting such a catastrophe; in fact, defeat in the war was never contemplated. But such was the course of events. There could be but one ultimate answer—either she must regain this lost trade position or the nation must lose its pre-eminent position. The politicians would not reopen the problem to find a peaceable and permanent solution. Therefore a new war must come. The age-old principle, "You feed them or fight them", came into action. And now this new war is upon us.

The man of science should not be blamed for this catastrophe. His mission is to give the world an ever-rising standard of life. He should leave to the economist the adjustment of the delicate balances frequently upset by continuous scientific development. But the economist has failed and the politician was unequal to the task. War is again upon us.

This same situation is likely to be duplicated. The same fundamental program is again under way. The less highly developed countries and dominions and colonies all are building and expanding fundamental domestic industry. The chemical industry serves all. It is primarily a service industry, and secondary to the development of such fundamentals as agriculture, textiles, leather, paper, and the like. The dislocation of all industry, particularly the chemical, in any country active in a war interferes with the dependent infant industries in foreign lands. They, in turn, demand self-sufficiency as to secondary supplies and, just as America and England did following the last war, they

[1] Presented before the Western Connecticut Section of the AMERICAN CHEMICAL SOCIETY January 26, 1942.

may be expected to prepare themselves so that it does not happen again. We can therefore expect intensive development of a fundamental chemical industry in these distant lands, already awake to the importance of home production. China, India, South Africa, Australia, the several South American Republics, Mexico, all will see that their fundamental chemical requirements will be met by home production. Again we shall face an unbalancing of the previous status quo. The same problem will in the future again confront the economist—the establishment of a new balance. Let us hope war will not again be the politician's dictation as the only way out.

The industrial chemistry of peace and of war travel the same path only in part. While both are founded upon the same science and in general employ much of the same apparatus and types of process and chemical knowledge and experience, there are still some important differences. At the outbreak of the present war our chemical industry had only a reasonable amount of producing capacity for the manufacture of peacetime explosives. Private industry had no capacity for the production of military explosives. We were just coming out of a long and deep depression. At the depth of this depression some 10 years ago our industry was operating at probably not over 40 per cent of its rated capacity. By 1937 we had begun to approach capacity in some branches, but over all there was still a very considerable margin of unused plants. In 1939 the activity was lower than the peak reached in 1937. After the outbreak of war in Europe foreign customers began to come into our markets and early in 1940 we had overtaken some of the recent losses. By the middle of the year most of our chemical units were again at capacity. From 1936 on, the industry had undertaken within its own means a very considerable expansion program. The figures for 1941 are not yet available, but they do reach a very large sum. None of this, however, was devoted primarily to munitions production. However, certain of our former foreign customers began to establish units designed primarily for munitions production on this side of the Atlantic. By the close of 1940 not only were our own plants operating at capacity but certain of the munitions units established under foreign auspices were also producing.

As our country entered the war, industry still had very little knowledge of the demands that it might be called upon to meet. It is true that back in 1940 a few munitions plants of chemical classification were built in this country and in that of our neighbor to the north, Canada. In fact, they actually got into operation before the close of the year. It is also true that in the first half of 1940 our own procurement divisions began to concern themselves in a serious manner about the possible entry into the conflict and the necessity of more of these chemical munitions plants. But even this program was a very meager one, calling for relatively few units, relatively small production capacity, and some of them badly located with respect to efficient operation.

The chemical industry could not be expected to know the demands of our military and naval units. It had no knowledge of the programs and, in fact, possessed no facilities for the production of propellents or high explosives, gas or incendiaries. It had no knowledge of the types, varieties, or quantities involved or necessary in any chemical project. There is no use for such equipment in peacetime industry and, even though some of the apparatus may be interchangeable for daily routine operations, such a type of plant as the explosive plants, which produce a commodity circumscribed by hazard and require a distributed layout, would be extremely inefficient for competitive peacetime production of nonexplosives.

Another factor that must be considered was the position taken by our authorities that munitions plants must be located within certain prescribed areas of this country which, as it happens, offer very little market for chemicals of any sort, and therefore possess no fundamental chemical manufacturing units of any great importance. Industry certainly could not be expected to build large chemical units for the production of dyes on the western prairies, when the raw materials and the ultimate markets are along the Atlantic seaboard. Even though these dye plants possess certain facilities for the production of intermediates, which might be raw materials for explosive manufacture, and the operations of nitration use raw materials and equipment, closely related to high explosive production, that was no reason for industry locating in these inaccessible districts prescribed by the procurement authorities. I challenge any criticism of industry as not having prepared itself for an emergency, the magnitude of which was entirely unknown, probably even to those responsible for the projection of the program. Industry cannot be charged with lack of preparedness to produce materials in a geographic territory where it could find no markets and which was unfavorably situated in respect to raw materials.

The program was passed to industry piecemeal, merely some additional capacity for a few reagents. Next were added units for the production of some finished explosives, then a few loading plants, hardly chemical in character. This first stage looks so insignificant as compared to the one recently handed us that we are somewhat bewildered.

We possess most of the technique of production, of design, but are wondering where the materials of construction and the manpower for operation are coming from. Chemical apparatus builders were geared to an industry that shows the flattest industrial curve of all industry and one that has not come into the equipment market on anything like the scale contemplated. We do face an equipment problem in meeting the schedule put before us.

The chemical industry has done its own engineering and finishing of its own installations. Both employ a very experienced technique. We have always been able to meet amply our own construction requirements in our peacetime program, but it is not so simple to expand indefinitely such organizations quickly. We therefore find ourselves spread very thin in competent technical assistance.

The factories are operating at capacity. It is expected that some of this capacity will be released with the restriction in the production of normal consumer goods, but it is very doubtful if much of this can be made available for munitions production, nor will it release many competent technicians, although there may be made available certain production labor of doubtful value in the munitions program. We are seriously viewing a difficulty with the draft boards, who are far from being sufficiently cooperative to understand that a competent chemical technician is not easy to replace.

I would like to emphasize a marked distinction between the chemical industry, particularly one producing munitions, and the ordinary manufacturing industry dependent largely upon machine tools. The machine tool receives a piece of metal which it reduces to specifications by a cutting operation. We might also include grinders, even forging equipment, in this classification. It is almost inconceivable that such a tool could be wrecked by even a poorly trained mechanic. At most, the piece under fabrication might be spoiled, but the damage to the tool would be relatively insignificant before it shut itself

A.

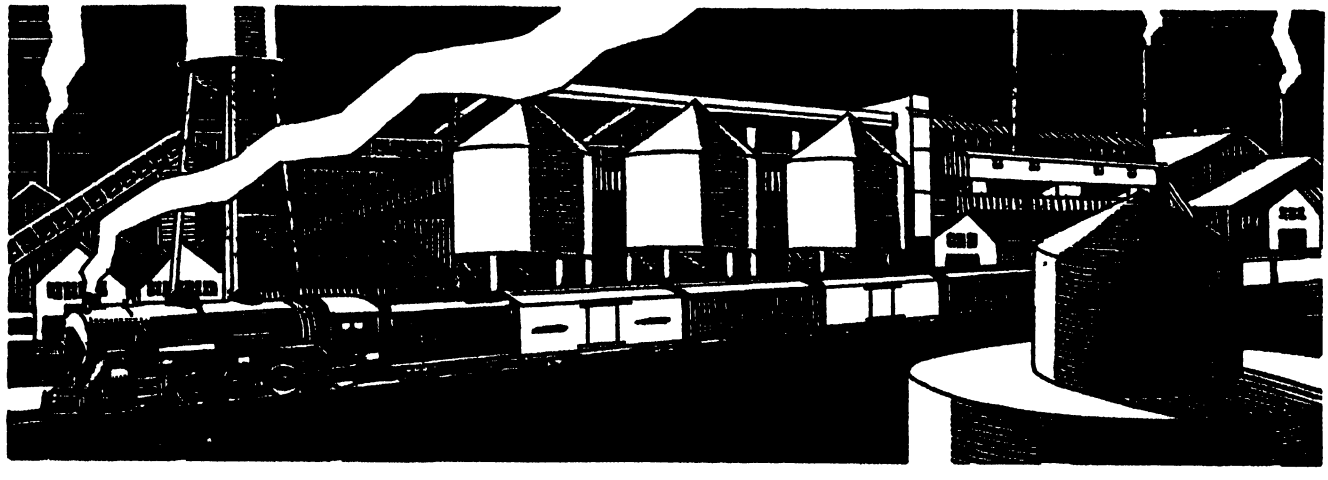
automatically off by either blowing a fuse or throwing a belt. In the chemical industry, however, we build the largest capacity equipment that economic conditions permit and subdivide this by weight or volume to meet the customer demands, not pound by pound or piece by piece as in the mechanical industry. Chemical reactions are often susceptible to very slight changes of conditions—in one case proceeding quietly to the required end, in another producing corrosive conditions that quickly destroy the equipment, or the reactions, even proceeding in an undesired direction and destroying the whole plant. It is not so much the case of destroying material immediately under production, as it is the protection of our plant from such unlimited destruction as may take one or more years to rebuild.

Many years are needed to develop a competent chemist. I am not referring to the operator who follows the prescriptions of the chemist and in types of production so simple that relatively little could go wrong. I am more particularly speaking of complex types of operations, where slight changes of condition may be noted and call for immediate countermeasures by a highly trained and experienced man to prevent widespread destructive action. These are the men who have spent four to six years in education and have years of laboratory and plant experience in acquiring a knowledge of all of the special conditions that might arise in carrying through various processes.

The problem of personnel becomes very serious in chemical plants producing explosives or dealing with the agents and intermediates which may develop dangerous conditions. We spread our units to limit the accidental destructive effects of a process going wrong. But this in turn requires more of the experienced type of supervision and control, the kind we lack most.



Another difficulty is the very great influence of local conditions. It is simpler to produce high explosives in the northern countries where plenty of cold water is available for service than in the South. It is a simpler problem to locate these plants where the necessary raw materials are easily procurable. Many of our raw materials require special types of package or transportation equipment. If we can locate nearer to these sources of existing production, some of which is going to become available as peacetime industry is curtailed, it will greatly simplify this problem of transportation and storage. Our plants of the type we are discussing have very complex and difficult waste disposal problems. Geography can play a very important part in facilitating the solution of this problem. Unfortunately politicians were more frequently consulted and their demands heeded than competent advice from the chemical industry in this problem of location. Fortunately this situation is improving, but only after costly mistakes that can hardly be rectified now.

I do not propose to discuss quantities and locations or give information which by any chance could be harmful to our national program. I am confining myself to broad principles. The chemical industry is taking on this construction work just as fast as our procurement divisions are prepared to release the projects. It is spreading itself very thin but will accomplish the task. It can find its place only in an order of priorities which are assigned to it although, being a pioneering institution, it generally finds means of accomplishment for it has been up against similar problems before. It must have a top priority in holding its man power. It cannot afford to lose operators, assistants, and supervisors, for these are the backbone of the expanded organizations. And yet we are running constantly against local draft boards refusing deferment of assistant operators whom we are holding for training to take responsible positions in the greatly expanded production units to come. We are prepared and want to assist in the location of these new units in the logical and most efficient centers.

In my opinion, the chemical industry will continue to produce a rather high percentage of its normal peacetime production. Many of these materials go directly into military and naval equipment without change in specification as peacetime goods disappear from the market. The military and naval requirements will probably take up most of the chemical supplies. The problem of raw material supply is going to be very serious because the explosive program draws upon the common heavy chemicals, such as acids, alkalies, and alcohols, all so essential in our peacetime production. How to stretch these supplies to take in the increased explosive program presents a grave and serious problem. It is one that industry can best solve but, unfortunately, industry has been called upon to supply relatively little talent that possesses the comprehensive knowledge of the interdependence of the units of the whole chemical industry. To my surprise, the other day, five prominent men in the chemical industry sitting around a table, were all of them entirely unacquainted with the top chemical consultant in the Office of Production Management. And of the upper staff only one, not an industrialist, was known by reputation.

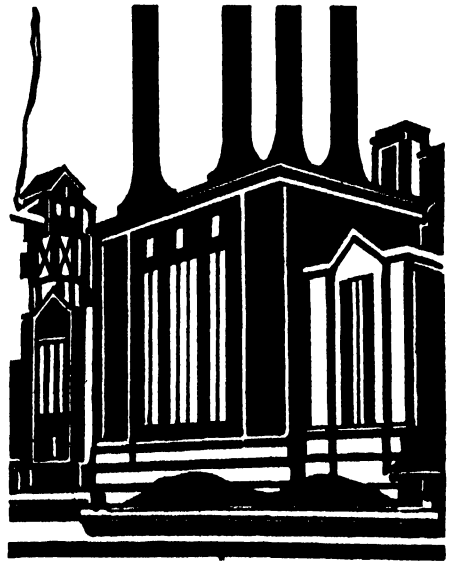
Some of the committees of the industry have been performing a wonderful service, but after all they are not more than advisory boards. If we are to carry out this program, there must be a better informed organization to solve the complex problems listed above.

We have a year ahead of construction and organization which will practically duplicate in structure and in value the entire manufacturing chemical industry. The present structure is going to operate to a very high degree of capacity in most of its units. We have to find an organization as large as we now possess to get this new unit into production, a task that will require the utmost exertion of anyone in the industry and all the competent help we can get from all sources. There will be no fads nor frills, and we will probably have to lay on the shelf many of our pet projects. No one will be released for lack of employment. There will be fewer holidays and longer hours for most of us. The future can be summed up in two words—"hard work".

Preparation of Plastics and Elastomers in Liquid Ammonia

RICHARD G. ROBERTS

Department of Biochemistry, Chicago Medical School, Chicago, Ill.

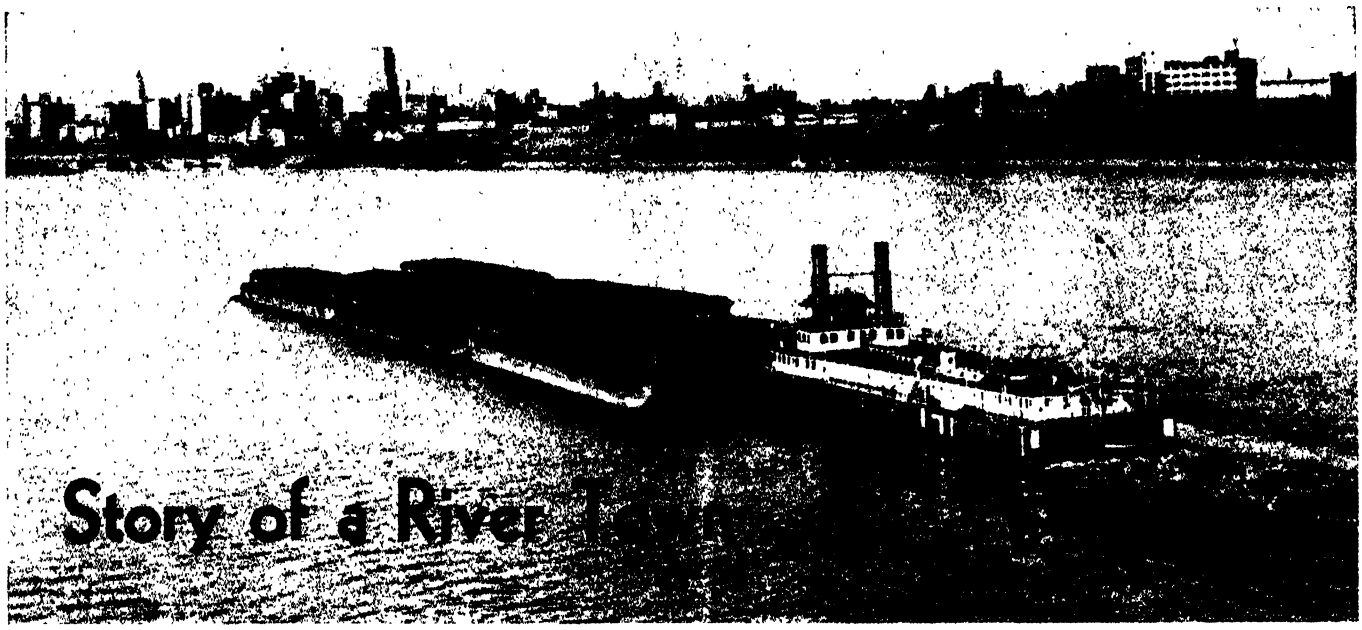


WHEN proteins such as casein and gluten are added to liquid ammonia in a suitable container, an exothermic reaction is initiated which results in the formation of a gel. If the container is left open to the atmosphere, the gel shrinks to a friable mass as the liquid ammonia boils away. If the container is kept closed, except for a connection to a mercury seal, however, the protein gel will shrink to one fourth its original size within 48 hours, forming a hard, tough, hornlike plastic. These plastics have a high tensile strength of 7,000 pounds per square inch. They will hold nails or screws with great tenacity, but the nails must be driven in slowly or the plastics will shatter. They can be sawed as easily as a hard wood or a phenol fiber board.

Experiments on reducing the tendency of these plastics to shatter were carried out in liquid ammonia upon elastic-forming substances, such as rubber latex and Thiokol derivatives, that might prove suitable when combined with the proteins. Rubber latex was found to coagulate instantly in contact with liquid ammonia. Its use as a matrix for holding the proteins, both before and after being placed in the liquid ammonia, therefore, was evident. Thiokol, as such, cannot be used as a matrix for powdered proteins and, if the proteins were added to the reagents used for preparing Thiokol in the usual way, the sodium sulfide and prolonged boiling would alter them unfavorably. Because of this, an attempt was made to prepare Thiokol in liquid ammonia.

When sodium sulfide, which is slightly soluble in liquid ammonia, is added to a solution of sulfur in liquid ammonia, an ammonia-soluble polysulfide is formed. If ethylene dichloride is added, a vigorous exothermic reaction follows with the formation of a heavy yellowish oil. The ammonia is allowed to evaporate, some water and casein or gluten, if desired, are added, and the temperature is quickly raised. At 70° C. a flocculent precipitate forms. As the boiling point is approached, the flocculent precipitate suddenly begins to coalesce, rapidly rises to the surface, and in less than one minute forms a tough, yellow, elastic layer which continues to float on the surface. When dichloroethyl ether was used in place of ethylene dichloride, no elastomer was obtained, but instead a black tarlike material found to be suitable for waterproofing cloth.

Some other elastic-forming substances were also studied. Milkweed latex coagulates in liquid ammonia, more slowly, however, than rubber latex, forming a resilient plastic that will not shatter. Goldenrod sap, obtained from the plant by extraction with benzene following an extraction with ammonium hydroxide, also gives a resilient plastic in liquid ammonia. Isoprene will polymerize in liquid ammonia with formation of a transparent rubberlike compound, but the market price is comparatively high. Development of stickiness in the coagulated latex after standing for two or three weeks caused some trouble. In general the latex coagulated in liquid ammonia seemed to be less sticky than that coagulated in acetic acid. Because of the proteins which were to be included in the new elastomer, a vulcanization at elevated temperatures was undesirable. It was found on trial that coagulated rubber latex by itself or in combination with other materials can be cold vulcanized in liquid ammonia at −33.4° C. by the addition of either flowers of sulfur or ammonium sulfide. Such cold vulcanized rubber has not developed any stickiness after two years.



Since it was possible to prepare both plastics and elastomers in liquid ammonia, the third step was an attempt to prepare a group of substances combining some of the desirable properties of the other two classes. When powdered casein or gluten either alone or mixed with other substances such as powdered egg shells, magnesium powder, or iron oxides are quickly stirred into rubber latex, a dough is formed which can be rolled into any desired shape and dropped into liquid ammonia. The latex coagulates, the dough swells to twice its original size, and a vigorous exothermic reaction takes place. As the ammonia boils away, the dough again shrinks to less than its original size, leaving a hard, tough, resilient plastic.

Properties of this plastic depend upon the quantities of the various materials used in forming the dough. With as little as 15 per cent of solid latex, either casein or gluten forms a resilient substance that is nonporous and has considerable stretch. Above 15 per cent latex the substance resembles elastomers, and below 15 per cent plastics. Addition of finely pulverized egg shells, which themselves contain a protein, increases the toughness. Powdered magnesium, which is the least reactive metal soluble in liquid ammonia, adds hardness and lightness forming a plastic which floats on the liquid ammonia or on water. Black oxide of iron adds extreme hardness and density. Examination of these new substances under magnification indicates that the latex and proteins react to form a new compound and not merely a fine-grained mixture. These new resilient plastics or plastic-elastomers are insoluble in ethyl alcohol, but some of them which contain none or a slight amount of rubber will swell and soften if left standing in water. This tendency can be decreased by the usual treatments with formalin or lime water or by treating the substances in liquid ammonia with hexamethylenetetramine or aldehyde ammonia. Gluten is preferable to casein, which has so many uses in plastics, glues, and paints, because its plastics prepared in liquid ammonia are less soluble in water. By this method plastic-elastomers may be prepared from comparatively inexpensive domestic materials already produced in large amounts.

The manner in which liquid ammonia brings about the formation of protein plastics is unknown. Previous work[1] with regenerated cellulose has shown that treatment with liquid ammonia increases the tear strength by 200 per cent, tensile strength by 70 per cent, and weight by 27 per cent with a decrease in area of 24 per cent. With casein plastics made in liquid ammonia the volume decreases by 75 per cent in passing from a tough gel to a translucent hornlike stage. The Kjeldahl nitrogen increases from 75 to 300 per cent in various proteins, and in some of these materials, which could also be used as fertilizers, the nitrogen content of the water-insoluble fractions increases by as much as 100 per cent. These gains in nitrogen content are probably due to both ammonolysis and ammonation, and are certainly accompanied by types of bonding which can account for hardness, toughness, and high tensile strength.

Story of a River Town

Barges serve the modern port of Memphis

CHILD of cotton, nurtured by the river, Memphis grew in the lusty age of river traffic and the westward expansion of the South. In its early days, Memphis was a rendezvous of free booting river men and planters of the white gold. Yet despite this virile heritage, the city would have died but for the determined efforts and heroic toil of the doctors, public health technologists, chemists, and engineers who brought it through its hour of trial. Memphis pays tribute to the scientists of that day and will welcome their present-day successors when the AMERICAN CHEMICAL SOCIETY meets there, April 20 to 24.

Examination of the city's records shows its history to be divided into two parts. At first the story concerns the troubles of a small town that was gradually growing too big for its breeches. Coming practically unscathed through the Civil War, the city was booming through the 70's when it received a blow that nearly knocked it out. In 1878 the dreaded yellow jack hit the town with all the force of a homesick hurricane. It was then that the scientists of the day took over and rebuilt the sick and almost depopulated town into the healthy and thriving city it is today.

It had been a long hard road from the time that Hernando DeSoto first stumbled into the muddy waters of the Mississippi. Three countries, Spain, England, and France, had laid their claim to the territory in which Memphis is situated and had engaged in a long fight for control of the bluff territory. Even in 1783, when the United States gained nominal possession of the bluffs, Spain still labored under the impression that the Mississippi Valley was her private property. Soon after Tennessee was admitted to the Union as a state in 1796, the Government found it necessary to establish a military post, Fort Adams, at the site of Memphis to curb the ever increasing influence of the pugnacious Spanish.

This proving ineffectual, President Washington in 1798 authorized a new structure, named Fort Pickering, to be located several miles down the bluff. The new fort afforded ample protection and from then to 1819 life on the lower bluff was that of an ordinary peaceful frontier outpost.

In 1819 the town of Memphis was laid out by the owners of land grants—John Overton, James Winchester, and Andrew Jackson. General Jackson, however, severely criticized for his interest in land operations in this territory, sold his claims to John McLemore in 1823 to save himself from future political embarrassment.

Memphis suffered but little, being born in an age when towns, like Topsy, just grew, and city planning was as yet not taught in the universities. The site was exceptionally well laid out—362 lots were laid off on the lower bluff with wide streets and four public squares named, according to their purpose, Auction, Court, Exchange, and Market. Lots were to be sold to actual settlers only, and payment for them was to be completed within five years.

Although four names are mentioned prominently in the annals of the founding of Memphis, it was one man, John Overton, who was directly responsible for the making of the town. Judge Overton, single handed, looked after the multitude of details that are the natural consequence of the start of a new venture. It must be said, however, that his absorbing interest was not primarily for the future of the country or for personal acclaim, but largely for the accumulation of wealth.

Memphis, blessed by a particularly advantageous location, was settled rapidly. Settlers were chiefly Germans, who were thrifty farmers, mechanics, and home builders, and Scotch-Irish, who were the adventurers, politicians, and land speculators. Geographical influences affecting the growth of Memphis are numerous. The lower Mississippi stood in need of a port midway between New Orleans and St. Louis. This central position later made it a terminal of almost every railroad, thus placing it on the east-west as well as the north-south trade routes. Located in the heart of the richest cotton region in the world and one of the most extensive hardwood lumber forests in the United States, Memphis has long served as a shipping point for these raw products. Because of the vast distances between the cities of the South, Memphis has annually distributed large quantities of manufactured goods and raw materials to a huge hinterland. In any discussion of Memphis there must be constant reference to cotton and lumber, river and railroad, marketing and distribution.

From 1820 to 1860 the city's growth was phenomenal. Prior to this time the Southwest, including Alabama, Mississippi, Arkansas, Louisaina, and west Tennessee, had only two thirds as many inhabitants as the state of Kentucky alone. Yet during the brief span of 40 years, from 1820 to 1860, this southwestern region, with the addition of Texas, became three times as populous as Kentucky, whose density of population had meanwhile doubled. As the Southwest went, so went Memphis, its population jumping from 53 in 1820 to 22,623 in 1860.

This spectacular gain can be ascribed very largely to cotton. Whitney's gin was invented. There was a rush west-

ward for the richer land obtainable. There was a demand for cotton buyers and factors, the planters having learned early that they lost money trying to dispose of their own crop. Planked roads were bringing neighboring towns nearer and were winning much of the cotton from the hills of north Mississippi. Larger and larger steamboats were plowing the Mississippi and its tributaries. Four railroads constructed in the 50's completed its transportation system. Memphis became the largest inland cotton market in the world. In 1860 roughly 400,000 bales of cotton valued at $16,000,000 were handled in a single season.

The boom was on with a vengeance. Prophets of the day were saying, "It is destined in our opinion to be the largest city in the Southwest. . . . . If Memphis would be great she must make railways and build factories." Real estate and slave values reflected the temper of the times. A piece of property worth $200 in 1850 sold five years later for $2,000. Buildings rose by the block, and the prices of slaves soared. While field hands cost only from $750 to $1,000, carpenters were selling for $2,500, blacksmiths' hammerers for $1,114, and painters for $1,005.

For a while everyone was happy—a slave in every house and two chickens in every pot. But when the end came it came suddenly and without warning. In 1860 the temper of the town was western in every respect; by 1861 it was rapidly southern and caught in the emotionalism of the early days of the War between the States. By 1862 it was in the hands of Commodore Davis of the federal fleet. Military rule was established, merchants were required to obtain federal permits to do business, families of men absent in the Confederate Army were compelled to leave the city, and many were made prisoners.

On July 3, 1865, by order of General John E. Smith, military authority over municipal affairs was ended. The dark days of the war were officially over.

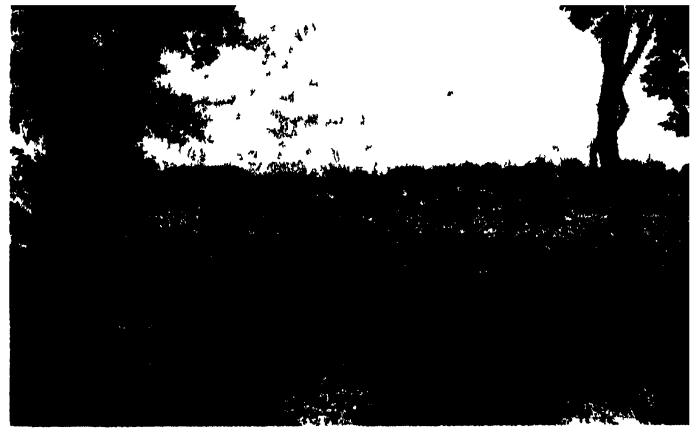
Having been occupied by federal troops almost from the beginning of the conflict and but occasionally harassed by daring raids of General Nathan B. Forrest, Memphis had not materially been hit by the civil strife. There were no great areas of burned and pillaged buildings, no gaping shell holes and other phenomena usually brought about by war. There were, however, more serious problems at hand. The city had held its own, but its hinterland in Mississippi, Arkansas, and Tennessee had been sacked. Millions of dollars had been lost through the emancipation of the slaves as many planters held all of their tangible assets as slaves. Levees and railroads had been destroyed. Between 1860 and 1870 the negro population had increased from 3,000 to 15,000, creating a race problem where one had hardly existed before. There were four distinct unassimilated groups in the city—the Negroes, federal soldiers, northern merchants, and natives.

Returning confederate soldiers, dismayed though they were with the new Memphis, nevertheless accepted the new situation and began to rebuild. During these new formative years, they were constantly harassed by the reconstructionist, carpetbagging East Tennessean governor, "Parson" Brownlow. Of Brownlow, little that is good may be said. By such methods as disenfranchisement of 80 per cent of the money and landed interests, organization of his own militia, use of federal troops and a muzzled judiciary, and the rushing of a Negro franchise act through the legislature before even the Negro knew what he was voting for, and other extra-legal methods, he was able to control the State through two terms as governor. The disenfranchised Confederates, having no resort to the ballot box, turned the social organization of the Ku-Klux-Klan into a vigilantes association and joined battle with the Brownlow militia and the Union League. In January 1868, Negroes were given the right to hold office and to serve on juries. A severe Ku-Klux act was passed the following autumn, and civil war was imminent. Only the concerted efforts of 13 ex-confederate generals of the State prevented bloodshed at this time. The *New York Herald* said, "The only state that is in the hands of a born swaggerer and bully. . . . It is a pity that the country should hear the murmur of war, even though faintly, simply because an irritable, ill-natured, narrow minded, and pugnacious man happened to be governor of Tennessee."

Yet in the face of these dismaying factors, Memphis by 1870 had doubled its population. The city had rebuilt four railroads, two new lines were under construction, and roads to St. Louis, Kansas City, and El Paso were projected. Cotton, still thousands of bales short of its 1860 peak, was much dearer because of the high postwar price. Banking capital was short of the 1860 total by $300,000, but increased insurance funds more than made up the difference. Eleven steamboat lines averaging 16,306 tons were operating boats out of its harbor. It led the United States in the production of cottonseed oil with an annual output of 74,000 barrels. The city listed five daily newspapers and three suburbs among its assets. To top the cake, the central location of Memphis was already making it popular as a convention town, for the National Typographical Union held its annual meeting there in 1867. The lusty young giant of a river town was now back in its stride and was preparing to enjoy the fruits of a commercial prosperity, all blissfully ignorant of the dark days ahead.

It was in the years between 1873 and 1880 when there were both the tragic era and the transition of Memphis from an oversized town to a city. In general, the health of Memphis from its inception was wretched. Situated on high ground in the midst of a swampy region flooded annually by the waters of the Wolf and the Mississippi Rivers, it was only natural and expected that its citizens would be subject to the chronic ailments of the lowlands—chills and fever. Sanitary conditions at the time were perhaps no better than the poorest medieval borough. The water supply consisted of defective wells and cisterns, supplemented in 1873 by a plant reputed to purify river water. Milk was both polluted and diluted. According to the *Ledger*, the streets were "huge depots of filth, cavernous Augean stables, with no Tiber to flow through and cleanse them". The thousands of privy vaults drained into Gayoso Bayou, once a brisk stream but now a series of stagnant pools, separated by dams of decaying organic matter and human excrement. Under such conditions, the early August docking of a steamboat to put off two sick passengers was but a prelude to disaster, for within two days the passengers had died and the yellow fever was spreading rapidly through the lower buff. By the first of September the disease had spread to the top of the bluff. On the ninth the board of health at last recognized the malady for what it was, and issued a warning that the fever was epidemic. Then began an exodus that lasted until only 15,000 were left of a total population of 40,000. Those remaining, mostly Negroes who seemingly were immune, had no alternative but to let the fever spend itself.

When the frost came in October, followed closely by a sharp freeze, the end of the epidemic was announced. Immediate signs of recovery were not apparent. Thousands of refugees failed to return, and the debt became so pressing that the city surrendered its charter and became a mere taxing district of the State.

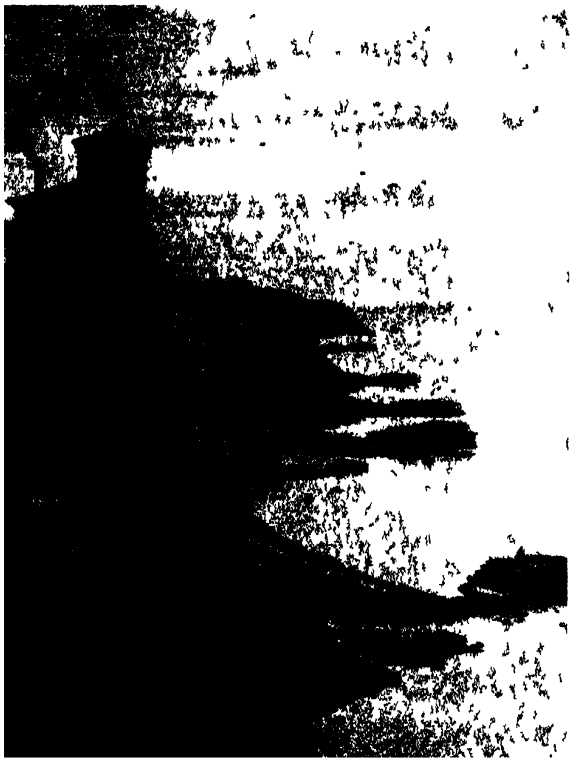


Though Memphis suffered more than most American cities, unsanitary conditions were general throughout the Nation until the end of the century. In the last half of the 19th century, as a result of the experiments of European scientists like Louis Pasteur and Robert Koch, preventive medicine made significant advances. Their disciples in America were men like William H. Welsh, William Osler, and Hermann Biggs. The work of such men finally resulted in the formation of the Public Health Service in 1902.

The fever in Memphis was of more than local significance; it was an event of immense national importance, for it aroused the country to the ever-present threat of disease at the very time that the discoveries of Pasteur and Koch were being disseminated. The experience of the city was a warning to the Nation, and the sanitary campaign upon which it embarked proved an inspiring example.

The devastating effects of the epidemics and subsequent conditions left Memphis in worse shape than in the dark days of

Sketches from Old Memphis



A. C. S. Meeting April 20 to 24

Above. Memphis under quarantine rule in 1873 The method of bringing food into the plague-stricken city. From sketches by Moise. *Below.* The cotton levee in Memphis before the war

The Memphis levee in the 90's

Reconstruction The city charter was not restored until 1893. Trade volume, however, returned to the improved city and by 1890 Memphis had grown in population to 64,589. The Mississippi River was spanned with a railroad bridge in 1892, the first south of St. Louis, and in 1909 the Harahan Bridge, with double railroad tracks and double vehicle passageways, was built. The bridges increased trade with the Southwest, and Memphis became the greatest cotton market and hardwood lumber center in the world

From the turn of the century to the present, the city's history has been that of any ambitious town in a period of commercial and industrial expansion. Enlarged by repeated territorial acquisitions, the city has long since outgrown the peripheral parkway outlining its limits in 1909 and has engulfed seven suburban communities. With a population of over 300,000 it is one of the most rapidly growing cities in the Nation. This is due as much to its recent industrial development as to its increased importance as a commercial and business center.

A measure of this recent expansion is the rapid increase in the chemist population of Memphis. Several attempts had been made to arouse interest in a local section of the AMERICAN CHEMICAL SOCIETY, once in the early 20's and again about 10 years later. At neither time, however, were there the minimum 20 members required to petition for a charter. By 1939, through establishment of many new industries and expanded operations of several old ones, a number of additional chemists had been brought to Memphis, and another start was made. An organization meeting in January of that year was attended by 50 chemists of Memphis and the near-by University of Mississippi. Twenty-three of these were members of the SOCIETY, and a petition was drawn up for the establishment of a local section.

The Memphis Section was chartered with 38 members at the Baltimore meeting in 1939. Activities of the local section then made membership in the AMERICAN CHEMICAL SOCIETY more attractive, and local support zoomed. In 1942 more than 100 members are enrolled and taking an active part in the preparations for the 103rd meeting. This meeting will be the climax to three years of intensive effort through which the Memphis Section has become one of the fastest growing sections of the SOCIETY. With not enough chemists in Memphis to start a group 10 years ago, the industrial and chemical expansion has attracted enough chemists to the city to build a strong section which within three years of its founding is to be host to the entire SOCIETY.

This, however, is but the epitome of the city itself and a token of the future destiny of the capital of the midsouth. Situated in the richest agricultural region in the Nation, Memphis is bound to play an important role in the rising chemical and industrial development of agricultural products.

The bluffs that witnessed the passing of the French and the Spaniards have seen the magnificent steamboats of the 80's resolve into the quiet efficiency of the present-day barge. Gone are the flatboatmen, the slave traders, and the carpetbaggers. In their places are a new people who have built bridges, erected tall buildings, and founded an industrial center in the midst of an agricultural empire.

Memphis in its heroic age was a strident river town. But it has kicked off its boots caked with Mississippi mud, augmented its cotton and hardwood income with factory payrolls, and is today the metropolitan center of the new South. Looking for the future to the increased industrial development of its agricultural wealth, Memphis welcomes the AMERICAN CHEMICAL SOCIETY as a guide to the new era—when agriculture will be fused to industry—through chemistry.

Basic Patent Covers Bridge-Type Instruments

U. S. PATENT 2,263,932, electronic signal indicator and circuit therefor, has been issued to Nathan Schnoll, Palisade, N. J., and assigned to Industrial Instruments, Inc., Jersey City, N. J. This patent provides the basis for industrial instruments such as the Solu-Bridge and Solu-Bridge controller, as well as laboratory instruments of the conductivity bridge type, incorporating an alternating-current-operated Wheatstone bridge with a cathode null indicator.

Harahan Bridge across the Mississippi at Memphis

Division of Rubber Chemistry Postpones Meeting

THE meeting of the Division of Rubber Chemistry scheduled for April 1942 in Memphis, Tenn., in conjunction with the 103rd meeting of the AMERICAN CHEMICAL SOCIETY, has been cancelled by unanimous action of the Executive Committee, H. I. Cramer, Secretary of the division, reports. This action was taken after a survey of the principal laboratories in the rubber industry disclosed the universal sentiment that the time and energy of all technical men within the industry should be directed unstintingly to problems growing out of the present emergency. The committee concurred and agreed that the interests of the war program would be served best if the division deferred meeting until the Buffalo convention next September. By that time the present state of flux in all matters related to rubber should have crystallized to the point where a beneficial and successful program centered around vital problems of the industry can be organized. More detailed plans for the fall meeting will be announced in May.

Philadelphia Section Sponsors Home Defense Course

A PRACTICAL course in home defense is being given by the Speakers' Bureau of the Philadelphia Section, AMERICAN CHEMICAL SOCIETY, on consecutive Friday evenings at the William Penn High School, 15th and Mt. Vernon Streets, according to Donald L. Gibson of the Publicity Committee.

The original course was mapped out by Captain Joseph Chandler, Chemical Warfare Service Reserve, and includes civil air defense and chemical warfare defense. The lectures will include and have covered such subjects as air attack, first aid for gas attack victims, use of a gas mask, and identification of chemical agents and poison gas. Most of the instructors are present or former Chemical Warfare Service officers.

Cooperation of the Junto (Philadelphia's Adult School), the Philadelphia Section, Williams, Browne, and Earle, Inc., Arthur H. Thomas Co., and The Philadelphia Police College has contributed this valuable course of instruction.

With the A. C. S. in Hawaii

AN ENCOURAGING report on how chemists responded in an actual war situation and some helpful suggestions on how they may be organized for service are contained in a letter to Secretary Parsons written under date of January 23 by the Hawaiian Section Councilor, J. H. Payne, who says:

The Hawaiian Section has been active in the recent emergency. Being the first section of the A. C. S. under fire (and we hope the only one), unique problems have arisen of course. We prepared immediately a roster of all chemists in the Territory so that we could have a record of what each was doing during the emergency and who would be available for specialized tasks. A committee to coordinate cooperation with the local armed forces here was organized. This committee consists of A. L. Dean, H. D. Kirschman, Allan Duvall, and J. H. Payne, chairman.

We have already rendered some good service on three important projects, one for the Navy and two for the Army. This type of front line work is unique to most of us, but I assure you that members of the Hawaiian Section are performing in a highly commendable fashion. Please spread the word that Hawaii has the situation in hand and always will.

Teaching Fellowships Offered at New York University

A NUMBER of teaching fellowships in chemistry are available for the academic year 1942–43 in the Washington Square College of Arts and Science, New York University. Applicants should expect to receive their bachelors' degrees this June, having majored in chemistry.

These fellowships are offered on the basis that the recipient will carry on work in the graduate school leading to the doctorate. For this reason part of the remuneration is in the form of free tuition, equivalent to $200, for three full courses annually in the graduate school. There is an additional annual stipend of $700. Reappointments are made on the basis of scholarship and proficiency in teaching. Teaching fellows spend an average of 10 hours per week instructing in the laboratory and additional time to grade the papers and keep records for their students.

For application forms and further information, address William C. MacTavish, Chairman, Department of Chemistry, Washington Square College of Arts and Science, Washington Square, New York, N. Y. All applications should be received not later than April 1. Appointments will be made early in April.

Sets of Abstracts

AS USUAL, sets of abstracts of meeting papers in planographed book form will be supplied by the A. C. S. News Service, 1155 16th St., N. W., Washington, D. C. Sets are not guaranteed to be complete, but contain abstracts from all divisions as submitted by authors. The abstracts will be mailed as soon as possible after receipt of order, beginning about April 15, and will also be on sale at Memphis, Tenn.

This enterprise is undertaken in a spirit of service and not for profit. Sets are offered on the following terms:

To members of divisions who forward receipt for divisional dues with remittance and order, 50 cents.

To those without receipt for divisional dues, who remit with order, $1.00.

To those who fail to enclose remittance with order, necessitating correspondence, $1.25.

To those who require bills to be rendered, $1.50.

Objective Tests in Organic Chemistry

DURING the past school year over 25,000 copies of the cooperative objective tests in organic chemistry were distributed to over 100 colleges and universities.

The 1942–43 series is now nearing completion, and will cover the following topic examinations:

Alkanes, alkenes, alkynes
Alkyl halides and halogen compounds
Alcohols, ethers, halohydrins, and alkene oxides
Aldehydes, ketones, ketenes
Acids, saturated and unsaturated
Halogen, hydroxy, and oxo-acids
Anhydrides, acid halides, esters, and salts
Classified replacement reactions
The carbohydrates
First semester examination, Nos. 1–9
Thioalcohols, thioethers, sulfonic acids
Nitroparaffins, amides, urea, urea derivatives, amines, amino acids, proteins, nitriles, and isonitriles
Foods and metabolism
Organo-nonmetallic and metallic compounds
Alicyclic compounds
Benzene, naphthalene, anthracene
Aryl halogen compounds
Phenols, aryl alcohols, ethers
Aldehydes, ketones, quinones
Aryl carboxylic acids
Aryl sulfonic acids
Aryl nitro compounds, amines, and diazonium salts
Heterocyclic and miscellaneous compounds
Antiseptics, dyes, stains, and indicators
Terpenes, rubber, resins, fibers, detergents
Processes, reactions syntheses, and tests
Second semester examination, Nos. 10–26.

These tests are said to represent an improvement over the 1941–42 series with respect to both construction and use. Validity data will be supplied with each set so that of the 20 items appearing on each test, the instructor may select only a few of the more valid items and thus adapt the test to a 5-, 10-, 15-, or 20-minute quiz.

Complete sets are available to instructors of organic chemistry, industrial chemists, or graduate students at 20 cents per set in lots of five or more, if orders are received on or before July 1. Subsequent to that date the minimum price will be 25 cents per set. All sets ordered in lots of less than five are 50 cents each. Orders should be sent to the chairman of the committee, Ed. F. Degering, Department of Chemistry, Purdue University, Lafayette, Ind.

Origin of the Clerget Method[1]

C. A. BROWNE — U. S. Department of Agriculture, Washington, D. C.

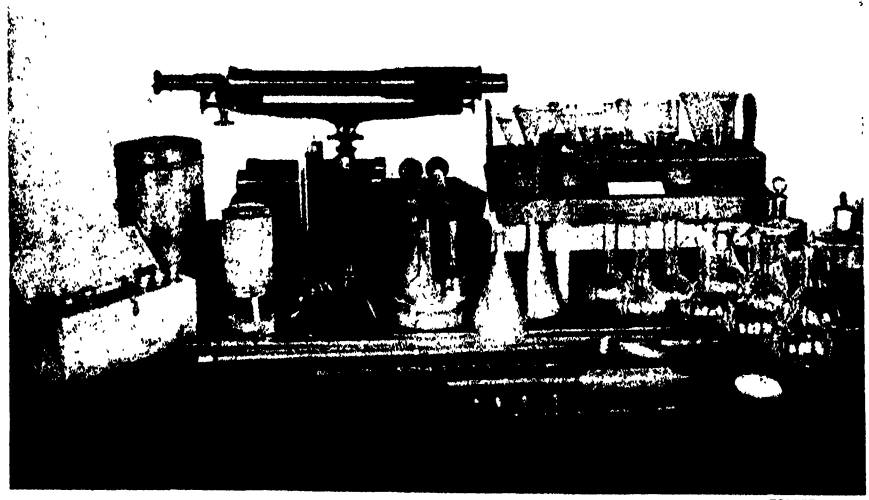
THE earliest contribution by Clerget relating to the method of double or invert polarization, which bears his name, is found in a short notice in the weekly *Comptes Rendus* of the French Academy of Sciences for May 8, 1843[2], entitled "The Analysis of Sugars by Polarized Light". The article is short, and I have made the following translation:

The beautiful observations of Monsieur Biot upon the phenomena of polarized light indicate the utility in qualitative and quantitative analysis which can be derived from the optical properties of solutions of many substances. This utility would be especially very great for industry when a practical determination of the nature of the sugars or of the richness of saccharine liquids is desired. The formulas which Monsieur Biot has given in his memoirs furnish the complete solution of the problem which, however, does not seem to have been generally applied to its full advantage.

In my opinion this is due to the fact that these formulas, because of their precision and need of the use of logarithms, demand an expenditure of time that cannot ordinarily be given, principally for the reason that they require for one of their elements an exact determination of the density of the liquids under examination by means of the balance.

This consideration has caused me to seek means of simplification, and I have developed a process of fixed weights which eliminates density determinations. It is based upon the numbers, obtained by the single addition of two figures or by simple subtraction, which permit the weighable quantity of crystallized sugar contained in mixtures to be read off directly in hundredths upon the divided circle of the observation apparatus.

This statement clearly indicates that Clerget's method, so-called, is simply a practical modification of an analytical polariscopic procedure previously elaborated by Biot who was the actual originator of the process. The story of Biot's part in the development of the method of double polarization is now almost forgotten.



In 1834 Dr. Pallas, head physician of the military hospital of Saint Omer and owner of a maize plantation in French Africa, presented to the French Academy of Sciences an interesting observation on the apparent changes in sugar content of cornstalks during their period of growth. The question was referred by the academy to a joint committee of chemists and physicists who after consultation recommended that Pallas be encouraged to continue the investigation which gave promise of leading to conclusions of scientific and industrial importance. In a later report Pallas stated that, if the ears of corn were removed at the beginning of their development, the sugar content of the stalks seemed subsequently to undergo a considerable increase. This important observation was referred by the academy to another committee of distinguished scientists, consisting of the agricultural chemist Boussingault, the physical chemist Regnault, the industrial chemist Payen, and the physicist Biot, who reported that the conclusions were of such importance to plant physiology and industry that the problem would be taken over by Professor Biot for accurate analytical verification. Biot's brilliant solution of this problem, contained in the *Comptes rendus* of the academy for 1842, verified Pallas' statement as to the increase in sugar content of cornstalks as a result of removing the ears. But it also marked the establishment of a new polariscopic method, using the principle of inversion, for determining cane sugar in mixtures of other sugars—a now universally employed method which has been of inestimable value to pure science, to agriculture, and to industry in all parts of the world.

Only the main steps in Biot's development of the double polarization formulas that he employed in this work will be given. For details reference is made to the original article by Soubeiran and Biot, entitled "Recherches expérimentales sur les produits sucrés du maïs"[3], of which the year 1942 is the centenary.

Biot found that when a solution of pure cane sugar was inverted in the cold for 4 to 5 hours with 0.1 its volume of hydrochloric acid, a direct reading of 1 circular degree on his instrument was changed to −0.38 circular degree or a difference of 1.38 circular degrees when correction was made for dilution. For sulfuric acid the factor under the conditions of his experiment was found to be 1.3867 for a solution of pure sucrose. For a similar volume of clarified cornstalk juice under the same conditions an average invert reading of −0.3411 circular degree was found on five samples for each degree of direct reading which gives a difference of 1.3411 circular degrees. Then $\frac{1.3411}{1.3867} = 0.967116$ which is the sucrose equivalent for each circular degree of direct polarization of the juice. We have here for the first time in scientific literature the introduction of what we now term the Clerget factor, but which in justice to the man who originated it should be renamed the Biot factor.

Direct polarization of the juice from the cornstalks from which the ears had been plucked, calculated to a tube length of 500 mm., was found by Biot to be 42.02 circular degrees which, multiplied by 0.967116, gives 40.64 circular degrees as the polarizing power of the sucrose in the juice. For converting circular degrees (S) obtained in a tube of L mm. length into grams of sugar per 1 cc. Biot employed the formula $1.4\frac{S}{L}$ which, divided by the density of the juice, gives the weight of sugar in 1 gram of juice. In this way Biot found the weight of sucrose in 1 gram of juice from the cornstalks on which the ears had been removed to be 0.1066 grams or 10.66 per cent and from cornstalks on which the ears had been left to be 0.0815 grams or 8.15 per cent, equivalent to an increase of 2.51 per cent sucrose as a result of removing the ears.

This is the first application of a classic method of sugar analysis now common in

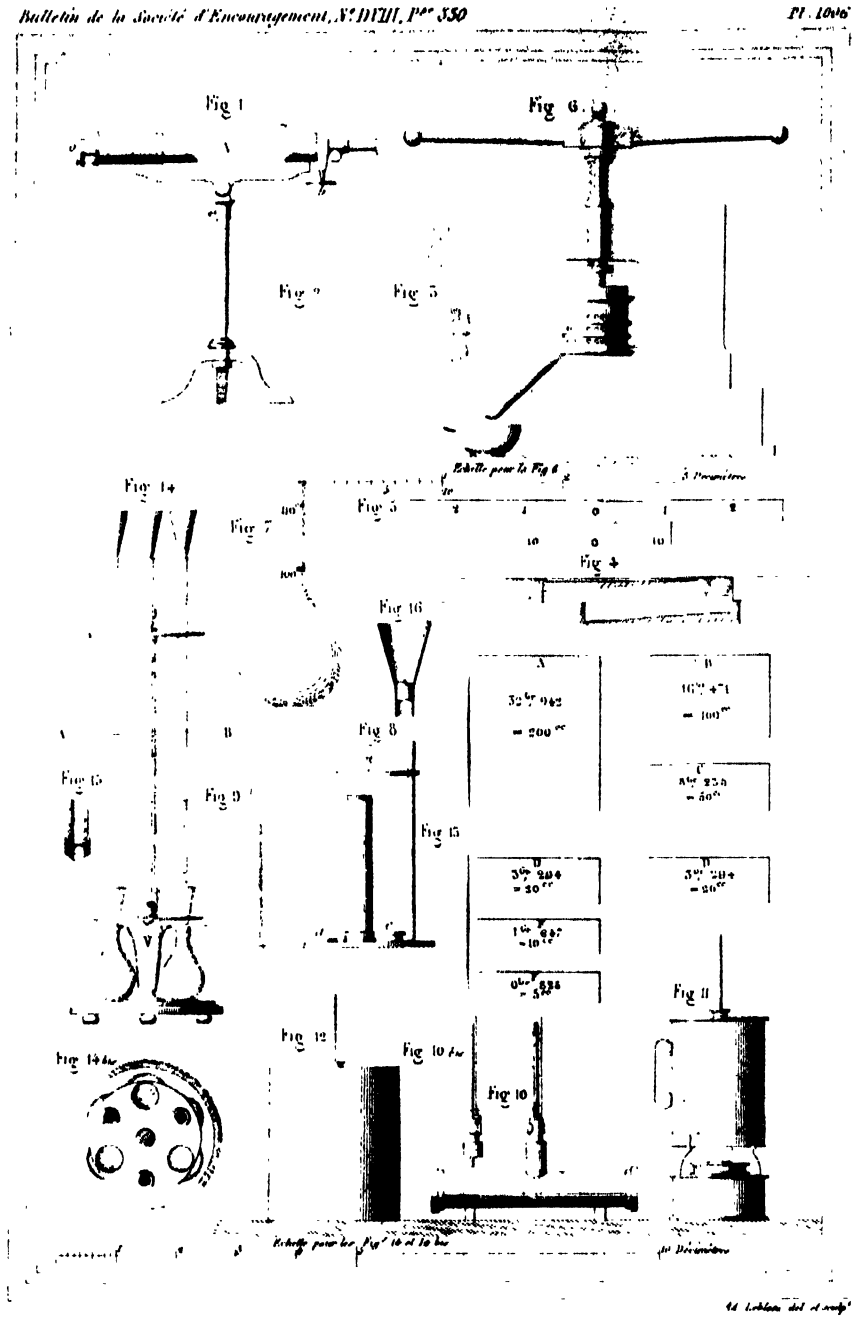
Column 3 (l)	Lengths in millimeters of the observation tubes in which the direct polarisations were made
Column 4 (α)	Direct angular polarisations using the bluish violet transition tint of the field as the end point (a Soleil double quarts end-point device was used, as the half-shadow polariscope had not yet been invented)
Column 5 (l')	Lengths of the tubes, variable as in the previous case, in which the invert polarisations were made
Column 6 (α')	Original direct readings recalculated to tubes of length l'
Column 7	Nature of the inverting acid which is sulfuric
Column 8	Degree of dilution of the original juice produced by addition of the inverting acid which is $^{5}/_{9}$ths
Column 9 (α'')	Recalculation of the revised direct polarisation (α') to correct for this dilution
Column 10 (α''')	Observed invert reading in tubes of length l'
Column 11 $\left(\frac{\alpha'''}{\alpha''}\right)$	Calculated value of the invert polarisation for 1 circular degree direct polarisation of the juice
Column 12	Same value for pure sucrose which, with sulfuric acid as the inverting agent, was found to be −0.3867, temperature and other conditions being the same as in the juice experiments

thousands of research and industrial laboratories in all parts of the world. A glance at the original record of Biot's brilliant polariscopic determination of the sucrose content of cornstalk juice helps in evaluating the part which Clerget played later in applying his teacher's discovery to practical sugar laboratory conditions.

Page 536 from the *Comptes rendus* of September 12, 1842, gives the observational data of Biot's analyses. The upper half of the table relates to the juice of the cornstalks with ears removed and the lower half to cornstalks with ears unremoved.

An interesting feature of this table is Biot's employment of curved arrows pointing to the right and left as well as plus and minus signs to indicate directions of rotations of his direct and invert readings.

Biot used seven different observation tubes of odd lengths such as he no doubt had available in the miscellaneous equipment of his laboratory. He made no attempt to standardize his method, which would have enormously simplified the labor of calculation. As a pure physicist he was not interested in commercial and industrial applications of the principle he had discovered. Biot turned this phase of the problem over to his pupil, Clerget, who in a most masterful way completely revised the technique of his method without any change in the principles involved.



The first important change Clerget introduced was substitution of the new Soleil saccharimeter with a 100-degree point sugar scale for the circular scale polarimeter. Instead of apparatus of variable dimensions, carefully standardized tubes and flasks of uniform construction were used. Instead of making calculations upon the basis of density alone, as was done by Biot, Clerget introduced an optional procedure for sugar and molasses in which a normal weight of product was

Original tabulation of Biot's results in determining the sucrose content of corn juice by his method of inversion

Original apparatus of Clerget for analyzing sugar products by Biot's inversion method
(Compare with photograph, page 322)

taken. Improvements in clarification with gelatin and alcohol, lead subacetate, and animal charcoal were introduced to obtain water clear solutions (any trace of color interfered with the readings on polariscopes with a tint end-point device). The process of inversion was carefully formulated, with emphasis on temperature control. A complete table was constructed to simplify the calculation work. All these improvements with minute directions and practical examples of procedure for analyzing sugar canes, sugar beets, and different sugar factory and refinery products were described by Clerget in a memoir which he read before the Society for the Encouragement of National Industry on October 14, 1846, and published for distribution in pamphlet form in the following month. A plate of this classic treatise shows all the beautifully constructed apparatus that Clerget devised for the performance of his method. Except for later improvements in certain details the process followed today is essentially the same as that described by Clerget 96 years ago.

At the Louisiana State Museum in New Orleans is an almost complete original set of Clerget apparatus exactly as illustrated in the old plate and as pictured on page 322. The Soleil saccharimeter, tubes for direct and invert reading, set of normal weights, weighing scoop, long tubes for bone-black filtration, flasks, funnels, tempering baths, hydrometer, and other equipment are identical with those shown in the plate of Clerget's original publication. This collection of old sugar testing apparatus is one of priceless historic value and it is hoped that the New Orleans members of our AMERICAN CHEMICAL SOCIETY will see that it is always well taken care of and preserved for the benefit of future generations.

This covers briefly the facts relating to the origin of one of the best known and most beautiful analytical procedures in the history of chemistry. It should be of particular interest to American chemists since the impelling motive which caused Biot to develop the principles of this method was the solution of a problem concerning the sugar content of the stalks of America's chief agricultural crop—Indian corn. And whenever we employ the Clerget method let us be as mindful of the originator of the process, as was Clerget himself—the originator not only of the Clerget process but of the polariscope and the founder of the art of polarimetric analysis—Jean Baptiste Biot.

Lactic Acid Replaces Formic Acid for Many Brazilian Uses

LACTIC acid has in recent years displaced to some extent the use of formic acid by Brazilian tanneries and other industries, according to a U. S. Department of Commerce report. Only relatively small quantities of lactic acid are used for edible and pharmaceutical purposes. According to the latest figures reported, imports in 1939 were lactic acid, 18,251 kg. compared with 24,558; formic acid, 76,787 kg. compared with 134,702.

Color manufacture—drying stove

PHOTOREFLEX STUDIO, EMERY, BIRD THAYER D G. CO

BORN in Warrensburg, Mo., in 1889, **E. R. Foster** attended the public schools of Warrensburg and graduated from the Warrensburg normal school in 1909. Later this institution became a four-year college, and he received the degree of B.S. in education from it. From five years as chemistry teacher and principal of Nevada, Mo., high school, Mr. Foster went to Chicago University for one year. The next year he began the first of 26 years of service in the Chemistry Department at Central Missouri State Teachers' College, Warrensburg, where he is now associate professor of chemistry. This service was interrupted only once when in 1926 he did graduate work and served as assistant instructor in the University of Kansas Chemistry Department. Mr. Foster holds a master's degree from Kansas, having made a study of 1,000 of his own students over a period of years as a thesis. His records today show that he has given over 22,000 student credit hours of fundamental college chemistry in his classes since 1915.

Kansas University is a stronghold for the AMERICAN CHEMICAL SOCIETY, and it was there that Mr. Foster became a full member. He has served on committees for the SOCIETY and has been on the Senate of Division of Chemical Education. In 1941 he was chairman of the Chemistry Section of the Missouri Academy of Science. In 1940 and 1941 he helped revise the state course of study in chemistry as a member of the Chemistry Committee appointed by the State Education Department of Missouri, and was asked to assist in the chemistry examinations for the Examining Board of the Merit System in the State of Missouri. Mr. Foster has been active in civic work and has served a number of local organizations in an official capacity.

The local golf club claims him as a former president and champion in various years. He is author and proud possessor of two holes-in-one. Other top-ranking recreations are hunting and fishing. His hobby is archeology, and he has a large collection of Indian artifacts taken by his own searching in Missouri near Warrensburg.

Robert T. Foster was born in 1914 and reared in Warrensburg also. After receiving his diploma from Warrensburg high school in 1931, he attended Central Missouri State Teachers College—selected because of its convenient location in Warrensburg and because that's where his father teaches. He had decided to major in chemistry.

Robert graduated from college with an A.B. in foreign language and a B.S. in chemistry in June 1935. In August 1936 he added to the list his B.S. in education from the same institution. While in college he found time for several extra-curricular activities, including editor-in-chief of the college yearbook, athletic manager, and member of the golf team.

In 1936 Robert secured a position as a chemist for the Cook Paint and Varnish Co., Kansas City, Mo., a job doomed to be a short one because by May of 1937 he had joined the State Board of Health of Missouri as a chemist and bacteriologist. In the fall of 1937, he obtained a scholarship for graduate study at the University of Michigan, receiving the master of science degree there.

Robert returned to the State Board of Health of Missouri, where he serves at the present time. In 1940 he was made director of the State Board of Health District Laboratory, Springfield, Mo. This laboratory, with a personnel of eight assistants and technicians, is running approximately 4,000 tests a month of a chemical and bacteriological nature.

Robert is a very new A. C. S. member. He secured his required amount of practical experience four months ago and, immediately upon becoming eligible, applied for membership.

Robert and his father have been closely associated in school and recreation, and now they find another common interest in the AMERICAN CHEMICAL SOCIETY.

Missouri's Fosters

Brooklyn Poly Sets Up Paint Research Fellowship

A RESEARCH fellowship in paint technology, the Joseph J. Mattiello Fellowship, has been established in the Department of Chemistry, Brooklyn Polytechnic Institute. Funds to maintain the fellowship, which has been assigned to Sidney Siggio, a graduate of Queens College, will be provided by royalties accruing from sales of the first volume of "Protective and Decorative Coatings", prepared by a staff of chemical specialists under the editorship of Dr. Mattiello. The more than 30 collaborators on the volume have waived their royalties to support the fellowship.

Haverford Shortens Time Needed for Degree

TO PERMIT its undergraduates to complete their work for the bachelor's degree before being drafted into the military service, Haverford College, Haverford, Penna., has instituted an accelerated course which begins operation this year. By attending for two summer terms and three regular terms a student may meet the degree requirements. In the summer term, which will run for ten weeks from June 22, a man may take one full-year course and one half-year course. On petition he may be allowed to take two full-year courses. Courses in chemistry will include full-year courses in elementary chemistry, quantitative analysis, and organic chemistry, and half-year courses in organic preparations and chemical thermodynamics.

Cooperative Chemistry Test Announced

THE Committee of Examinations and Tests, Division of Chemical Education, AMERICAN CHEMICAL SOCIETY, has announced that the 1942 cooperative chemistry test will be available by April 1. Inquiries should be addressed to the Cooperative Test Service, 15 Amsterdam Ave., New York, N. Y.

The accumulation of data and experience of the past six years have modified the concept of what a test should measure and how this should be accomplished. As a result of a conference held at the University of Chicago last June, the 1942 form of the test is considerably different from those of the past four years.

On the committee sponsoring this test are B. Clifford Hendricks, Rufus D. Read, Ed. F. Degering, Laurence S. Foster, Earl W. Phelan, Theodore A. Ashford, and Otto M. Smith, Chairman.

(1) The assembly of Ignitron anode plates is shown in these three stages. Starting from the left to right, the porcelain subassembly has been properly located in place and the three insulating bushings that support the shield are positioned. Next the shield support and the thermal baffles along with the anode head are added, and last the graphite basket shield is fastened on with a simple spotlight tight clamp. (2) Two 400-kw., 575-volt Ignitron rectifiers supply power to a coal mine in West Virginia. The ease of maintenance and the short-time overloads give them an advantage over rotary converters. (3) Power for aluminum production is supplied by this line of Ignitrons, the total rating of which is 60,000 amp. at 645 volts direct current. (4) Half of a 1,000-kw., 250-volt Ignitron rectifier which is installed in a large steel mill.

Ignitron Rectifiers

IGNITRON rectifiers, manufactured by the Westinghouse Electric and Manufacturing Co., East Pittsburgh, Penna., are being installed at an increasing rate in the electrochemical industry to help turn out the vast quantities of aluminum, magnesium, zinc, chlorine, and other chemicals needed in the war program. During the past 15 months 170 ignitrons, having a capacity of 500,000 kilowatts, have been installed in the United States and Canada. The company has orders for 270 more units which will add another 800,000 kilowatts of direct-current power to the Nation's supply. This progress, made since 1938 when the first commercial ignitron for a chemical plant was installed in the Buffalo Electro-Chemical Co. for the manufacture of hydrogen peroxide, is attributed to the advantages of the ignitron in supplying continuous current without interruption. For such service the much lower arc drop of the ignitron rectifier gives it a distinct advantage over the conventional grid-controlled rectifier.

The ignitron rectifier consists of a gas-tight steel container in which there is an anode of graphite and a cathode of mercury. The principle provides a method of reliably starting an arc in a few microseconds and is based on the fact that current passed between high- and low-resistance materials in contact sets up a gradient at the junction sufficient to create a cathode spot. Once the cathode spot is started, the anode will pick up the current if it is positive with respect to the cathode. The arc will be extinguished as the anode becomes negative, and will not carry current until the next positive half cycle, when the cathode spot is re-established by the next synchronously timed impulse.

During the extinguishing period the anode is surrounded by a deionized gas, as it is bearing a reverse voltage. To counteract the influence of other anodes while

they are conducting current, each anode and cathode must be mounted in a separate chamber, and this construction permits the installation of a minimum of shields and grids—enough only to care for the transition period. This allows the anode to be close to the cathode, guaranteeing a low arc drop.

Rectification does not depend on either the gas or electrode materials. Mercury, however, is peculiarly suitable for the cathode for it has the right density for the required conductivity and insulation strength. The vaporized mercury provides the path for current flow, condenses, and flows back to the cathode pool. The anode is graphite and withstands operating temperatures better than other available materials. Because it does not melt but vaporizes directly, it withstands arc backs with negligible injury.

Occasionally a cathode spot will spontaneously appear on an anode when it is bearing reverse voltage and should be maintaining its high resistance to reverse current. When this happens, a reverse current will flow. This is the phenomenon known as arc back. Once formed, a cathode spot on the anode will maintain itself as long as current is conducted to it, and the rupturing of this current requires the opening of protective circuit breakers.

In the multianode tank rectifier, in which the arc is maintained in the chamber continuously, it is necessary to use grids, shields, and baffles to guard against arc back. Considerable separation of the anode and cathode is required for this, as well as for mechanical reasons. The shields, grids, and electrode separation increase arc drop, the amount of increase being proportional to the extent to which arc back is minimized. Elimination of the source of ionization in the ignitron during the period when the anode must withstand high reverse voltage removes the major condition which is favorable to arc back. Elimination of the chief cause of arc back makes it possible to reduce the anode-cathode spacing and the amount of shielding and griding. This is done in the ignitron with substantial decrease in arc drop and consequent gain in efficiency.

Robert E. Divine Retires

ROBERT E. DIVINE, one of the oldest active members in the Western New York Section of the AMERICAN CHEMICAL SOCIETY, voluntarily retired March 1, after some 52 years of active service in the chemical profession. For a number of years he has been associated with the Hooker Electrochemical Co. as a member of the Research and Development Department. Mr. Divine was one of those few chemists who, in the early 1900's, formed what was then the Buffalo Section of the A. C. S. Although in recent years he has been active in the American Society for

JANE HARDCASTLE

Robert E. Divine

Testing Materials and American Oil Chemists' Society, his chief devotion has been to the AMERICAN CHEMICAL SOCIETY in which he has served continuously on the Soap Committee since before World War I, as well as on the Glycerine Committee. He was also the first chemist employed by the Larkin Co., where he headed their technical work for eight years.

Taylor Receives Longstaff Medal

Hugh S. Taylor

THE Longstaff Medal of the Chemical Society of London has been awarded to Hugh S. Taylor, chairman of the Department of Chemistry, Princeton University. The medal is conferred every three years upon a fellow of the society "who, in the opinion of the council, has done the most to promote the science of chemistry by research". It is the highest honor the society's council can bestow on a fellow.

Dr. Taylor, who is the David B. Jones Professor of Chemistry, received the Nichols Medal of the AMERICAN CHEMICAL SOCIETY in 1928.

Hass to Deliver Priestley Lectures

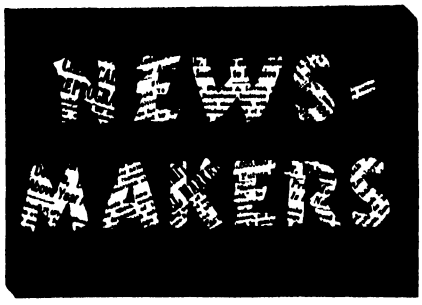
H. B. HASS, head of the Department of Chemistry at Purdue University, will deliver the 16th annual series of Priestley Lectures at The Pennsylvania State College, March 16 to 20. This series of five lectures, presented as a memorial to Joseph Priestley by the faculty of The Pennsylvania State College and the local chapter of Phi Lambda Upsilon, was established in 1926.

Dr. Hass, who is a world authority on the nitration and chlorination of the paraffin hydrocarbons, will speak on "Synthesis from Aliphatic Hydrocarbons". His work in this field has been to a large extent responsible for the rapid and important industrial development and production of the chloro- and nitroparaffins. In his lectures he will discuss "Function of Research in the University", "The Nitroparaffins", "Reactions of the Aliphatic Nitro Compounds", "Chlorination of Hydrocarbons", and "Chlorinolysis and Other Reactions of the Chloro-Paraffins".

H. B. Hass

Complete duplicate copies of the lectures may be obtained at $1.00 per copy by application to John P. Wilkins, Department of Chemistry, The Pennsylvania State College, State College, Penna.

Swift Gives Grants to Chicago and Texas



THE University of Chicago has received from Swift & Co., Chicago, a grant for 1942, to be used for studies on diet in relation to health and longevity, under the direction of A. J. Carlson, emeritus professor of physiology. Until his recent retirement, Dr. Carlson was Frank P. Hixon Professor and chairman of the Department of Physiology, University of Chicago. He purposes to study the growth and length of life of rats fed various levels of food intake of diets containing either animal or vegetable protein and various types of fat.

The University of Texas has also received a grant from Swift for 1942, to be used for fundamental studies of new nutrition factors in meats. This work will be under the direction of Roger J. Williams, who has recently been named a joint recipient, along with his brother, Robert R. Williams, of the Charles Frederick Chandler Medal of Columbia University, award in chemistry. Dr. Williams is known for his discovery of pantothenic

acid and for his work on other members of the vitamin B-complex, chiefly inositol, biotin, pyridoxin, and folic acid, in their relation to yeast nutrition.

Mrs. John J. Bruff, better known to many as Eleanor, after serving as a member of the staff of *Industrial and Engineering Chemistry* since February 1925, yielded to the demands of home duties and retired from the organization on March 1. Eleanor has been a very valuable and hard-working assistant and she will be greatly missed.

Myron Bakst has been transferred from the Federal Telegraph Co., where he was employed as a chemical engineer, to the Intelin Division of the International Telephone & Radio Manufacturing Corp., East Newark, N. J., where the work deals with chemical engineering application and coordination between laboratory, pilot plant, and production in the field of resins.

Esther L. Batchelder has left her position as director of home economics at the Rhode Island State College to become chief of the Division of Foods and Nutrition, Bureau of Home Economics, Washington, D. C.

Ronald F. Brown, recently instructor in chemistry at Purdue University, now is an assistant professor of organic chemistry at the University of Southern California.

M. E. Carlisle has been appointed general purchasing agent of the Pittsburgh Plate Glass Co., Pittsburgh, succeeding **J. A. Bechtel** who is retiring as head of the Purchasing Department after 50 years of service with the company. **Homer M. Hoffman** becomes purchasing agent of the Glass Division, and **E. J. Peters** purchasing agent of the Paint Division.

Edwin L. Dennis, chief combustion engineer of the Coppus Engineering Corp., Worcester, Mass., has been relieved of his duties as instructor at Louisiana State University at his own request. He will devote his full energies to the increasingly vital problem of efficient combustion in industrial plants.

Kenneth A. Mack

Kenneth A. Mack, formerly chief chemist and chemical engineer for Baker-Perkins, Inc., Saginaw, Mich., is commandant of the 437 Ordnance Company (Avn. Bomb.) and station Ordnance officer of Midland Army Flying School. Captain Mack is a graduate of the University of Michigan and the officer's aviation Ordnance course at Aberdeen Proving Grounds, Md.

At the annual meeting of the stockholders of the Rumford Chemical Works, Rumford, R. I., **A. E. Marshall,** president, was elected chairman of the board.

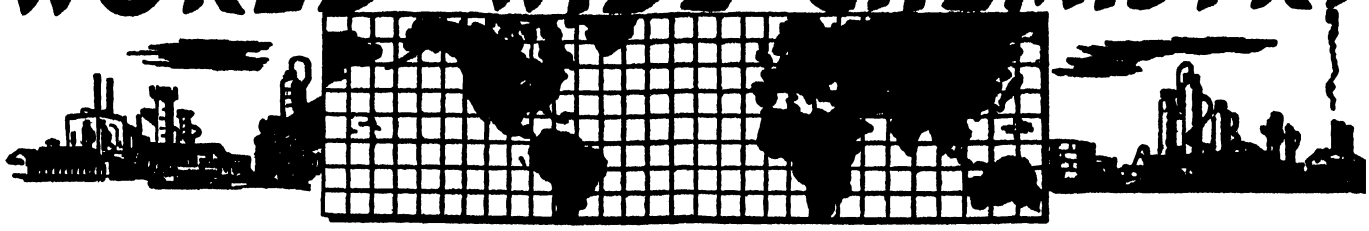
Charles L. Parsons, Secretary of the AMERICAN CHEMICAL SOCIETY, was elected a corresponding member of the Sociedad Colombiana de Quimicos at its February 10 meeting.

T. E. Schneider, for many years sales manager of the chemical division of International Minerals & Chemical Corp., formerly International Agricultural Corp., has resigned following his purchase of the detergent products division of the company's business. Mr. Schneider's new company, known as the Tesco Chemical Co., Atlanta, Ga., is manufacturing cleaning specialties, vegetable oil soaps, soap powders, and disinfectants.

Charles V. Seiler has joined the research and development staff of the Bakelite Corp., New York. Mr. Seiler received his science degree recently from Brooklyn College.

Elmer J. Weis, former aircraft parts manager, has been made vice president of the Pacific Pump Works, Huntington, Calif. Mr. Weis originated and has been responsible for the operation and supervision of the company's aviation hydraulic actuating assemblies division.

Mathieson Right to Oyster-Shell Burning Process Upheld



AN ASSERTED monopoly of the right to burn oyster shells in rotary kilns, for the purpose of making high-test carbon dioxide and lime, has been broken, according to an announcement of the Mathieson Alkali Works, New York. On February 9 the Supreme Court of the United States refused to review the decision of the Circuit Court of Appeals for the Fifth Circuit in the case of W. D. Haden Co. *vs.* Mathieson Alkali Works, Inc., which was favorable to Mr. Allen's company. The W. D. Haden Co., of Houston, Tex., asserted a broad monopoly of this shell burning process on the basis of U. S. Patent 1,896,403, and selected Mathieson as the point of attack to establish this monopoly because the company burns oyster shells at its Lake Charles, La., plant.

The crushing of the shell before calcining is an essential part of the process covered by this patent, as was determined in both the U. S. District Court for the Western District of Louisiana and the Circuit Court of Appeals for the Fifth Circuit. However, it was shown that Mathieson washes shells as dredged from the reefs and subjects them to no crushing treatment before calcining in rotary kilns of special design. The Mathieson process, therefore, according to the decision of the lower courts which has now been approved by the Supreme Court, does not violate the Haden patent.

Rubber Industry Seeks Technicians

GOOD chemists, engineers, and supervisory personnel are needed by the rubber manufacturing industry. This present shortage in technical and management men will probably be extended to the bottom classifications of labor by midsummer. War goods output, it is said, will more than take up the slack caused by an end to tire manufacture. The tire companies have not laid off workers but instead have cut the length of the work week to 30 and in some cases 24 hours, pending the expansion of arms production. In another three or four months the rubber industry is expected to be back to the 36-hour week.

WORLD-WIDE CHEMISTRY

Although no outstanding changes are reported from British chemical markets, the system of control gradually gains ground. Following tin, cadmium, and antimony under commodity control is nickel, whose buyers now need separate licenses. Control of molybdenum and tungsten metal, except in sintered or powdered form, has been transferred from the Ministry of Supply to the Ministry of Aircraft Production. An association of importers and distributors of arsenic has been formed. It will allocate all supplies for distribution on a quota basis. A recently formed asbestine importers' association will act as agents for distribution to approved users of this material, which is imported by the Ministry of Supply.

Pressure for Fertilizer Supplies Continues Unabated

Evidence that chemical supplies from the United States are reaching the British market is increasing. Large arrivals of triple superphosphates, however, were absorbed in record time and left the market for phosphatic fertilizers very much where it was. Ground phosphate is not available at present. Such quantities of other phosphatic manure as are produced in England are very quickly taken up by farmers who wish to complete fertilizing at the earliest possible moment. As for potash, supplies have improved a little so that the strict economies in consumption have been somewhat modified. Small quantities of potash salts have been provided for nonpriority crops in certain localities. Chilean potash nitrate with 15 per cent each of nitrogen and K_2O is distributed for vegetable crops. The government sponsorship of lime application has raised consumption to levels so high that factories find it difficult to meet the demand. In July to December 1941 deliveries were 40 per cent above the preceding year. Additional sources have been opened up, particularly use of waste and ground lime. More factories also have been set up by the government, although labor is difficult to provide. Deliveries of ammonium sulfate will be 30 per cent over the 1940–41 figure when the current season is ended, it is estimated.

A new outlet for chemical products in British agriculture is iodized mineral feeding supplements, given to offset the shortcomings of straw pulp and silage.

Refractory Insulating Material Improved

Improved refractory insulating material can be obtained if the highly porous grog of fine texture produced by firing mixtures of pulverized coal and fire clay is bonded with additional clay and coal and shaped by the dry-press process. By development of the process, full-size refractory insulating bricks having a relatively dense and slag-resisting face have been produced by the Refractory Materials Joint Committee of the Gas Research Board and the British Refractories Research Association. The physical properties of a dry-pressed, grogged, clay insulating firebrick—firing shrinkage, permeability, apparent porosity, bulk density, and cold-rushing strength—change roughly in proportion to the distance from the face receiving the pressure, leaving a medium layer of less compact texture than the surface in the pressed brick.

The expansion effect of alkali chlorides on fire-clay products may have serious consequences under certain conditions, one of which is temperature. Cracks developed after exposure for several hours to a temperature of 1,000° C.

The minimum temperature at which susceptible firebricks are attacked by pure dry methane is between 600° and 700° C., and the presence of moisture in the methane may increase considerably the resistance of firebricks to disintegration at 800° C. Resistance to disintegration by pure dry methane is dependent upon the thermal history; a firebrick was rendered inert by refiring to 1,400° C., or to 1,300° C. in a reducing atmosphere, for several hours.

When coal containing chloride or hydrochloric acid is burned or carbonized, chlorine will be liberated under oxidizing conditions and, in the presence of steam, hydrochloric acid will be generated. Sodium chloride at 1,000° C. can cause the volatilization, to some extent, of certain constituents of refractory materials in a dry, inert atmosphere, free from oxygen. The chlorides of iron, aluminum, calcium, and magnesium were among the volatilized products of reaction with fire clay and silica test pieces.

Need for Intensive Operation in Coke-Oven Industry Stressed

The necessity of removing hydrogen sulfide from gas may become so general after the war that the British gas industry will have to develop processes for improved purification, with a view to the separation of other gas constituents also, according to F. Booley in a lecture before the Coke Oven Managers' Association. Ethylene will sooner or later be used to greater advantage than as a fuel. The war has brought unexpectedly large demands for certain constituents of coal tar, particularly of high-temperature tar. New uses will increase the demand as more of the coal-tar constituents become available as pure compounds.

In many cases owners of high-temperature coke-producing plants are content to sell crude by-products, and the advantage of producing a pure or refined product passes outside the industry. Unless it becomes alive to the immediate necessity for development of research, the initiative must pass to others. Collaboration between coke-oven owners would facilitate the solution of postwar problems of reconstruction. The information obtained in the past two years will make possible improvements in new and rebuilt plants after the war which, under normal conditions, might have taken 20 years to become standard practice.

Mr. Booley's remarks indicate the present viewpoint of a large section of the British chemical and allied industries. The tendency in research is generally toward concentration of effort and exchange of experience for development of large-scale plans for coordinated reconstruction after the war.

Canvas Waterproofed with Chlorinated Rubber Product

A chlorinated rubber product is offered in the British market for treatment of

---

EDITOR'S NOTE. Those interested in further details should address the correspondent whose name and address appear for each country, and enclose sufficient international coupons to prepay the reply. United States stamps should not be sent.

canvas and other surfaces. The material, normally available in two colors, gray and greenish brown, is sold in the form of a spreading paste applied with a palette knife and flat scraper. The product makes the fabric completely waterproof and protects it against acids, alkalies, corrosion agents of other kinds, and atmospheric influences.

Oil-Retaining Bronze Saves Lubricating Oils

An oil-retaining bronze is being offered to British industry as a means of saving lubricating oils. Bearings made from this material contain 88.0 per cent copper, 9.7 per cent tin, and 1.4 per cent graphite. Manufacture by die pressing, leaves spaces between the metal particles which on immersion absorb oil to the extent of 25 to 30 per cent of the volume of the bearings. It is claimed that the resulting oil film on the surface is sufficient for smooth running without further lubrication over several years.

Powder Metallurgy Research Progresses

The mixture of graphite and copper used in the above and other oilless bearings cannot be obtained by fusion mixing, since the graphite will float on the molten copper. Powder metallurgy, which has made great progress in Great Britain during the past year, is also used for the alloy of copper and tungsten required for electrical contacts and for the preparation of collector brushes for generators from flake copper powder. If the molding pressure is exercised at right angles to the ultimate current flow, a selective orientation of the copper particles will result which reduces resistance in the current-flow direction. Porous nickel filter tubes, produced by the powder method, have been used in chemical works as protection against solids in liquids and gas fed to them. The new "heavy alloy" containing 90 per cent tungsten, 7.5 per cent nickel, and 2.5 per cent copper and a similar alloy consisting of tungsten and lead are also made from powders of these metals.

Synthetic Camphor Output Gains Increased Attention

In view of events in the Far East, much satisfaction is expressed in Great Britain that the country has a synthetic camphor production and is largely independent of the monopoly for the natural product. The so-called camphor substitutes, camphor equivalents in cellulose acetate plastics, are still a center of trouble, particularly so far as the alkyd phthalates and aryl phosphates are concerned. This branch of the industry, reports V. E. Yarsley, has done remarkably well during the past year in making up for formerly imported supplies and at the same time coping with a rapidly increasing demand.

Nine Thousand Molds Used for Plastic Lenses

It is estimated that 9,000 different molds are being prepared from which it should be possible to fit every pair of eyes in the services with plastic lenses. Thermoplastic sheet is also used in the army in the treatment of wounds; the new molded plastic "cast window" enables the doctor to peer into the wound without cumbersome trouble with bandages.

Locations of Vegetable Oil Industry Decentralized

Acquisition, use, treatment, disposal, and consumption of paint, lacquer, and varnish containing tung oil, oiticica oil, stillingia oil, drying oil made from castor oil, or thickened or mixed oil in which any of these oils is an ingredient, has been prohibited except by license, which will be granted for war purposes only. This measure stresses the need for economics in the consumption of vegetable oils, also emphasized by the reduction of the butter and margarine ration from 8 to 6 ounces a week.

The English oil extraction industry has changed considerably since the outbreak of war. Originally concentrated in some ports on the east coast which have been frequently visited by enemy bombers, the industry is now dispersed to many different places. Production has not suffered. Opportunities to build up reserves have, it is believed, been taken and good stocks of edible and technical oils are on hand. The addition of vitamin D to margarine has been doubled. Good allocations are being made to soapmakers. Demand for certain oils for lubrication is steady. As vegetable oils and raw materials for oil extraction take up a large amount of shipping space, there seems to be scope for an international arrangement in this field.

Netherlands Indies Iron Sulfate Imports Increase

Imports by the Netherlands Indies of iron sulfate were 132 metric tons in 1940, compared to only 3 tons in 1939 and 7 in 1938, according to a trade survey. A domestic plant at Surabaya manufactures carbon disulfide and sulfuric acid, stocks of which are consumed largely in the batik industry and include both domestic and imported amounts as required.

Guano Fertilizer Demand in South Africa Exceeds Supply

Demand for guano fertilizer among South African agriculturists is approximately five times the supply annually, with the government distributing this natural product after gathering it from publicly owned islands around the coast. Efforts are being made to raise the production to 10,000 tons annually, by protecting the nesting areas of the guano-producing birds.

The price for the forthcoming allotment of guano, April 1942, will be approximately $24 per short ton, or approximately $2.40 per 200 pounds, delivered packed in bags. This is the minimum quantity supplied. The major demand is from wheat growers in the western part of the Cape Province.

Imports to Chile of Sodium Hydroxide Gain

Chilean imports of sodium hydroxide continue to increase, according to the U. S. Department of Commerce, despite an annual production of 1,500 to 2,000 metric tons. Imports in 1939, with the United States and Great Britain as the principal suppliers, were 2,358 tons, compared to 1,652 tons in 1937. In 1939 the British share of the market was 1,354 metric tons to 952 from the United States. Prior to the war Germany, Japan, and Sweden participated in the trade in small amounts.

Brazil Exports Bone Meal, Animal Fertilizers

Brazil is a source of bone meal, other animal fertilizers, cottonseed cake, and cottonseed bran, according to a digest of such exports showing that the country's large packing houses shipped abroad 10,127,460 kg. of bone meal and similar products between January and October 1941. Cottonseed cake shipments through the crop year March-September were 3,270,000 kg. and cottonseed bran, 10,999,806 kg.

Guatemala Experiments with Derris Production

Experimental production of derris is reported from Guatemala. The principal grower has attained a production of 200 pounds and is said to be working on the problem of increasing the rotenone content of the output. The cuttings in general use are the Philippine variety, having a low rotenone content.

A dip of nearly 50 per cent in Chilean exports of carpenters' glue is indicated in government statistics showing that such exports were 103,200 kg. in the first eight months of 1941 against 202,800 in the same period for 1940.

. . . addressed to the men
who are putting resins
to work for victory

HERCULES
Designer of Resins for Industry

Have you any problems in which new kinds of resins—resins with out-of-the-ordinary properties—can be useful?

You already know our phenolics and maleics. They have been sold for years under the Lewisol name. You also know our ester gums, under the Imperial Brand name.

The other Hercules Rosin Esters—with a wider range of properties—some of them extremely useful under today's constantly changing conditions—are not as well known. On these we have a large backlog of technical data, ready to turn loose on your problems with a minimum of time-consuming development work.

Among these resins are the three Pentalyns*—pale, hard, heat-stable pentaerythritol esters of rosin—valuable because they can be cooked to full body with the softer oils *without discoloration or decomposition*. Hercolyn* and Abalyn*, too, are very important today—two *liquid resins*, the methyl esters of rosin—widely used as resin plasticizers, solvents, pigment-grinding aids, and modifiers for blown asphalt. There are special ester gums from Staybelite* (Hercules' hydrogenated rosin), ranging from very viscous liquid resin-plasticizers to *balsams* or brittle solids—and Vinsol* Ester Gum—hard, high-melting, solvent-resistant. New and challenging is Poly-pale* Ester Gum—higher-melting and with a heavier body than gum esters.

These and the other Hercules Rosin Esters will bear investigating. Many can be put to work right away—using already-available data to help you get started faster on your own part in the victory drive. Hercules is still designing resins for tomorrow—improved over anything known today. But before that "tomorrow" can be realized, before industry can set forth to win the peace with these new tools, there's a war to be won. If Hercules resins can help, we want them used. Call on us for specific suggestions on your war-production problems. Technical data and samples will come to you immediately, without obligation.

POTOMAC POSTSCRIPTS

Allocations and WPB Actions

Aluminum and Magnesium. Programs for the production of 2,000,000,000 pounds of aluminum and imports of 450,000,000 pounds from Canada and for output of 725,000,000 pounds of magnesium annually have been announced by W. L. Batt, director of materials of the War Production Board. By May 1942 American plants will be turning out aluminum at between three and four times the rate of the best peacetime year, 1937, when production was around 300,000,000 pounds, and by the end of 1942 will reach the rate of 1,450,000,000 pounds.

Current production of magnesium is at the rate of about 60,000,000 pounds and by midsummer will be between 200,000,000 and 250,000,000 pounds per year. The Dow Chemical Co. is to build a plant in Michigan to make an additional 144,000,000 pounds of magnesium annually from new salt brine wells containing three times as much magnesium as the wells at Midland, Mich. Including the plant now producing magnesium from sea water in Texas and another Texas plant now in construction, which will be operating by early summer, Dow will be producing about 270,000,000 pounds, or over a third of the whole program.

The ferrosilicon process, developed by the Union Carbide & Carbon Corp., Ford Motor Co., and Dominion Magnesium Co. in Canada, will produce about 157,000,000 pounds annually. Work has already been started on three plants, which are expected to be in operation in less than six months. By the fall of 1942 plants producing magnesium by other processes are expected to be producing 96,000,000 pounds annually, and experimental pilot plants are working on the reduction of olivine.

Cellophane. A 30-day extension on Limitation Order L-20, relating to cellophane, was ordered February 16 by the Director of Industry Operations, WPB. Studies of cellophane uses are being made and either a further extension of L-20 or an order to replace it will be issued at the end of the 30 days.

Chlorinated Rubber. All stocks of chlorinated rubber in the United States, except those going into a specified use, have been ordered frozen, preparatory to requisitioning by the War Production Board or diversion into war production.

An amendment to General Preference Order M-46 provides that chlorinated rubber may be used only as a paint for interior use in industrial plants where resistance to chemical corrosion is necessary; as a paint in arsenals and for ship bottoms and other submarine uses; for flameproofing military fabrics, including tents; for tracer bullets; for adhering rubber articles to metal; and for electrical insulation. Stocks on hand for all other uses must be reported at once to the Chemicals Branch, WPB, and held for later disposition.

Although facilities for production of chlorinated rubber are being increased greatly, current military demands are much in excess of supply. The material has been under a monthly allocation system since November 1, and none is now going for nonmilitary use.

Principal civilian uses for chlorinated rubber which are prohibited by the order are swimming pool paint and other concrete and masonry paint; treatment of fabrics, papers, and printing inks for greaseproofing and to increase resistance to chemical action; bottle cap closures; and fast drying paint finishes.

Glycerol. Major producers of liquid and potash soap will be directed to process their fats and oils to obtain the maximum amount of glycerol from their production, WPB has announced. Smaller companies, however, may not be required to effect a complete recovery of the glycerol in their products because of the relatively small amount involved and the excessive cost of getting it.

Phenol and Anhydrous Ammonia. Substantially increased capacity for the production of phenol and anhydrous ammonia was called for by the Requirements Committee of WPB at its first meeting. The increased capacity, William L. Batt, chairman of the committee, said, was found to be necessary to meet requirements of the greatly expanded military program. Appropriate federal agencies, he said, will immediately take the necessary steps to carry out the committee's determinations.

Tungsten. Further conservation of tungsten, vital in alloy steel, has been ordered in Conservation Order M-29-b. This regulation prohibits use of tungsten in grinding wheels and gages and as a coloring material for rubber, linoleum, paper, or other similar materials after May 1. Until that date use of tungsten in these items is limited to 17.5 per cent of the amount used during the year ended June 30, 1941.

All other tungsten users, except those specifically exempted, must reduce their use between February 1 and March 31 to 12 per cent of the amount used in the year ended June 30, 1941. After April 1 they are limited by calendar quarters to 17.5 per cent of the amount used in the base year.

Exemptions include use of tungsten for Army, Navy, Lend-Lease and other government contracts; to comply with safety regulations; orders bearing preference ratings of A-1-j or higher; corrosion-resisting material; alloy steels; hard-facing materials; hard-cutting tools and tool tips; atomic hydrogen welding rods; laboratory reagents and pharmaceuticals; laboratory research equipment; electrical equipment; radio and x-ray equipment; and electronic relays and electric lighting uses, both filament and fluorescent.

Price Regulations

Fertilizer. Price control action designed to aid the American farmer in his all-out food production campaign have been taken by Price Administrator Leon Henderson in the form of a freeze of fertilizer prices, a major item of cost to farmers, on the eve of spring planting. This order, Temporary Maximum Price Regulation No. 1, forbids the retail sale of mixed fertilizer, superphosphate, and potash on and after February 27 at prices above those at which any seller of fertilizer at retail did business during the five-day period from February 16 through February 20. This temporary regulation has a life of 60 days from February 22, but on or before its expiration will be supplanted by a permanent regulation.

Fertilizer sales down to a minimum of 250 pounds are covered. OPA will scrutinize all such small lot sales with extreme care for possible evasions. Some 75Q mixers will be affected by the fertilizer order. In 1940 the industry produced 8,310,853 tons.

Paraffin Wax. Letters have been sent to exporters of paraffin wax notifying them not to buy from producers or jobbers at prices in excess of those allowed under Price Schedule No. 42 for ordinary domestic sales. This is in accordance with the terms of the schedule establishing one set of ceiling prices for all sales made within this country either to domestic consumers or exporters and another somewhat higher set of prices for export sales to persons in foreign countries and for export sales to persons in the territories or possessions of the United States.

OPA has received reports that some producers and jobbers have been offering wax to exporters at the higher ceilings applicable only to sales to individuals or concerns outside continental United States, exclusive of Alaska. Such sales would be clearly a violation of the schedule, OPA Administrator Henderson stated.

PYROXYLIN plastics amounting to 112,944 pounds and synthetic resins valued at $46,013 at works were reported among bonding and bushing materials used by Canada in production of artificial abrasives in 1940.

Need a Solvent - Now

IMMEDIATE availability in plentiful commercial lots is one of the vitally important reasons why you profit by using Furfural. And far from sacrificing quality in your product, you may find that you are doing a better than ever solvent job at a lower cost. In bulk Furfural costs less than a dime a pound.

Write for this Free Booklet

Selective Solvent—for refining lubricating oil, wood rosin, and other substances requiring the separation of color, odorous material, unsaturates or foreign bodies from the primary substance.

Resin Solvent—for the production of resin bonded abrasive articles where Furfural is the solvent, wetting agent, and plasticizer used in the forming stage, after which the products are baked to form hard dense structures.

General Solvent—for use in dispersing nitrocellulose, cellulose acetate, dissolving paint and varnish films and many other substances.

The uses of Furfural are not limited to solvent applications for it is used in many other ways. In resin manufacture it finds increasingly important application. Consider it also as a penetrant, preservative, fungicide and chemical intermediate.

Ask for a copy of our free booklet entitled "The Furans," which contains information about Furfural, its uses and its derivatives.

Indiana Standard to Build Toluene Plant

THE Standard Oil Co. of Indiana has concluded a contract with the Government to build and operate a toluene plant at its refinery in Whiting, Ind. This one plant will produce as much as the total annual output of toluene in the United States in World War I. Construction will be started as soon as details can be arranged and necessary materials obtained. It is anticipated that more than a year will be required to build the plant.

Standard is negotiating with the Government concerning erection of an alkylation and butane isomerization plant at Whiting to increase its output of 100-octane aviation gasoline. Existing facilities at the Whiting refinery, already operating at capacity, are supplying large amounts of aviation gasoline. Since the quantities of aviation fuel required for the Nation's war program far exceed the possible output of existing capacity in the whole industry, additional plants must be built.

New WPB Section Studies Chemical Plant Facilities

IN THE Chemical Branch, Material Division, War Production Board, of which E. W. Reid is chief, a Section of Plant Facilities has been set up with C. T. Thompson as chief, for the purpose of putting idle chemical equipment to work for essential chemical war needs and to aid in diverting equipment from nonessential to essential uses. The section will also act as a liaison office between principals who may be able to produce some essential product and those who may have equipment either idle or not engaged in direct war production. The new section is anxious to contact persons with idle equipment who may desire to produce some critical item and need additional equipment, as well as those wishing to divert existing production to meet some direct war demand.

The agency is concerned with existing equipment only and not with new equipment. Persons having such equipment should list and describe it, give information as to past usage, and if possible suggest other usage for which it might be adapted. They should also report whether the equipment could be used in place or would be available for relocation under some circumstances. Manufacturers are urged to make the most of this further opportunity for national service.

BOLIVIAN chemical imports showed a slight gain during 1940 with the United States and United Kingdom being the principal suppliers. Principal consumers were mines, textile mills, soap factories, tanneries, the malt liquor industry, and drug trade.

Sulfur for Defense

America's sulfur requirements in 1942 will exceed those of 1941, according to Langbourne M. Williams, Jr., president of Freeport Sulphur Co. "Fortunately," he states, "the Nation's enormous unmined reserves, large above-ground stocks and great productive capacity place us in a strong position to meet any challenge of the future." See pages 336–337.

Plastic Disks for Blackouts

PLASTIC disks about the size of a nickel, said to give maximum reflection of light from minimum candle power, are the latest contribution of science to blackouts. Reflecting sharply the light from a blackout colored flashlight or similar shaded source, the disks may be worn on belts, armlets, and clothing, or used as directional signals and signs of danger spots such as stairways and elevator shafts, the du Pont company, Wilmington, Del., reports. Made wholly of Lucite methyl methacrylate resin, each disk has a hole in the center and may be nailed, riveted, screwed, or wired in place.

The reflectors, on sale at retail stores, are injection molded for Lumelite Corp., New York, from Lucite produced by the du Pont Plastics Department.

Synthetic Methanol Production Increases

SYNTHETIC methanol production in the United States for the first 11 months of 1941 totaled more than 50,335,800 gallons, against 41,055,000 gallons for the same period of the previous year, the U. S. Bureau of the Census reports.

In January through November 1941, crude methanol output came to 5,089,500 gallons, compared to 4,810,000 in the same months of 1940. Stocks at the end of November 1941 were 1,080,300 gallons of synthetic methanol and 683,400 of the crude.

Argentina to Sell Alcohol from Corn to U. S.

A PLAN to help Argentina dispose of some of her surplus corn has been worked out by government officials responsible for obtaining industrial alcohol for the production of smokeless powder. Under a program which has won the approval of this Government and the cooperation of Argentine officials, that country will use available distilling facilities for the production of industrial alcohol from the surplus corn and ship the product to the United States.

The program will enable Argentina to convert her corn into a commodity which the United States requires for armaments and for that reason is not likely to stir up complaints from farmers in this country. Economic relations between the United States and Argentina have been complicated for years by the fact that the country's two major exports, beef and corn, are directly competitive with U. S. production.

Argentine distilling interests, it is reported, have been inquiring in United States markets for second-hand industrial alcohol distilling equipment with which to augment their own facilities. Since this country is also trying to expand its industrial alcohol output, it is doubtful if the inquiries will result in any actual sales.

U. S. Pushes Cultivation of Medicinal Plants

JUST as the last war resulted in creation of a self-contained American synthetic chemical industry, so this war is expected to result in new vegetable drug industries here and in South America. Most of the imported European drugs can be grown in the United States. Many of the Oriental drugs can be grown in either Mexico or Latin America, or else substitutes can be produced. About 30 per cent of the country's former drug supplies came from Europe and about 25 per cent from the Far East. Most of the plants grow wild. Loss of certain characteristics under cultivation raises another major problem. Cheap labor is also a factor; this is why digitalis (foxglove) which grows in most of America's backyard gardens was imported. The Department of Agriculture is advising farmers on cultivation of plants for medicinal raw materials, and an expedition under government sponsorship is going to South America to develop increased supplies.

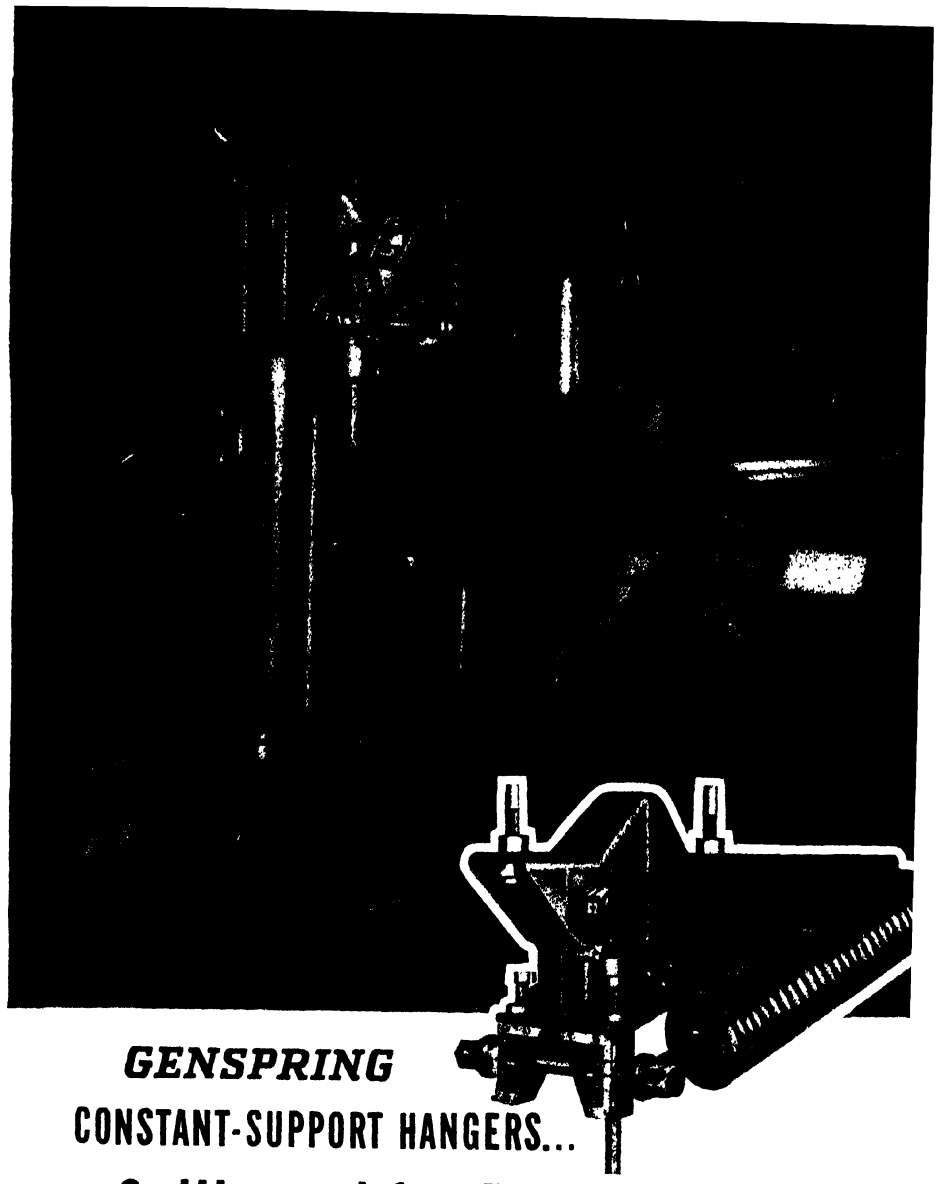
One of the vitally important jobs under way, besides finding sources of plants, is to make the alkaloid and other plant principles from the raw materials. S. B. Penick & Co., E. R. Squibb & Sons, Merck & Co., Abbott Laboratories, and Eli Lilly and Company are busy in these fields of research.

Canary Islands Must Raise Fertilizer Imports

THE Canary Islands are developing as a market for fertilizers, with reports that thousands of tons, especially nitrates, are being imported annually because of the intensified system of cultivation. Unless negotiations for a limited amount of ammonium nitrate and sodium nitrate from Chile are successful, it is said, 1942 crops in the islands may suffer materially. The Canaries export principally bananas, potatoes, tomatoes, and onion seed.

The most recent figures on fertilizer imports by the islands are for 1934 and show, in metric tons, potash fertilizers 7,113; sodium nitrate 339; synthetic nitrates 1,145; ammonium sulfate, 22,578; and superphosphates, 16,508.

British India Studies Molasses Utilization

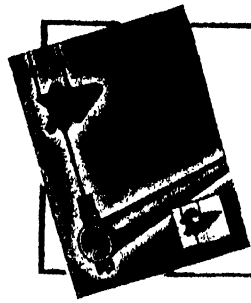


UTILIZATION of waste molasses, left after sugar crystallization, offers a problem in British India, according to reports received here which have attracted interest because of the steps being taken in the United States to conserve raw materials for alcohol production for munitions.

An accumulation of 500,000 tons annually is reported from India where research has been under way seeking to convert it to use. Power alcohol produced domestically from fermentation of molasses already has been adopted for mixture with gasoline, and compositions for road surfacing have been produced. Efforts are being directed to extraction of potassium salts and recovery of organics including citric and oxalic acids and butyl alcohol or acetone from the waste.

Shortage of Raw Materials Hits Mexican Chemical Industry

THAT the shortage of many raw materials is affecting the chemical and pharmaceutical industry of Mexico is revealed in a listing of basic needs. These are said to be acetylsalicylic acid, quinine and salts, medicinal solutions, cyanides, coal-tar dyes, olive oil, essential oils, cocoa butter, citric and tartaric acids, and ammonium sulfate. The soap and oils industry is concerned by a shortage of sodium hydroxide, essential oils and dyes, while lack of linseed oil, dyes, varnishes, hydrochloric and sulfuric acids, alum, chromium, potassium bichromate, sodium bichromate, and tanning extracts trouble the shoe and tanning industry.



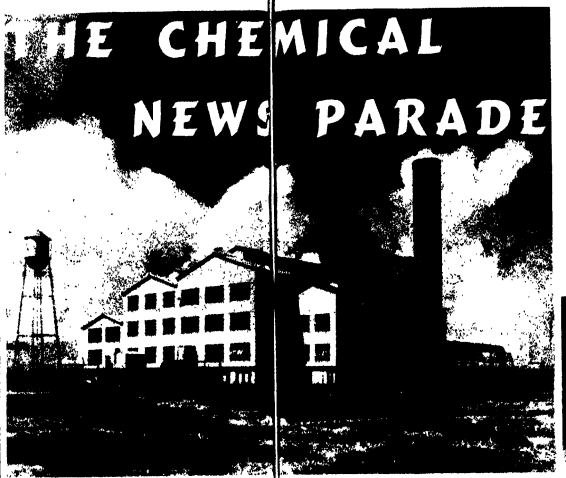
PHILIPPINE imports of chemicals and allied products during the first nine months of 1941 declined slightly to $8,991,000, compared with $9,236,700 in the same period of 1940. The bulk of these products was imported from the United States.

GENSPRING
CONSTANT-SUPPORT HANGERS...
Calibrated for Each Installation

Before shipment to you, every GENSPRING Constant-Support Hanger for power piping is *individually* tested at the factory under load-and-travel conditions that duplicate the actual service specifications. However, should you find it necessary, field adjustments up to ± 16% of the hanger's rated load are easily made.

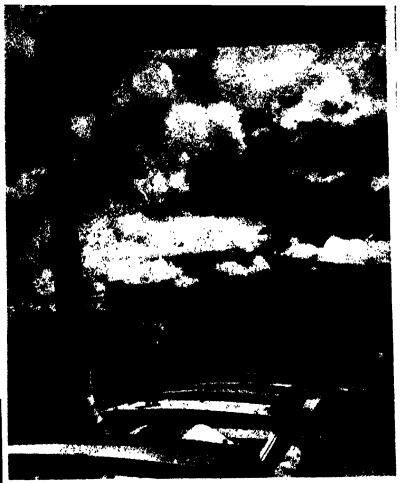
These are only two of the manufacturing and design features that make GENSPRING the outstanding hanger

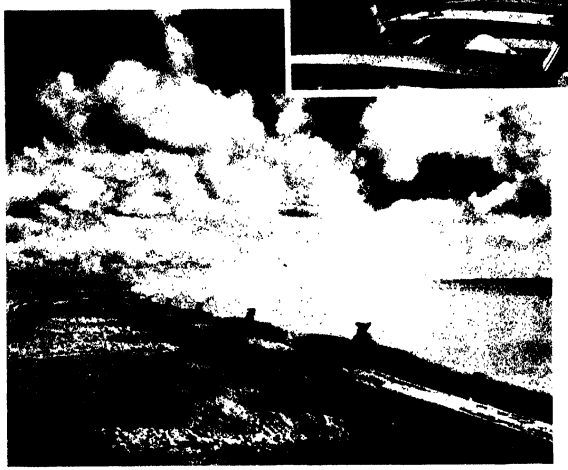
WRITE FOR complete Data Book on GENSPRING Hangers containing piping-travel calculations.



GENSPRING CONSTANT-SUPPORT HANGERS BY

Right. The power plant at Freeport Sulphur Co.'s Grande Ecaille mine in Louisiana, considered one of the world's most unusual sulfur mines because of the extremely unstable marshland on which it was developed. For the plant foundation 3,500 piles, each 75 feet long, had to be driven. They sank the first 45 feet into the Mississippi delta before being struck by pile drivers. Land around the building has been filled. *Left.* This is sulfur, a primary chemical raw material to meet mounting needs of wartime industry, shipments from the Gulf Coast sulfur mines are at an all-time high. In 1941 they rose to an estimated 3,375,000 long tons, more than 750,000 tons above the previous record.





THE CHEMICAL NEWS PARADE

Left. Sulfur shipments are made night and day from Port Sulphur, La. Despite heavy demands, the sulfur industry's large above-ground stocks of mined sulfur have been maintained with practically no reduction. These stocks now total about 4,000,000 tons. *Lower left corner.* Bank of boilers in the Grande Ecaille plant. These boilers furnish steam to help heat 3,000,000 gallons of water a day, used there in mining sulfur by the Frasch process. Superheated water at about 330° F. is forced into the underground sulfur-bearing formations to melt the sulfur, which is then extracted in molten form. *Below left.* Pumps, driven by steam turbines, pump the hot water through insulated pipes from the power plant to the sulfur wells at the mining area about a mile away. The wells consist of four concentric pipes, which keep separate the hot water, compressed air, and molten sulfur. *Below right.* Three 800-pound high-pressure air compressors supply air to the mine area for pumping the sulfur wells. Air at about 600 pounds pressure is supplied to a central relay station, from which it goes into wells at about 400 pounds pressure.

Right. On the muddy Mississippi beneath billowing clouds at Port Sulphur a barge gets its load. Sulfur mined by the Frasch process is guaranteed better than 99.5 per cent pure and free from arsenic, selenium, and tellurium. *Below.* To maintain a relatively low formation pressure, water injected into the formations must be bled from the mine—removed through special "bleed wells", piped from the mine area, and purified by aeration, as shown here, before disposal. *Lower right corner.* Dredge cuts mud from lake and bayou bottom at Grande Ecaille to fill underground cavities. About 6,750,000 cubic yards of mud have been pumped into the formations, and about 7,500,000 used for surface fill.

American Chemical Society[1]

103RD MEETING. Memphis, Tenn., April 20 to 24, 1942.

104TH MEETING. Buffalo, N. Y., September 7 to 11, 1942.

105TH MEETING. Indianapolis, Ind., spring of 1943.

106TH MEETING. Minneapolis, Minn., fall of 1943.

NATIONAL CHEMICAL EXPOSITION. Stevens Hotel, Chicago, Ill., November 17 to 22, 1942.

NINETEENTH NATIONAL COLLOID SYMPOSIUM, Division of Colloid Chemistry. University of Colorado, Boulder, Colo., June 18 to 20, 1942.

Other Scientific Societies

AMERICAN ASSOCIATION OF CEREAL CHEMISTS. Edgewater Beach Hotel, Chicago, Ill., May 18 to 22. Annual meeting.

AMERICAN CERAMIC SOCIETY. Hotel Netherland-Plaza, Cincinnati, Ohio, week of April 19. Annual meeting.

AMERICAN INSTITUTE OF CHEMICAL ENGINEERS. Boston, Mass., May 11 to 13. Semiannual meeting.

AMERICAN INSTITUTE OF ELECTRICAL ENGINEERS. Chicago, Ill., June 22 to 26.

AMERICAN INSTITUTE OF NUTRITION. Boston, Mass., April 1 and 2.

AMERICAN LEATHER CHEMISTS ASSOCIATION. Bolton Landing, Lake George, New York, N. Y., May 25 to 27.

AMERICAN SOCIETY OF BIOLOGICAL CHEMISTS. Copley-Plaza, Boston, Mass., March 31 to April 4.

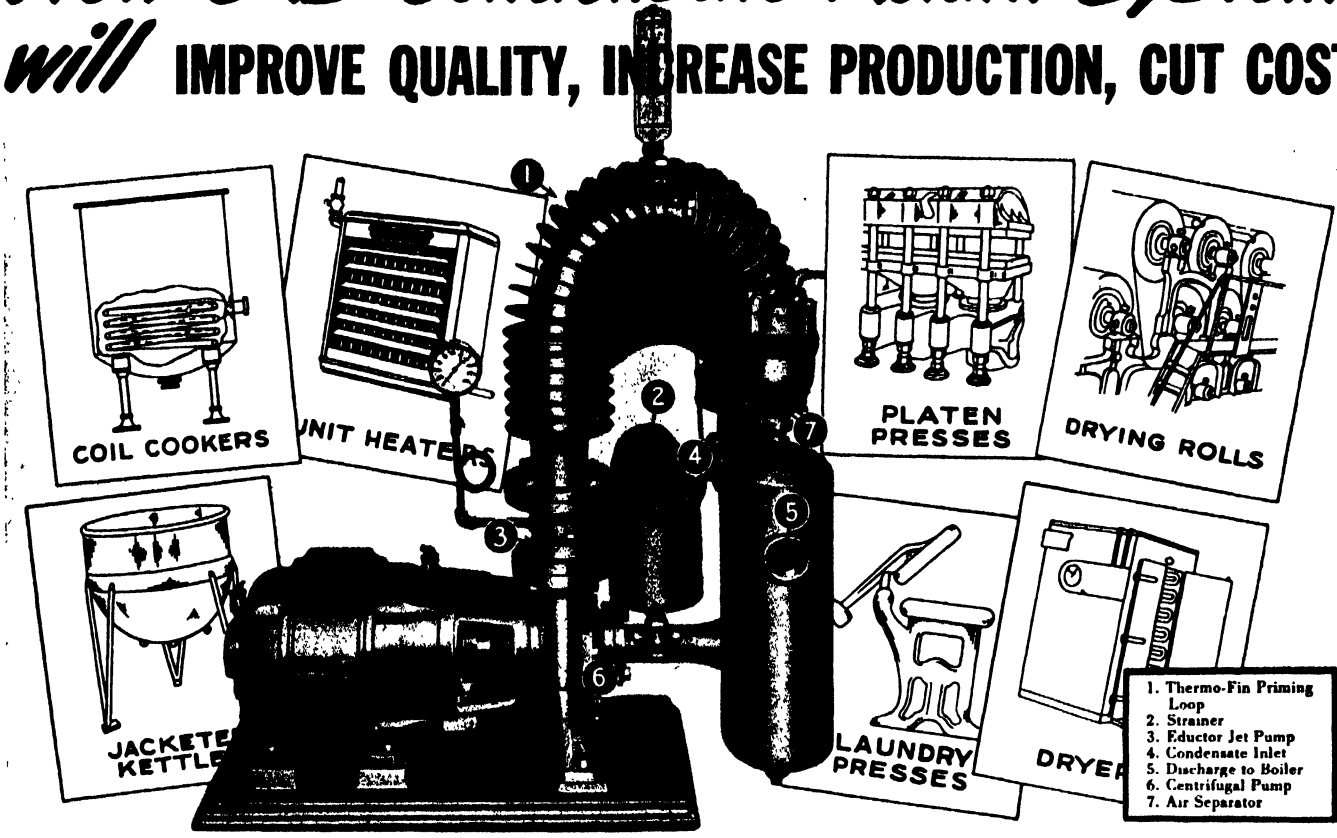
AMERICAN SOCIETY OF BREWING CHEMISTS. Netherland-Plaza Hotel, Cincinnati, Ohio, May 25 to 27.

AMERICAN SOCIETY FOR TESTING MATERIALS. Atlantic City, N. J., June 22 to 26.

ELECTROCHEMICAL SOCIETY. The Hermitage Hotel, Nashville, Tenn., April 15 to 18.

INSTITUTE OF FOOD TECHNOLOGISTS. Minneapolis, Minn., June 15 to 17.

NATIONAL PETROLEUM ASSOCIATION. Hotel Cleveland, Cleveland, Ohio, April 16 and 17. Semiannual meeting.



SCIENTIFIC APPARATUS MAKERS OF AMERICA. Hotel Hershey, Hershey, Penna., June 1 to 3.

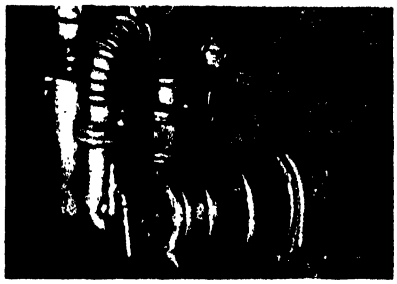
[1] The list of the SOCIETY's National Officers and Directors, Editors, members of Council, Divisional and Local Section Officers, Committees, and Chapters of Student Affiliates appears in CHEMICAL AND ENGINEERING NEWS three times a year—usually February 10, May 10, and October 10. The latest list is printed on page 187 of the February 10 issue.

New C-B Condensate Return System will IMPROVE QUALITY, INCREASE PRODUCTION, CUT COST



Rapid Positive Removal of Condensate, Elimination of Air and Return to Boiler in Process Work

Operating on the eductor principle, the new Cochrane-Becker Condensate Return System rapidly removes hot condensate from steam process equipment and returns it to the boiler at high pressure and close-to-process temperature.

The eductor action is continuously energized by a jet from a specially designed pump and given balance and continuity by a loop, forming a closed circuit to insure positive priming. An air separator completely removes entrained air and gases continuously and automatically, the condensate being returned to the boiler at maximum temperature and pressure.

Because the circuit from boiler through equipment and back to boiler is thus a closed system, there is no flash loss as in the usual open return system.

Many large corporations are using the C-B system with remarkable results. Testimonials to the savings effected are on file and will be mailed on request.

Rubber Company Speeds Production.
Saves 20% in Fuel. "Uniform temperatures maintained on presses are a big factor in the increased production we have experienced since installing this system. We also have better than 20% saving in fuel."
Pierce, Roberts Rubber Co., Trenton, N. J.

Write for Publication No. 3025, or better yet, ask us to make a survey of your steam consuming equipment, return lines, steam consumption and boiler facilities. We will estimate savings to be effected by the C-B system and submit it for your consideration.

C-B SYSTEM

Akron Rubber Group to Meet

THE Akron Rubber Group announces that its spring meeting is scheduled for March 20 at the Akron City Club, Akron, Ohio. The General Electric Co. will present its program entitled "Lamps in the Spectrum" or "Applications of Radiation from Filament and Gaseous Discharge Sources".

Big Demand for Space at National Chemical Exposition

TERMED "the most important industrial exposition of the year because of the war" is the National Chemical Exposition to be sponsored by the Chicago Section of the AMERICAN CHEMICAL SOCIETY, November 17 to 22 at the Stevens Hotel, Chicago.

More than 60 per cent of the available exhibition space, double the area of the first show held in December 1940, is already under contract with firms throughout the country. According to Victor Conquest, director of research for Armour & Co. and chairman of the show committee, the exposition will utilize the hotel's exhibition hall, which was adequate for the first show, and has contracted for one of the large ballrooms and connecting floor space. Additional exhibition space could not be secured because of the hotel's prior bookings.

Held in conjunction with the exposition this year will be a National Industrial Chemical Conference addressed by leaders in the chemical industry. Many scientific societies are planning to hold their conventions and meetings in Chicago during the same period The show and conference, said Mr. Conquest, will be a patriotic gathering of experts who hold the key to many wartime problems.

Exposition headquarters are located at 110 North Franklin St., Chicago.

Somerville Discusses Sunlight Aging

A. A. SOMERVILLE, vice president of R. T. Vanderbilt Co., discussed weather aging comprehensively at a meeting of the Chicago Rubber Group, A. C. S. Division of Rubber Chemistry, on February 5.

The talk supplemented and brought up to date a paper presented before the meeting of the division at Atlantic City, N. J., in 1929.

In testing, 15 different rubber compounds were subjected to sunlight deterioration, with the samples under stress at elongations from 5 to 50 per cent. The samples, 10-inch loops, were stressed between wooden pegs spaced at different distances on the test board. Five sets of 19 boards were used, with the sets at different locations. One set of samples, which was exposed in the midst of a group of high tension lines, behaved no differently from the others, apparently because the installation was engineered well enough to minimize the formation of free ozone. In general the results confirmed previous observations, showing that maximum deterioration in sunlight takes place at 10 per cent elongation.

Dr. Somerville also discussed other test methods. A stepped cone which was utilized in earlier work accommodates rubber bands for exposure at various elongations. In another test triangular samples are stressed and then fastened along the base and at the apex, which results in less stress at the base than at the apex. A new test machine utilizes Hoover vacuum cleaner rings which are stressed at 10 per cent elongation around rotating sheaves. This machine, in addition to providing uniform exposure for the samples, brings in another factor of deterioration, namely the effect of flexing.

Vanderbilt weather aging machine utilizing vacuum cleaner rings

New Process Introduced for Chlorinating Paper Pulp

A NEW process of bleaching paper pulp stock, which promises to reduce substantially the amount of chlorine needed for this purpose, was described in a paper presented by R. R Fuller, Gulf States Paper Corp., and G. A. Petroe, Mathieson Alkali Works, Inc., at a meeting of the Technical Association of the Pulp and Paper Industry in New York.

The basic principle of the process is to add chlorine to the pulp for bleaching purposes while the pulp is flowing through a piping system and is in a state of turbulence. This method of application, the inventors of the process state, ensures a uniform mixture of chlorine and pulp, so that the pulp is evenly treated and the chlorine is used with maximum efficiency.

An automatic system of chlorinating paper pulp that embodies the new process has been developed by the Mathieson Alkali Works and the Gulf States Paper Corp., working in conjunction. The rate of feeding the chlorine is controlled by an air-operated regulator, which varies the amount of chlorine being added in exact proportion to variations in the amount of pulp flowing through the piping system. The automatic process has been reduced to practice and is now in regular use by the Gulf States Paper Corp.

New Oils for Quick Drying Paint Developed

TWO new oils have been developed which will make it possible for the paint industry to continue the manufacture of quick drying paints and varnishes. With imports of tung oil cut off by war in the Far East, the industry, it was feared, would soon be forced to return to the manufacture of slow drying paints. The new developments, however, will make such a move unnecessary. It is even felt that they may permanently replace China wood oil in this country.

Developed by Spencer Kelloff & Sons, the new oils are known as Kellin and Kellsoy. Basically they are made from linseed oil and soybean oil to which quick hard drying qualities have been imparted by a secret process. Commercial production is getting under way, and the company plans to increase output substantially in coming months.

Most of the principal raw materials, flaxseed and soybeans, are grown in large quantities in this country. More than 50 per cent of all the flaxseed used in this country is domestically grown, with the balance imported from Argentina. All of the soybeans consumed in the United States are grown here. A satisfactory hard drying oil has been made from castor oil by chemical reconstruction of its composition. However, the raw material, castor bean, has to be imported from Brazil.

...use SIMPSON INTENSIVE MIXERS

ANOTHER processing problem finds its solution through the use of Simpson Intensive Mixers! This time it's soap, both bar stock and in powdered form. In both cases, results proved beyond question that the product was produced faster, at less cost, with a higher quality than by using former methods. Thus, Simpson Mixers, with low original cost, will efficiently and economically replace conventional amalgamators and soap mills.

Units for handling soap are equipped with 3,000 lb. mullers, to handle heavy semi-solids efficiently. With a No. 2 unit, tests show that 300 to 400 lb. batches can be turned out every 7 to 12 minutes—*using only 20 H.P.*—just a fraction of the power required with ordinary equipment. In addition, savings in coloring material and perfume are appreciable, due to the thorough distribution assured through the mulling principle of mixing.

Bar soap produced from stock blended in a Simpson Mixer withstood exhaustive washing tests without cracking or checking — ample proof of high quality. Powdered soap, now being produced in quantities with the Simpson Mixer, passes equally high tests. Write for details about Simpson Mixers to meet your needs.

• *Illustrated above is a standard No. 2 — 6 ft. diam. pan Simpson Intensive Mixer. This unit, one of the most efficient production sizes in the National line, has a capacity of 10 to 15 cu. ft. of material. Mixers of this size are being used successfully in hundreds of chemical and process industry plants to increase production, cut costs, and improve product quality.*

SIMPSON

C. S. Examinations Reannounced for Scientists

Scientists have contributed much to public welfare in peacetime. Today they have a vital part in the Nation's defense efforts. The knowledge and technical ability which chemists and physicists possess are in urgent demand in both industry and government service in solving defense problems. In an effort to meet the increasing need, the Civil Service Commission has reannounced, with modified requirements, its examinations for physicist, chemical engineer, and explosives chemist. The salaries range from $2,600 to $5,600 a year. For all, appropriate college study and experience are required. The age limit has been raised to 60 years for regular probational appointment. Provision is also made for the waiver of age and physical requirements for temporary positions connected with the national defense program.

In chemical engineering there is a shortage of qualified people in plant layout, equipment design, market analysis, chemical economics, heavy chemicals, plastics, rubber, agricultural by-products, and strategic materials. Applicants may substitute college teaching in chemical engineering or chemistry for part of the prescribed experience. Copies and application forms may be obtained at first- or second-class post offices or from the U. S. Civil Service Commission, Washington, D. C.

U. S. Treasury Seizes 97 Per Cent of General Aniline Stock

Vesting in the Secretary of the Treasury of 97 per cent of the outstanding shares of General Aniline & Film Corp. of Delaware has been announced by the U. S. Treasury Department. The shares seized were registered in Dutch and German names, and the Treasury said the real interest in all these shares was German. The purpose in vesting the shares was to carry forward recent steps to Americanize the company, better utilize the productive facilities, and protect the investment of American bondholders of the company.

While 95 per cent of the common and preferred stock of the corporation was foreign owned, about the same percentage of outstanding bonds and debentures are held by United States nationals. Outstanding debentures approximating $18,000,000 are guaranteed by the German I. G. Farben. Co. Question of the ultimate disposition of the property is being left open.

Said H. S. Williamson, company vice president, "We've been praying for a long time that someone would act and clear us of uncertainty. It's a pleasure to be working for Uncle Sam."

New Fumigant Kills Insects in Stored Grain and Flour

A new fumigant for grain and flour, highly penetrating and deadly to insects but harmless to humans, is announced by the University of New Hampshire. The compound, chlorinated nitroethane, is a clear liquid with a distinct but not disagreeable odor, stated to be safe to ship in ordinary containers. It evaporates readily on exposure to the air, and the fumes penetrate quickly even into large masses of grain or flour. A simple method of fumigating grain in cars consists of putting the chemical on top of the grain and then sealing the car.

PUBLIC INFORMATION, OTTAWA| WIDE WORLD PHOTO

Camouflaged Laboratory Units

These camouflaged trucks, shown in the English countryside, carry equipment of the No. 1 Canadian Chemical Warfare Defence Laboratory, where chemists and doctors are ready to identify gas the enemy might use and give treatment to casualties. They are completely mechanized, protective units. A feature of the chemical laboratory is the fume cupboard in which lethal chemicals can be examined without danger to workers. Chemical officer is Captain L. B. Macpherson who was in Banting Institute, Toronto, for five years preceding the war. In foreground is a water decontaminator.

BOOKS for Today's Problems

RUBBER, PLASTICS AND RESINS

Chemistry and Technology of Rubber — by Carroll C. Davis and John T. Blake. A. C. S. Monograph $15.00

Science of Rubber — Edited by Prof. Dipl.-Ing K. Memmler — Translated by R. F. Dunbrook & V. N. Morris 15.00

Latex, Its Occurrence, Collection, Properties and Technical Applications — by Ernst A. Hauser 4.00

Polymerization and Its Applications in the Fields of Rubber, Synthetic Resins, and Petroleum — by Robert E. Burk, Howard E. Thompson, Archie J. Weith and Ira Williams. A. C. S. Monograph 7.50

Chemistry of Synthetic Resins — Set in 2 Volumes — by Carleton Ellis 19.50

Chemistry of Synthetic Surface Coatings — by William Krumbhaar 4.00

Plastics and Molded Electrical Insulation — by Emile Hemming 6.00

Casein and Its Industrial Applications — by Edwin Sutermeister and Frederick L. Browne. A. C. S. Monograph 6.50

Systematic Survey of Rubber Chemistry — by Clayton W. Bedford and Herbert A. Winkelmann 8.00

PETROLEUM, FUELS AND LUBRICANTS

Chemistry of Petroleum Derivatives — by Carleton Ellis
Volume I $18.00
Volume II 20.00

Modern Methods of Refining Lubricating Oils — by Vladimir A. Kalichevsky. A. C. S. Monograph 6.00

Lubricating Greases: Their Manufacture and Use — by E. N. Klemgard 15.00

Conversion of Petroleum, Production of Motor Fuels — by Thermal & Catalytic Processes — by A. N. Sachanen 6.00

Motor Fuels: Their Production and Technology — by Eugene H. Leslie 6.00

Shale Oil — by Ralph H. McKee. A. C. S. Monograph 4.50

The Reactions of Pure Hydrocarbons — by Gustav Egloff. A. C. S. Monograph 16.75

Physical Constants of Hydrocarbons — by Gustav Egloff. A. C. S. Monograph
Volume I 9.00
Volume II 12.00

Catalysis — Inorganic and Organic — by Sophia Berkman, Jacque C. Morrell and Gustav Egloff 18.00

Emulsions and Foams — by Sophia Berkman and Gustav Egloff 8.50

METALLURGY

Protective Coatings for Metals — by R. M. Burns and A. E. Schuh. A. C. S. Monograph $6.50

Silver in Industry — Edited by Lawrence Addicks. Sponsored by the Silver Producers' Research Project with the active cooperation of the National Bureau of Standards and many universities and scientific organizations 10.00

Corrosion Resistance of Metals and Alloys — by Robert J. McKay & Robert Worthington. A. C. S. Monograph 7.00

Tin — Its Mining, Production, Technology and Applications — by C. L. Mantell. A. C. S. Monograph 5.25

Beryllium: Its Production and Application — Translated by R. Rimbach & A. J. Michel 10.00

Bearing Metals and Bearings — by W. M. Corse. A. C. S. Monograph 5.25

Sampling and Analysis of Carbon and Alloy Steels. Prepared by The Chemists' Committee of the Subsidiary Companies of the U. S. Steel Corp. 4.50

Sheet Steel & Tin Plate — by R. W. Shannon 5.00

Textbook of Metallography, Chemistry and Physics of the Metals and Their Alloys — Gustav Tammann 7.00

Titanium, With Special Reference to the Analysis of Titaniferous Substances — by William M. Thornton, Jr. A. C. S. Monograph 3.75

Zirconium and Its Compounds — by Francis P. Venable. A. C. S. Monograph 3.00

Arsenical and Argentiferous Copper — J. L. Gregg. A. C. S. Monograph 4.00

Molybdenum, Cerium and Related Alloy Steels — by H. W. Gillett & E. L. Mack. A. C. S. Monograph 4.25

FOOD AND NUTRITION

We Need Vitamins — by Walter H. Eddy and G. G. Hawley $1.50

What are the Vitamins? — by Walter H. Eddy 2.50

Minerals in Nutrition — by Z. T. Wirtschafter 1.75

Outlines of Food Technology — by H. W. von Loesecke 7.00

The Vitamins — by H. C. Smith & S. L. Smith. A. C. S. Monograph 6.00

Mineral Metabolism — by A. T. Shohl. A. C. S. Monograph 5.00

Fundamentals of Dairy Science — by Lore A. Rogers. A. C. S. Monograph 6.00

Animal As a Converter of Matter and Energy — by Henry P. Armsby & C. Robert Moulton. A. C. S. Monograph 3.50

Marine Products of Commerce, Their Acquisition, Handling, Biological Aspects and the Science and Technology of Their Preparation and Preservation — by Donald K. Tressler 12.00

Comprehensive Survey of Starch Chemistry — by Robert P. Walton 10.00

MISCELLANEOUS

Chemical Action of Ultraviolet Rays — by Carleton Ellis and Alfred A. Wells. 2nd Ed. by Francis F. Heyroth $12.00

Uses and Applications of Chemicals and Related Materials — by Thomas C. Gregory 10.00

Condensed Chemical Dictionary — 3rd Ed. Edited by Thomas C. Gregory 12.00

Industrial Solvents — by Ibert Mellan 11.00

Industrial Chemistry, an Elementary Treatise for the Student and General Reader. 3rd Ed. by Emil Raymond Riegel 5.75

Modern Practice in Leather Manufacture — by John A. Wilson 9.50

Soilless Growth of Plants — by Carleton Ellis and Miller W. Swaney 2.75

We Can Save Money for Users of

DISTILLED WATER

by chemical treatment

WITHOUT HEAT!

OPERATION — Water passes through two reactor tanks. A chemical reaction in first tank removes positive ions, such as calcium, magnesium, and iron, substituting hydrogen. Water then passes to second tank where the hydroxyl (OH) ion is substituted for negative chloride and sulphate ions, etc. This OH ion then combines with hydrogen to form H_2O. The minerals removed from water are retained in reactor tanks until flushed to drain. Treated water contains small amounts of dissolved carbon dioxide gas which can be dispelled easily by aeration

1,000 gallons for less than a dollar!

Water produced the ILLCO way replaces heat-distilled water at *a fraction of the cost* — and meets the *exacting standards* of pharmaceutical houses, chemical plants, distilleries, and all other industrial concerns requiring purified water.

Completely automatic (between periodic regenerations) — water is not evaporated so no heat is required — pipes will not lime up — minimum maintenance cost. A unit delivering 300 gallons an hour occupies space about 4 x 10 feet. Made of finest material to protect purity of water. Available in units affording from 150 gallons an hour to 10,000 gallons an hour.

WRITE FOR FULL FACTS. *Get complete details of operation and examples of remarkable savings. No obligation whatsoever. Send for data today!*

Fertilizer materials	1.272	1.287	1.415

[a] Source of statistics in first seven items: Federal Reserve Board.
[b] Preliminary figures.
[c] U. S. Department of Labor.
[d] Rise in chemical price index for January is due to increased price ceilings on acetone, denatured alcohol, *N* butyl alcohol, acetic acid, and fats and oils. These increases, announced by OPA during late December and early January, included changes in base prices of acetone from 7 cents to 15.8 cents per pound, *N* butyl alcohol from 10.75 cents to 15.8 cents, SD2B from 24.5 cents to 50 cents per gallon, and an approximate 11 per cent increase in fats and oils prices.
[e] Drug price increase is due principally to camphor (9 per cent rise) and quinine sulfate (6 per cent rise).

Hercules Permits Use of Vinsol in Cement without Royalty

THE series of steps leading to elimination of scaling of concrete highways from freezing and thawing has finally been completed through dedication to public use by Hercules Powder Co., Wilmington, Del., of the patents covering the use of Vinsol resin in cement. This action will make it possible for manufacturers to make the material an ingredient of their cements without payment of royalties.

The resin is used to reduce surface scale and almost completely eliminate progressive scale, the company says. Laboratory and field tests have determined that additions of extremely small quantities of Vinsol in the range of 0.03 to 0.05 per cent to highway cements would produce concrete highly resistant to frost action.

Chemical Manufacturers' Indexes

THE index of the value of chemical manufacturers' inventories for December 1941 was 143.9 compared with 132.0 in November and 117.3 in December 1940, taking 1939 at 100, according to the monthly survey of the U. S. Department of Commerce.

The index of the value of chemical manufacturers' shipments for December 1941 was 170 compared with 176 in November and 124 in December 1940, taking January 1939 at 100, the same tabulation shows.

Chemists Assist in Training Air-Raid Wardens

CHEMISTS generally have been interested in the problem of training air-raid wardens and disseminating information that would be helpful in an air raid.

From San Francisco comes news that Milton J. Polissar has been made director of training of the air-raid warden service and has prepared plans adopted by the civilian defense authorities. The task involves training 3 ,000 wardens, which rests on the simple principle of spreading the necessary work so that a large number of persons may participate. Each will be assigned a task which those competent to judge think he can do best.

Chemists of San Francisco were asked to register with the professional division of the Civilian Defense Volunteer Organization, personnel managers were asked to bring the request to the attention of members of the professional staff including engineers as well as chemists, and members of the AMERICAN CHEMICAL SOCIETY were asked to call the activity to the attention of nonmember chemists and engineers. The 30,000 air-raid wardens are entering their training without delay.

Should others be interested in obtaining full details of this work, Dr. Polissar can be reached at the Civilian Defense Volunteer Headquarters, 532 Market St., San Francisco, Calif.

Hercules Builds Unit for Rubber Reclaiming Materials

DEVELOPMENT of rubber reclaiming solvents, plasticizers, and tackifiers derived from the southern pine will help alleviate a growing shortage of these materials, according to Hercules Powder Co., Wilmington, Del. The company is constructing a new unit at its Brunswick, Ga., naval stores plant for the manufacture of Tarol and Solvenol, rubber solvents and plasticizers. Existing equipment used in production of other naval stores products is being converted to manufacture the materials in anticipation of greater demand for rubber reclaiming materials.

Reclaim production in the United States advanced from 210,000 long tons in 1940 to approximately 280,000 in 1941, and will probably go over 300,000 in the current year. The 1941 output of reclaim amounted to over 25 per cent of the total United States rubber production.

ALTHOUGH Chile has been producing 2,500 metric tons of calcium carbide annually since 1936, imports in fluctuating amounts are reported. For the first eight months of 1939 these were 920 metric tons; of 1940, 1,630 metric tons; and of 1941, 770 tons.

Keep YOUR PLA OPERATING while laying Carey Elastite INDUSTRIAL FLOORING

★

This Modern, HEAVY-DUTY Flooring meets Demand for ALL-OUT Economical Production

To speed production—get rid of rough, dangerous, energy-wasting floors—surface them with CAREY ELASTITE Industrial Flooring. Lay it during week-ends; use it immediately. Prevent shutdowns; save time.

Smooth and resilient under foot, CAREY ELASTITE increases workers' efficiency. A printing concern found, that since application of this flooring, two men easily move a 4,000 lb. skid of paper which previously required four to five men for the job.

CAREY ELASTITE Industrial Flooring is TOUGH, long-wearing, non-skid, dustless; lessens accidents and breakage of trucks and tools. It is fire-resistant; practically noiseless under steel-wheel traffic. Its favorable first cost, long service and low maintenance, reduce floor overhead.

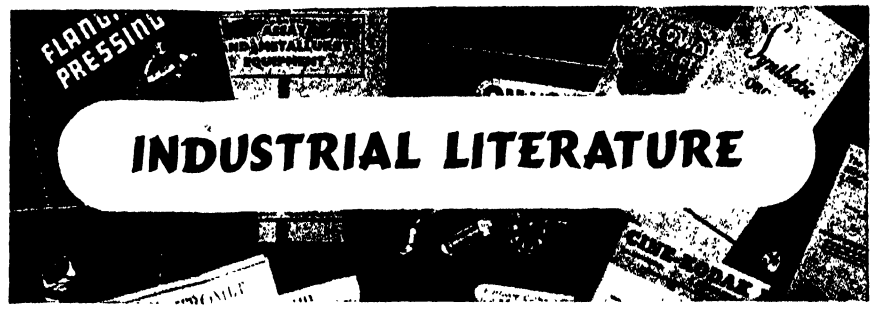
Guard YOUR WATER SUPPLY SYSTEM

Beware of sabotage! Remember, in an emergency, your water system may save highly valuable materials, buildings and even lives.

Neglect is almost as destructive as sabotage. If your water supply system is not in tip top order, call in Layne and have necessary repairing and reconditioning done at once. Materials, except for strictly war work, may not be available later. Maintaining present equipment is real conservation.

If you require more water, arrange for additional wells and pumps without delay. Better call in a Layne engineer. He will cooperate with you in planning your additional water supply so as to use the minimum amount of materials essential to war work, yet give you an adequate, efficient and long lived installation. Layne wells and pumps are designed for your requirements regardless of size. They are noted for their high efficiency and trouble free service. They are serving all types of industries, municipalities both large and small, army and navy needs, training camps, flying fields and munitions plants.



Write, wire or telephone for further facts.

Listed publications should be requested directly from the company concerned. Use business stationery, mention bulletin numbers, and refer to this journal. Publications will be sent free unless otherwise noted.

Air-Conditioning Equipment. A new 12-page catalog describes portable and fixed conditioning units, dehydration, refrigeration, and heating equipment. *Catalog AC-152 IE.* CARRIER CORP., South Geddes St., Syracuse, N. Y.

Ammonia Absorption Systems. A recently introduced absorption refrigeration system is described and shown diagrammatically in this 4-page bulletin. Using low cost heat as a source of energy, this system utilizes a bubble column rectifier that delivers commercially pure anhydrous ammonia to the evaporator. *Bulletin 4140 IE.* YORK ICE MACHINERY CORP., York, Penna.

Automatic Control of Condensate Purity. An 8-page bulletin covers an automatic continuous analyzer of the conductivity of condensate. This instrument assembly consists of a cell mounted in the condensate line and a signalling control. *Catalog N-95-163(1) IE.* LEEDS & NORTHRUP Co., 4907 Stenton Ave., Philadelphia, Penna.

Bearing Covers. A 4-page pamphlet is devoted to standard covers for ball and roller bearings. Flat, medium, and deep covers in two types of fastening flange, lug and round, are described. *Bulletin 11-C IE.* R-S PRODUCTS CORP., 4530 Germantown Ave., Philadelphia, Penna.

Centrifugal Dryers. A continuous feed, mechanical centrifugal dryer, that has been used for many years by the coal industry for the removal of excess surface moisture, has been redesigned and provided with an improved drive and feeding arrangement. This dryer is the subject of a new 4-page bulletin. *Bulletin 741 IE.* MCNALLY PITTSBURGH MFG. CORP., 307 North Michigan Ave., Chicago, Ill.

Condensate Return System. A high-pressure return system is described in this 4-page bulletin. This system is said to assure positive removal of condensate and complete elimination of entrailed air from process equipment. It also permits the return of the condensate to the boiler at close-to-process temperatures. *High-Pressure Return System Bulletin IE.* COCHRANE CORP., Philadelphia, Penna.

Drum and Barrel Carriers. This folder shows the many features of an all-metal barrel and drum carrier. A series of illustrations shows the various ways in which the carrier is used in the plant. Three different sized carriers are described. *Ernst Magic Drum and Barrel Carrier Folder IE.* ERNST MAGIC CARRIER SALES Co., 1456 Jefferson Ave., Buffalo, N. Y.

Feed-Water Treatment. A new organic, protective, and reactive colloidal material is announced in this 4-page folder. This product is used in conjunction with such inorganic chemicals as phosphates or alkalies. *Tanalginate Folder IE.* BIRD-ARCHER CO., LTD., 400 Madison Ave., New York, N. Y.

Flexible Tubing. An 8-page bulletin is devoted to flexible tubing as used in connection with Diesel installations. Tubing is described, and tables of dimensions are given for such products as exhaust pipes, air intakes, and supply lines. This tubing meets specifications of the United States government departments. *Bulletin 71 IE.* PENNSYLVANIA FLEXIBLE METALLIC TUBING CO., 72nd St. and Powers Lane, Philadelphia, Penna.

Gages. A 66-page catalog presents a complete line of gages, recording gages, and testing equipment. Sizes from $2^1/_2$-to 24-inch dial are described. Each gage or tester is illustrated. *Catalog 1000 IE.* ASHCROFT GAUGE DIV., MANNING, MAXWELL & MOORE, INC., Bridgeport, Conn.

Hypochlorination of Water. A series of four bulletins describes units for the automatic injection of sodium hypochlorite directly into the pipe, ahead of the storage tank. These units are made to operate electrically, by gas engines or by coupling to the water meter. *Bulletins DEF, DEL, DU-S, and 116 IE.* % PROPORTIONEERS, INC. %, 9 Codding St., Providence, R. I.

Insulation Materials and Products. A 52-page catalog contains information and recommendations on high- and low-temperature insulations for nearly every industrial need. Included are refractory materials, insulated roofs, electrical panels, flooring, packaging and gaskets, pipe insulation, and many other products. *Form GI-6A IE.* JOHNS-MANVILLE, 22 East 40th St., New York, N. Y.

Lubricant Measuring and Distributing Valves. This bulletin describes a multiple measuring valve which provides positive lubrication to small machines. These valves are in the form of blocks in which are incorporated an indicator and a quantity adjustment for each bearing connected to the system. A series of dimensional drawings is included. *Bulletin 7317 IE.* FARVAL CORP., 3261 East 80th St., Cleveland, Ohio.

Overnight Concrete. This 16-page

STEAM JET EVACTORS
AIDING NATIONAL DEFENSE

Numerous Croll-Reynolds Evactors are working overtime maintaining high vacuum in plants making explosives, synthetic rubber, airplane lubricants and a long list of other ordnance materials. They are maintaining high vacuum on engines and turbines of dozens of American ships sailing the seven seas.

While the large and special units require up to three months or more for fabrication the smaller ones are sometimes made in two weeks, or less, when the demand is urgent. These include single and multi-stage units for vacuum up to a small fraction of 1 mm. absolute, also small condensers and vacuum chilling equipment.

A recent development is a vacuum-cooled condenser for maintaining condensing temperatures down to 34° F. Inquiries will be handled as promptly as possible under the circumstances.

Recover strategic materials to meet production requirements

Production and *more production* is the problem faced by industry everywhere Meeting the ever-increasing demands of war has put a strain on raw material supplies.

MULTICLONE collection of values conserves raw materials and makes for still greater production In the chemical, metallurgical, and food industries, just to mention a few, MULTICLONES are proving their recovery value day after day In one molybdenum plant alone the value recovered each day pays for the cost of the MULTICLONE Here are some of the things that make MULTICLONES outstanding

LOW DRAFT LOSS SAVES POWER • COMPACT AND FIRE-PROOF • EASY TO ERECT, EASY TO INSPECT COLLECT FINE PARTICLES FROM HOT OR COLD GASES

They are compact and may be located in otherwise useless space.

They have a common inlet and outlet which simplifies the flue system and makes a neater and more economical installation.

A common dust discharge simplifies the handling of collected material

Of all-metal construction, they are fire-proof and can be used for the collection of fine particles from either hot or cold gases

MULTICLONE assemblies of 6", 9", or 24" diameter tubes provide a range of collection efficiencies to meet your every requirement.

MULTICLONES made of non-corrosive materials meet every requirement for cleaning, inspection or sterilization in process industries.

NECROLOGY

Fred W. Upson

FRED W. UPSON, dean emeritus of the Graduate College, University of Nebraska, and former chairman of the Department of Chemistry and Chemical Engineering, died February 10 at Lincoln, Nebr. He had been in failing health for the past three years.

Dr. Upson was born in Byron, Ill., in 1883 and received his bachelor's and master's degrees at the University of Nebraska in 1907 and 1908. In 1910 he was awarded his doctor's degree by the University of Chicago. After two years as an instructor in chemistry at the University of Cincinnati and one year at the University of Chicago, Dr. Upson joined the faculty of the University of Nebraska as professor of agricultural chemistry. In 1918 he became chairman of the Department of Chemistry on the city campus, and in 1929 was made dean of the Graduate College. Both of these positions were held until he retired in 1939.

Professor Upson was well known for his numerous researches in carbohydrate chemistry. He had been a member of the AMERICAN CHEMICAL SOCIETY.

Alan G. Wikoff

ALAN G. WIKOFF, editor-in-chief of the General Publicity Department of Union Carbide and Carbon Corp., New York, died February 11 at the age of 46. Mr. Wikoff was graduated from the College of the City of New York with the degree of bachelor of science in chemistry in 1916 and received his master's degree in chemical engineering from Columbia University in 1917. During World War I he was connected with the Chemical Warfare Service for two years. On returning to civilian life he was associated in an editorial capacity with the McGraw-Hill Publishing Co., Inc., for six years. For the past 17 years, he had been associated with Union Carbide and Carbon.

Mr. Wikoff was a member of the AMERICAN CHEMICAL SOCIETY, American Welding Society, and International Acetylene Association.

WE announce with regret the death of the following A. C. S. members:

James J. Conlon, emeritus professor of chemistry, Santa Barbara, Calif. Member since 1913.

H. W. Foote, professor, Yale University, New Haven, Conn. Member since 1908.

Raymond Freas, associate professor of organic chemistry, Tulane University, New Orleans, La. Member since 1934.

R. Clinton Fuller, retired, Providence, R. I. Member since 1902.

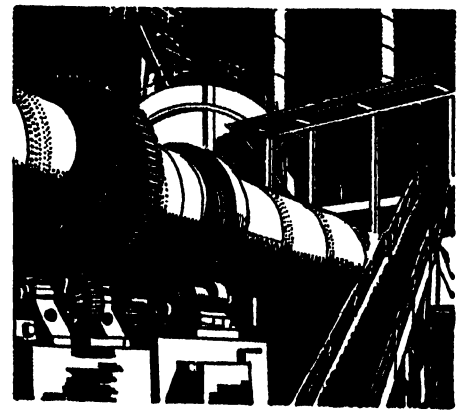
John M. Grove, chief chemist, Carlisle Tire & Rubber Co., Lancaster, Penna. Member since 1920.

George B. Heckel, editor and publisher, *Drugs, Oils & Paints,* Philadelphia, Penna. Member since 1909.

John H. P. Ioannu, research chemist, Pennsylvania Salt Manufacturing Co., Philadelphia, Penna. Member since 1927.

Theodore Kipp, vice president, Kipp-Kelly Ltd., Winnipeg, Canada. Member since 1921.

Bradley H. Kirschberg, director of scientific laboratory, New York State Police, Bureau of Criminal Investigation, Schenectady, N. Y. Member since 1941.



Ludwig Pincussen, research associate, University of Illinois College of Medicine, Chicago, Ill. Member since 1941.

Cooperation for Production

ANOTHER example of American productive ingenuity and the way business is cooperating in the national drive for war production was revealed by the recent action of the Aluminum Co. of America and the Anaconda Wire & Cable Co.

Following the Pearl Harbor attack and the declaration of war upon the Axis, the Aluminum company was faced with the immediate diversion of the major part of its aluminum production to the manufacture of planes. This resulted, among other things, in some idle cabling machinery designed to manufacture electrical wire and cable. At the same time, the Anaconda Wire & Cable Co. found its facilities pushed to the utmost to supply the increased war demand for electrical wires and cables of copper, especially cabling machinery.

Competitive interests were shelved for the duration, and in the shortest possible time, this cabling machinery was turned over to Anaconda Wire & Cable Co. for a figure substantially under its original cost.

"DRYING OIL" WORRIES?

PETROPOL 2138, the unsaturated petroleum oil with Iodine Number over 200, is partially substituting for "drying oils" in many industries. PETROPOL 2138 dries by polymerization and oxidation to a hard film.

SPECIFICATIONS

Specific Gravity	.993	Iodine Number (Wijs)	200 minimum
Pounds per gallon	8.27	Saponification No.	1.0 maximum

Color — dark brown — transparent in thin film

Miscible in all proportions with drying oils and petroleum solvents

Available in quantity at low prices.

Anhydrous Aluminum Chloride in Organic Chemistry. *Charles Allen Thomas.* A. C. S. Monograph. 972 pages. Reinhold Publishing Corp., 330 West 42nd St., New York, N. Y., 1941. Price, $15.

An inevitable concomitant of war is the need of speed in production and research. The availability of tools is probably the limiting factor in accelerating the tempo of activities. Dr. Thomas in "Anhydrous Aluminum Chloride in Organic Chemistry" has provided a tool of inestimable value to research chemists in the field of organic chemistry.

The book is a timely and strategic contribution to our chemical literature. The present value of the work rests not only on its comprehensiveness and thoroughness, but also on its utility. During the present emergency, when our expanding chemical industry finds it necessary to build and man new plants, this work will expedite the review of the voluminous literature pertaining to the diverse and complex reactions catalyzed by aluminum chloride.

In addition to chapters on the production and purification of aluminum chloride and its physical properties, the book discusses the mechanism and chemistry of the various reactions catalyzed by this chemical. Some of the titles are Alkylation and Arylation Reactions, Ketone Syntheses, Ring Closure, Addition Reactions, Aldehyde Syntheses, Rearrangements and Migrations, and Polymerizations. A recital of chapter headings cannot, however, adequately set forth the comprehensiveness of the work. The tabulated data at the beginning of chapters show the scope of certain reactions and present a bird's-eye view of their possibilities.

The author was confronted with a genuine task relating to chemical nomenclature. The reactions catalyzed by aluminum chloride were to a large extent discovered and reported before there was general agreement on terminology. Frequently identical compounds were reported by three or four different names, and Dr. Thomas and his associates have done a creditable job of bringing order out of chaos.

Progressive chemical organizations will see to it that Thomas' book on "Anhydrous Aluminum Chloride in Organic Chemistry" is made available to their research staffs.

TITRATION LAMP

Supplies soft, glareless fluorescent illumination of daylight quality, correct intensity and color characteristics to beakers in which titrations are being carried out.

Reflector is vitreous enameled and fitted with snapswitch, connecting cord and plug. Length, 12½ inches; height, 8 inches; depth, 4½ inches. Operates from 115 volt 60 cycle circuits.

S-44290 Lamp, Titration, Sargent. With fluorescent tube.....13.00

CHICAGO ILLINOIS

Solubilities of Organic Compounds. Vol. II. *Atherton Seidell.* 3rd ed. 926 pages. D. Van Nostrand Co., 250 Fourth Ave., New York, N. Y., 1941. Price, $10.

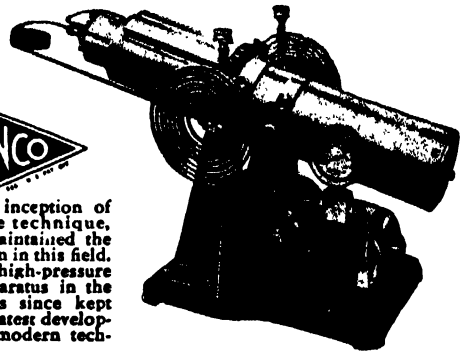
VOLUME I of this set, devoted to quantitative solubility data of inorganic and metal organic compounds was reviewed in the NEWS EDITION [18, 1162 (1940)]. This review may be referred to for a description of the mechanical make-up of the book and the ingenious method in which the material was assembled.

Publication of Volume II, which deals with quantitative solubility data of organic compounds, permits one to compare the compass of the second edition with that of the completed third edition. The latter contains 86 per cent more pages that the former work.

This volume is no mere compilation of solubility tables, for these are supplemented by notes on the technique involved in the determinations. References are given to results obtained by other workers in the field.

Excellent author and name indexes are included, and the method of classification in itself supplies an adequate formula index. References to the original literature are given in the author index.

Considering the invaluable service rendered by the various chemical societies and the International Union of Chemistry in attempting to bring order out of the chaotic condition of chemical nomenclature, spelling, and formulas, the reviewer regrets that the compiler has not conformed to accepted usage in these respects. Hyphens have been omitted in such names as *p*-nitrobenzene. The prefixes chlor and chloro are used interchangeably as in chloracetic acid and chlorobenzene. Spaces have been left between parts of words as in chlor ethane and chlor iodo nitro benzene. The term molecular, not empirical, formula should have been used in the preface. While such criticisms may seem trivial, the reviewer feels strongly that conformity to accepted usage should be observed in chemical publications. However, the usefulness of the compilation is in no way impaired by these meanderings from the straight and narrow path. The balance weighs heavily on the side of the great mass of valuable data which the author has so painstakingly assembled for works in many fields. Congratulations are once more in order.



COLIN M. MACKALL

The Men Who Make the Future. *Bruce Bliven.* xiv + 325 pages. Duell, Sloan & Pearce, Inc., 270 Madison Ave., New York, N. Y., 1942. Price, $3.00.

TO REVIEW this book for the readers of CHEMICAL AND ENGINEERING NEWS is a

SUPERPRESSURE
& Catalytic Hydrogenation
EQUIPMENT

YOUR needs for laboratory or pilot plant apparatus employing high pressures and temperatures for the investigation of catalytic chemical reactions and other phenomena can be met successfully by Aminco technicians. A special shop department is maintained for producing designs in high-strength materials for all phases of superpressure technique.

AMINCO

Ever since the inception of superpressure technique, Aminco has maintained the leading position in this field. It built the first high-pressure laboratory apparatus in the U. S., and has since kept abreast of the latest developments in this modern technique.

The bomb shaker illustrated was designed by Aminco for the synthetic hydrogenation of organic substances.

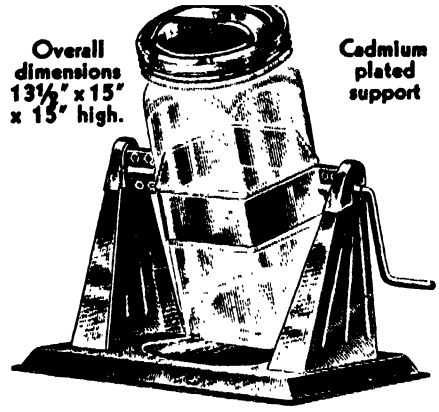
difficult task, since its intended audience is a very different kind. Mr. Bliven is a journalist of wide experience, and his book presents his views and opinions of science as a moving, vitalising force in our modern world. In assembling the material for the present volume, he has proceeded in a characteristically journalistic manner to collect and collate interviews with many persons in all the principal scientific forefronts. The product is essentially a layman's view of scientific progress and prospects assembled and written in a workmanlike manner. The fields of science explored are many and varied. The style is interesting.



One could easily criticize the title, since the volume is in no sense biographical and direct quotations are more than usually scarce. One might find fault with the relative emphasis placed on various phases of the broad subjects treated. One might even disagree with some of the author's preachments on how scientists should behave toward world affairs and how the world should regard scientists. But those are decidedly minor considerations.

It is healthful and stimulating for scientists to read books like this from time to time. Whether one agrees completely with all of its statements and conclusions is not significant. But it is important that scientists should occasionally see themselves and their activities in the mirror of an intelligent person's thoughts. That the book seems to me to be, and as such it is well worth while.

Inorganic Chemical Technology. W. L. *Badger* and *E. M. Baker*. Chemical Engineering Series. 2nd ed. 238 pages, 6 × 9 inches. McGraw-Hill Book Co., Inc., 330 West 42nd St., New York, N. Y., 1941. Price, $2.50.

THIS very important book has been revised by substitution in many places and hence without any considerable enlargement. It presents the manufacture of important heavy chemicals, such as acids, alkalies and salts, from the viewpoint of the chemical engineer and under American conditions. Various unit operations particularly evaporation and absorption are skillfully and adequately tied in with the manufacturing sequences. To keep within its pages principally up-to-date procedure, older and obsolete processes have been omitted or revised in places.

Both the second and the first editions of this book have impressed the reviewer because of the clarity and skill with which the subjects have been presented. This book is not an all inclusive manual, but anyone interested in salt, alkali, sulfuric,

TUMBLE-MIX

Literally 1001 Lab Uses

ORIGINALLY devised for a specific use — thousands manufactured under mass production — hence the unbelievably low price. Worth triple its price, as its use in any lab is certain to prove. Excellent for mixing, blending, dispersions — liquids or powders — even offers limited use as ball mill. Heavy molded glass jar, 1½ gallon capacity, with 5½" dia. screw top, to admit many bottles, vials, capsules, metal sample containers. Tin-foil lining inside cover. Easy to clean — jar instantly removable from base. Rigid, pressed steel support, cadmium plated for rust and corrosion resistance. Easily converted to motor drive. *Order yours today!*

VALUE.. *far beyond low price of only..* $7.95

ELIMINATE DELAYS

WITH

Barnstead Automatic Distilled Water Outfits

With a Barnstead completely automatic still you always have right on tap an ever-ready supply of fresh, pure distilled water. You never have to wait. And you never have to question the purity of your water. These stills keep storage tanks filled at all times with freshly distilled water — without any manual attention. They are self-starting and self-stopping. They are even self-flushing.

Send for catalog describing not only these completely automatic stills but all the other Barnstead water stills that are serving thousands of laboratories and industrial plants.

nitric, and hydrochloric acids and evaporization should not fail to study the presentation made by Badger and Baker.

As was true in the first edition, the illustrations are unusually well drawn and indeed one third of the present illustrations are new or have been revised. Copious references and problems help adequately to supplement the text. Particularly noteworthy additions involve the concentration of sulfuric acid, contact process, oxidation of ammonia, potash recovery, and soda ash.

R. NORRIS SHREVE

Papers on Organic Analytical Reagents

THE January 1942 issue of *The Virginia Journal of Science* contains reports and papers presented at the Third Symposium on Organic Analytical Reagents held May 2, 1941, at the Richmond meeting of the Virginia Academy of Science. Contents of the January number are:

JOHN H. YOE AND LANDON A. SARVER. Inorganic Analysis with Organic Reagents.

THIRD SYMPOSIUM ON ORGANIC ANALYTICAL REAGENTS

JOHN H. YOE. Introduction.

W. J. FRIERSON AND PALMER M. SIMPSON. Progress Report on Reactions of Organic Compounds with Inorganic Ions.

F. T. LENSE, C. A. GLOVER, AND EDWIN C. MARKHAM. Progress Report on Investigation of Organic Compounds as Reagents in Analytical Chemistry.

LANDON A. SARVER. Salinogenic Organic Reagents.

IRA A. UPDIKE, OSCAR W. CLARKE, JR., AND RICHARD M. IRBY, JR. Progress Report on Studies in Inorganic Analysis with Organic Reagents.

JOHN ROBERT TAYLOR. Progress Report on Studies of Organic Compounds as Analytical Reagents.

JOHN ROBERT TAYLOR. Note on Ferric Ion Phenol Color Reaction.

JAMES W. COLE AND M. BROOKS SHREAVES. Some Complex Compounds of Copper, Silver, and Mercury with Ethanolamines.

E. LOUIS WALLACE AND ALFRED R. ARMSTRONG. Progress Report on Inorganic Analysis with Organic Reagents.

THOMAS B. CRUMPLER AND EARL R. CLAIBORNE. Progress Report: Reaction between Silver and Guanidyl Thiourea Carbonate.

JOHN H. YOE. Selected Bibliography on Organic Analytical Reagents.

A number of chemists who are not members of the Virginia Academy of Science may like to have a copy of the symposium number of the journal. A few extra copies have been printed and can be obtained at 50 cents each while they last. Orders should be sent to Lt.-Col. Robert P. Carroll, Managing Editor, *The Virginia Journal of Science*, Lexington, Va.

Contributions to Chemical Education

THE *Journal of Chemical Education*, Brown University, Providence, R. I., has announced plans to publish a series of "Contributions to Chemical Education". The principal purpose will be to supply students and teachers of chemistry with cheap but authoritative monographs on subjects of interest or importance to them. The first two of the series have already appeared: No. 1, "Acids and Bases"; No. 2, "The Polarographic Method of Analysis". The first is a collection of papers, most of which were previously published in the journal. The second is the reprinted series of articles in the journal by Otto H. Müller. Further contributions will be published from time to time, in the form of either original or reprinted titles. Three others are already in various stages of preparation. They will be inexpensively but attractively printed in a uniform size and format.

It is hoped that this series will aid the journal materially in its primary aim—to provide a living and continuing textbook of chemistry.

National Canners Research Report

THE annual report to the Research Committee of the National Canners Association Research Laboratories, Washington, D. C., has been issued, prepared by E. J. Cameron and J. R. Esty. One of the year's principal activities has been control of spoilage through laboratory examination of ingredients used in canning and by bacteriological surveys during the canning season. The tin conservation project was continued in 1941. Many of the usual functions of the laboratory are said to apply doubly in an emergency, particularly in view of the tremendous demand from war agencies for canned foods.

Articles and Patents on Molecular Distillation

IN CONNECTION with its work on the molecular distillation of the glycerides and minor constituents of soybean oil, the U. S. Regional Soybean Industrial Products Laboratory during the past several years has assembled a file of patents and journal articles dealing with all phases of molecular distillation. Recently the laboratory has made available, in mimeographed form, abstracts of this literature for the use of other workers interested in applying this physicochemical tool to research in other fields of organic chemistry.

Abstracts of nearly 160 patents are included, arranged in groups under parent patents. In addition, mention is made of more than 110 research reports, descriptions of apparatus, reviews, etc. Adequate indexes are provided.

This publication is identified as ACE-115 (RSLM-55), entitled "Abstracts of Articles and Patents on Molecular or Short-Path Distillation", and may be obtained free, as long as the supply lasts, upon request to the U. S. Regional Soybean Laboratory, Urbana, Ill.

Special Subscription Rates to Chemical Society Publications

BY SPECIAL agreement for reciprocal discounts, members of the AMERICAN CHEMICAL SOCIETY may subscribe to publications of The Chemical Society for 1942 at the following rates, including postage.

Journal of The Chemical Society	£2.15.0
Annual Reports on the Progress of Chemistry for 1941, Volume XXXVIII	12.6
British Chemical and Physiological Abstracts	
Section AI (General, Physical, and Inorganic Chemistry)	2.10.0
Section AII (Organic Chemistry)	2.10.0
Section AIII (Physiological and Biochemistry)	4.10.0
Sections AI and AII together	4.10.0
Sections AI and AIII, or AII and AIII together	6.0.0
Sections AI, AII, and AIII together	7.10.0

Application for these publications should be made to the General Secretary, The Chemical Society, Burlington House, Piccadilly, London, W. 1, England.

Booklets on Civilian Defense

IN CHEMICAL AND ENGINEERING NEWS for January 25, page 125, we suggested that chemists and chemical engineers equip themselves with copies of texts issued by the Office of Civilian Defense: "Protection against Gas", "First Aid in the Prevention and Treatment of Chemical Casualties", "Training Guide for Decontamination Squads", and "Handbook for Decontamination Squads".

These publications are distributed by the Office of Civilian Defense, the Washington address of which is DuPont Circle Apartments, and by its local offices throughout the country. Inquiries should not be sent to the Chemical Warfare Service.

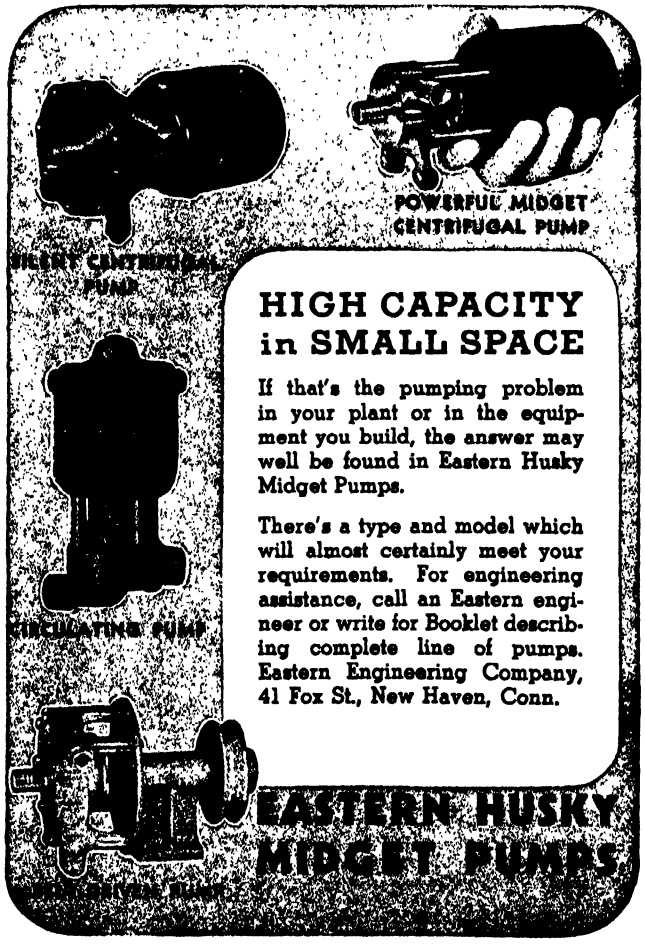
Report on Glues, Gelatins Available

GLUES, Gelatins, and Related Products", issued by the U. S. Tariff Commission in 1940, comes into prominence in the present war situation. The publication details data pertinent to industrial capacities, production, uses, substitution, and trade. It indicates both the extent to which the United States is dependent on foreign sources for raw materials consumed in the output of some of the products, as well as the ability of the country to produce its total requirements of others from domestic raw materials. The report illustrates the importance of the finished products to the defense program.

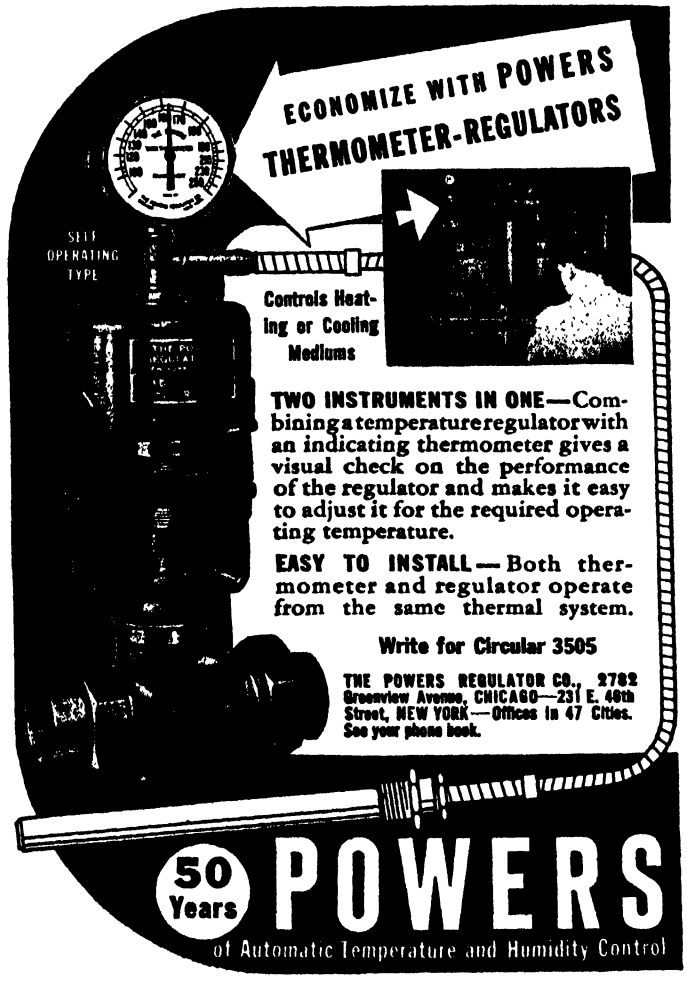
The report may be purchased from the Superintendent of Documents, Government Printing Office, Washington, D. C., at 25 cents per copy.

THE WALL STREET OF CHEMISTRY

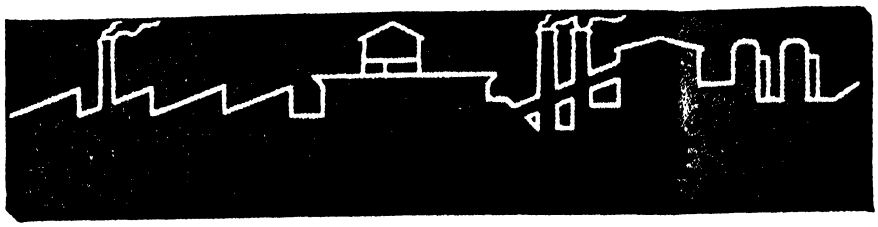
	Annual Earnings		Per Common Share	
	1940	*1941*	*1940*	*1941*
Blaw-Knox Co.	$ 1,360,747	$ 1,668,311	$ 1 02	$ 1.25
Commercial Solvents Corp.	2,387,321	2,615,453	0.91	0.99
Dayton Rubber Mfg. Co.	518,897	710,291	2.41	3 50
Industrial Rayon Corp.	2,392,477	2,311,711	3.15	3.04
Johns-Manville Corp.	5,882,071	5,967,145	6 35	6.66
Mathieson Alkali Works	1,587,812	1,743,628	1.72	1.90
New Jersey Zinc Co.	8,236,815	9,592,871	4 19	4.88
Owens-Illinois Glass Co.	7,223,034	9,040,148	2.71	3.40
Pennsylvania Salt Mfg. Co.	1,701,333	1,688,457	11.34	11.26
Sylvania Industrial Corp.	1,148,602	1,150,650	2 72	2.75
U. S. Rubber Co.	11,425,241	13,662,658	3 58	4 86



The **Commercial Solvents Corp.** in its report for the year ending December 31, 1941, states that throughout the year sales were limited only by capacity to produce. Net sales for 1941 were $24,664,166, compared with $15,844,930 for 1940. Federal income and excess profits taxes for 1941 were $2,728,296, compared with $691,168 in 1940. The ratio of current assets to current liabilities on December 31, 1941, was 6.1 to 1, compared with 8.9 to 1 on December 31, 1940. During the year $554,090 was invested in new facilities, the major item being $197,710 for a new building at Terre Haute to house the Research Department.

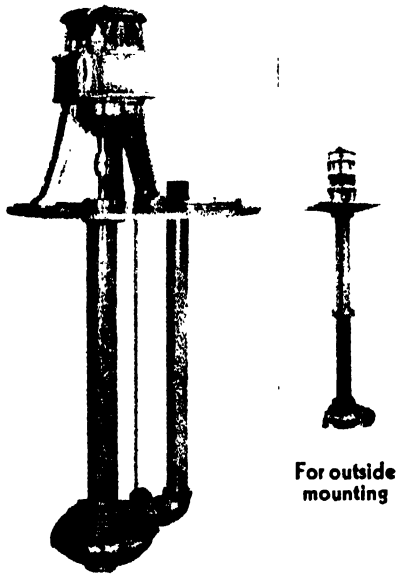


E. I. du Pont de Nemours & Co., Inc., expended $50,600,000 for plant construction in 1941. The much lower figure of $50,600 for du Pont construction, as reported in Chemical and Engineering News for February 25, page 302, was brought about by an error of the journal's staff rather than by any change in du Pont policy.



The **Industrial Rayon Corp.** in 1941 reported earnings only slightly under those for 1940, in spite of increased taxes amounting to $3,395,081. Capacity operations at the Painesville plant, together with an increase in prices in the fall, are said to be responsible for the favorable showing. As a result of the expansion at Painesville, output of yarn there has increased 8,000,000 pounds a year.

The **Liquid Carbonic Corp.** has filed with the SEC a registration statement covering 30,000 shares of cumulative preferred stock, series A, $100 par value. Proceeds are to be used to make a partial prepayment of $700,000 on a promissory note due in 1948 and to add to the general funds of the company.



The **U. S. Rubber Co.** reports that net sales in 1941 established a new record at $315,300,000 and were 38 per cent higher than in 1940. The previous peak was $256,100,000 in 1920. Taxes amounted to $18,800,000 in 1941, almost three times those for 1940. The spread of war to the company's plantations was responsible for a charge of $1,400,000 against earnings in 1941, as a reserve for estimated war losses in Malaya, the Philippines, and elsewhere in the Far East. Facilities for the production and use of reclaimed rubber have been increased, and a large plant for production of synthetic rubber is being constructed under contract with the Defense Plant Corporation.

Vertical Acid and Chemical Pumps

For outside mounting

Pump for inside mounting

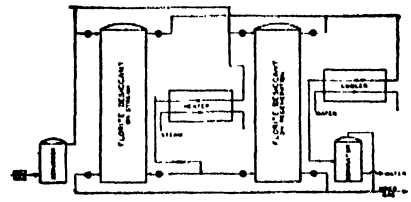
VERTICAL acid and chemical pumps, built by the Lawrence Machine and Pump Corp., Lawrence, Mass., to pump various acids and in sizes from 1 to 6 inches, depending on capacity, may be mounted either inside or outside of tank. A considerable number have been furnished to ordnance and explosives plants.

International Filter Selects New Name

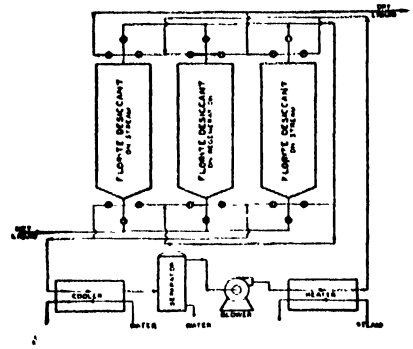
AFTER 48 years, International Filter Co., Chicago, has changed its name to Infilco, Inc. The name was an obvious selection, says P. N. Engel, president. Infilco, an abbreviation of the old name, was adopted as the registered trade mark more than 10 years ago. To new acquaintances, the name Infilco avoids the untrue inference of the old name—that the company's principal product is filters—and to old friends, Infilco is a streamlined version of a name associated during the past half century with new developments in chemical precipitation, coagulation and clarification, silica gels, as well as water-conditioning equipment.

Carrier Organizes New Marketing Plan

A MARKETING plan to expedite the handling of war business, to simplify field operations, and to bring closer cooperation between dealers and branches is announced by Carrier Corp., Syracuse, N. Y. The United States east of the Rocky Mountains is divided into three districts—Eastern, Western, and Southern. James A. Bentley, vice president of Carrier, becomes head of the Eastern Region; Arthur P. Shanklin, recently elected vice president, heads the Western Region; and O. W. Bynum, until recently southwestern district manager, has charge of the Southern Region.



Headquarters for the Eastern Region will be New York; the Central Region, Chicago; and the Southern Region, Dallas. Each regional executive will be responsible for all operations in his area and together the regional heads will form an advisory council to E. T. Murphy, vice president in charge of marketing.



Repeating Cycle Timer

THE periodic purging of condensate from certain types of curing or molding equipment is also beneficial in creating adequate heat distribution. Mechanical and thermostatic traps often fail to set up the steam circulation necessary. To handle effectively this purging, a Taylor repeating cycle timer has been developed by the Taylor Instrument Cos., Rochester, N. Y.

This unit, also known as the blow-down timer, is used in conjunction with a diaphragm motor-operated reverse-acting condensate valve. With suitable temperature or pressure control on the application, it permits the admission of fresh steam without affecting an appreciable pressure change within the apparatus.

Granular Drying Agent

Above. Dehydration plant for gases.
Below. Dehydration plant for liquids.

FLORITE desiccant, a new granular drying agent for gases and liquids, has recently been placed on the market by the Floridin Co., 159 Liberty St., Warren, Penna.

Its outstanding characteristic is ability to maintain a high drying efficiency under difficult conditions. It adsorbs water instantly and will not swell, disintegrate, or appear wet at the end of an adsorption cycle. It is hard, stable, noncorrosive, and nonpoisonous.

Pomona Pump Co. Acquires Westco

POMONA PUMP CO. announces the acquirement, as of February 1, of Micro-Westco, Inc., Bettendorf, Iowa. Plant equipment and personnel will be transferred to Pomona's No. 2 plant at St. Louis, where the manufacture of the entire line of Westco pumps will be continued. Distribution will be through the same national organization that has carefully been built up by Micro-Westco during the past 20 years.

* Nominal.

EMPLOYMENT INFORMATION

RATES to be paid in advance. Standard setting 5c a word, minimum charge $2.00 each; include 8 words for box address. Exceptions see ⟶ Display, $10.00 per column inch. 2 inches maximum, larger units at regular display unit rates. No discounts or allowances.
SEND advertisements with remittance to INDUSTRIAL AND ENGINEERING CHEMISTRY, 332 West 42nd St., New York, N. Y., to reach there not later than 10:00 A.M. on the 10th and 25th, closing dates for NEWS EDITIONS of the 25th and 10th, respectively. Insertions made in order of receipt provided necessary remittances are complete.
Employers are requested to mention in their announcements the section of the country in which the open position is located to ensure replies only from those who are geographically available.
In printing these advertisements the SOCIETY assumes no obligations as to qualifications of prospective employees or responsibility of employers.

Unemployed members of the AMERICAN CHEMICAL SOCIETY seeking employment for themselves are allowed in one calendar year 3 free announcements, one per issue, set in standard style and limited to 50 words each, including 8-word box address. Excess words 5c each. Additional standard announcements 50% of regular rate.

Employed members of the AMERICAN CHEMICAL SOCIETY seeking new positions are permitted 3 standard announcements during the calendar year at 50% of the regular rate—include 8 words for box address.

Employers seeking chemists and chemical engineers are permitted 3 standard announcements, not to exceed 50 words each including box address and not more than one per issue, during the calendar year without charge, provided they agree in writing to acknowledge all replies (excess words 5c each), otherwise full rate applies.

The AMERICAN CHEMICAL SOCIETY is vitally interested in the welfare of its members and in seeing that the chemical industry is manned with competent chemists and chemical engineers. These pages are part of our service in that connection. In addition most of the larger sections of the AMERICAN CHEMICAL SOCIETY and several of the smaller ones have active employment committees. Local section secretaries in your area will inform you as to any employment aids that may be available locally.

An Employment Clearinghouse is operated at each national meeting of the SOCIETY for the purpose of bringing together representatives of industry looking for chemists and members and student affiliates in attendance wishing to make such contacts. For further details, consult the preliminary and final programs as printed in the NEWS EDITION prior to each meeting.

In the New York area, special employment facilities are offered by the Employment Bureau of the Chemists' Club, 52 East 41st St., New York, N. Y. In the Chicago area, the Chicago Section maintains an employment service at 413 Stevens Hotel, Chicago, Ill.

Those replying to announcements should be careful to send copies and not original documents. Advertising circulars will not be forwarded and to that end all letters will be opened at the forwarding office.

SITUATIONS OPEN

Those announcements in which the letter "P" is part of the address key have paid in full and are not committed to acknowledge replies. The Society regards acknowledgment by employers of all applications as an act of common courtesy but can assume no responsibility for their failure to do so.

EXECUTIVES, CHEMICAL ENGINEERS AND CHEMISTS with exceptional backgrounds of experience should use our confidential and individual method of contacting responsible employers. No limit to territory. We negotiate all overtures. Established 1915. The National Business Bourse, 20 W. Jackson Blvd., Chicago, Ill.

GRADUATE ASSISTANTSHIPS at the University of Maine. Applicants may work half time toward the master's degree in chemistry or chemical engineering. Remuneration $500 plus tuition for twelve hours' laboratory instruction per week for the school year. Applicants should be in the upper quarter of graduating class. All applications must be received before March 15 and should include complete personal data, photograph, official transcript, preferred research field and three reference letters.
Box 11-N-2, Ind. & Eng. Chem., Easton, Pa.

ANALYTICAL CHEMIST. With advanced degree and 3 years' experience in biochemical field. Experience with tobacco analysis highly desirable but not essential. Give personal data, qualifications, salary expected and enclose photograph in first letter.
Box 30-N-2, Ind. & Eng. Chem., Easton, Pa.

WANTED IMMEDIATELY, Chemical Engineer or Mechanical Engineer with working knowledge of inorganic chemistry, as assistant in directing operations. Experience in leaching, evaporation, and electrodeposition desirable but not essential. Location near Pittsburgh, Pa. Send full particulars and photograph with first letter.
Box 17-T-2, Ind. & Eng. Chem., Easton, Pa.

BACTERIOLOGIST, M.S. or Ph.D., with 3-5 years' applied experience in the field of sanitation and disinfection wanted by prominent eastern manufacturer for research and development work. Creative ability must be established. Consideration will be given only to those who fully meet the above requirements. In replying give full academic industrial and personal background. Transcript of academic record, scientific and personal references, and recent photograph will be requested.
Box 25-TP-2, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER with at least five years' commercial experience to work in plastic field, principally in production but also in design of equipment for plastic operations. Plant located in the Midwest. Sound training and experience required. State qualifications, salary expected and recent photograph.
Box 59-TP-2, Ind. & Eng. Chem., Easton, Pa.

THREE ORGANIC Chemists M.A. degree 1941 or 1942 preferred wanted for organic research developing new uses and products for organic chemical manufacturer. Submit full details concerning education, scholarship, experience, personal data, references, draft status, and recent photo. State salary desired. Address Post Office Box 460, Niagara Falls, N. Y.

RESEARCH FELLOWSHIPS in Wood chemistry available September 1942 for M.S. candidate. Full time research and study. Stipend $50 per month for nine months. Bachelor degree in chemistry or chemical engineering required. Address applications to Dean D. S. Jeffers, University of Idaho, Moscow, Idaho.

PHYSICAL CHEMIST. Eastern A. C. S. approved college with modern well equipped laboratory and library needs instructor for next academic year. Candidate should be less than 28 years old, preferably single, with a Ph.D. from leading university. Instructor will have light teaching load, and plenty of opportunity for research.
Box 103-T-2, Ind. & Eng. Chem., Easton, Pa.

TEACHING FELLOWSHIPS in chemistry, State College of Washington; master's and doctor's programs in organic, inorganic, analytical, physical, and physiological chemistry. One-half time assisting, stipend $450, plus out-of-state tuition.
Box 104-T-2, Ind. & Eng. Chem., Easton, Pa.

CHEMIST B.S., knowledge of spectroscopy. Woman preferred. Experience preferred but not essential. Give complete details of age, race, religion, education, experience, and salary expected. Send picture. Eastern central location.
Box 14-N-3, Ind. & Eng. Chem., Easton, Pa.
